California State Library

EXTRACT

From an Act prescribing Rules for the Government of the State Library, passed March 8th, 1861.

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

SEC. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General and the Trustees of the Library.

JAN. 1, 1870—Price Reduced to $4, and name of paper abreviated to "Scientific Press."

Mining and Scientific Press Circular, 1869.

U. S. AND FOREIGN

PATENTS

Caveats,

PATENT LAW

And the Rights of Inventors.

Dewey & Co.,

Patent Agents and Publishers

MINING AND SCIENTIFIC PRESS.

OFFICE 414 CLAY ST., SAN FRANCISCO.

BRANCH OFFICES IN

WASHINGTON, D. C., LONDON,
PARIS, MELBOURNE,
AND IN OTHER FOREIGN CITIES.

Foreign Patents.

In addition to American patents we secure, with the assistance of co-operative agents, claims in all foreign countries which grant patents, including Great Britain, France, Belgium, the Netherlands, Prussia, Austria, Russia, Spain, British India, Saxony, Sardinia, Norway, Sweden, Mexico, Victoria, Baden, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, British India, Wirtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where patents are obtainable.

Our schedule prices for obtaining foreign patents, in all cases, will be as low as those of any other reliable agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

Many valuable and important inventions of Americans are being yearly surreptitously patented in foreign countries, some of which governments allow it, thus debarring those who have valuable inventions from their rights.

Assignments.

We make out assignments in the most substantial legal and improved forms, record the same in the Patent Office at Washington, and return the papers to the assignee, at a total cost of $5.

Assignments of extra length or of a special character, will be made out and recorded on the most favorable terms.

Assignments already made will be examined and opinions rendered regarding their validity, and the assignments recorded, when desired, for a moderate fee.

Re-Issues.

When, through "inadvertence, accident, or mistake," an *insufficient* or *defective* patent has been issued, the defects in the Specification and Claims can be remedied by a *re-issue*. In order to obtain this, the inventor, or the holders of the patent, must surrender the patent, and file an amended specification and drawings, and a statement specifying the ground for asking for a re-issue. Re-issues are generally applied for after it has been found that the patent could not withstand litigation. It is, therefore, especially desirable that the new Specification and Claims should be prepared with great care and skill. Terms liberal in these cases.

Unsuccessful Applicants

Who are not satisfied with the reference sent to them from the Patent Office, or are dissatisfied with the transactions of their agents, can have their cases thoroughly examined and reported on, by sending us their power of attorney so to do, for a small expense, at most. This can be done without revoking the power of other agencies or in any manner prejudicing the interests of the inventor. Cases which have been resting a long time in the Patent Office have been successfully undertaken by us to the great satisfaction of inventors. Parties who know themselves to be the first and true inventors of valuable inventions should not give up their chances, without investigation, simply because patents have been wrongfully issued to others.

Our Office.

The office of the MINING AND SCIENTIFIC PRESS is located in the second story at No. 414 *Clay* street, north side, just below Sansome. Here we have spacious accommodations, with our patent rooms, editorial room, counting room, and newspaper printing office,—all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number—414 Clay street, below Sansome.

Home Counsel.

We are frequently consulted by persons who have rejected cases which they sent months previous through distant agencies—(hastily paying their first and last government fees, expressage, and extraordinary charges of agents)—when we could have shown in the start precisely similar drawings and descriptions in the Patent Office Reports in our office, thus saving such applicants their useless expenditure of money and their long suspense.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive free advice of importance to them, from a short call at our office.

In Our Library

We have the only complete set of U. S. Patent Office Reports (from 1844) on this coast; a full record of all patents issued since 1790; Record of British patents from 1801, and full files of scientific papers containing illustrations and list of U. S. Patent Claims; Illustrated Mechanical, Philosophical, and Law Books and Reports, of the very highest authority, forming the only extensive library of patent works west of the Rocky Mountains. We offer patentees and inventors the free use of these books at our office. The files of the MINING AND SCIENTIFIC PRESS contain the claims of the Pacific Coast Patents, and many illustrated descriptions of the same. We have also in our office *full copies* of a large majority of the patent cases emanating on the Pacific Coast.

Interferences.

INTERFERING APPLICATIONS are conducted with spirit and ability on the most favorable terms, by DEWEY & CO. It sometimes happens that an applicant finds his invention has been patented by another, but more recent discoverer. In such cases the prior discoverer can obtain full right to the invention if he can produce tangible evidence of priority.

When patentees are threatened with interference they should consult able and responsible agents before they either allow themselves to be backed down from their rights, or trespass upon the rights of others. We will always counsel and advise in such cases upon the most reasonable terms—often saving clients heavy damages and exorbitant fees.

Copies of Patents.

Full copies of U. S. Patents will be furnished in the shortest time possible, at favorable rates.

Copies of the claims of U. S. Patents will be furnished without delay, from the reports in our office, at trifling expense. State the name of patentee and assignees, and date and No. of the patent, if possible.

Copies of Patents in foreign countries expeditiously furnished at moderate rates.

EXTENSIONS.—U. S. Patents issued prior to 1861, are subject to extension for seven years, provided some ostensible reason can be shown the Government for so doing. Patentees who have, from circumstances beyond their control, been deprived of the full benefit of their patents for any considerable time, are usually successful in obtaining an extension of the same, when presented through our agency.

INFLUENCE AT WASHINGTON.—No inventor can possibly have better facilities or more influence (through friends or agents, at Washington or elsewhere), to secure their patents sooner or more surely, than ourselves. Our influence at Washington is unrivalled, so far as success for applications from the Pacific States and Territories are concerned.

DEWEY & CO.

American and Foreign

Patent Agents.

No. 414 Clay Street,

SAN FRANCISCO.

Patents Obtained Promptly.
Caveats Filed Expeditiously.
Patent Reissues Taken Out.
Assignments Made and Recorded in Legal Form.
Copies of Patents and Assignments Procured.
Examinations of Patents made here and at Washington.
Examinations made of Assignments Recorded in Washington.
Examinations Ordered and Reported by TELEGRAPH.
Rejected Cases taken up and Patents Obtained.
Interferences Prosecuted.
Opinions Rendered regarding the Validity of Patents and Assignments.
Every Legitimate Branch of Patent Agency Business promptly and thoroughly conducted.

San Francisco.

CIRCULARS FREE.

Illustrate your Inventions.

One of the best means—and the cheapest, too—for eliciting attention to a new invention, is that of illustrating and describing it in the columns of the MINING AND SCIENTIFIC PRESS. To do this in the case of a meritorious improvement (and none other will be accepted), will cost our patrons no more than the price of a first-class engraving.

Superior Engraving Done.

We also take especial pains in furnishing engravings and electrotypes of superior merit, of all kinds, at fair rates, and tender our patrons the benefit of our practice and experience, by advice and assistance, in getting up their circulars, advertisements, etc.

With a poor representation we desire to have nothing to do, as it would be calculated to injure both the inventor and ourselves.

Too many ingenious inventors lose the product of their genius and labor by not bringing their improvements conspicuously or plainly enough before the public—the general reading public.

Reasons for Success.

We would especially call the attention of the inventive public to the fact that our Patent Agency is taking out a larger number of Patents than any other agency west of the Mississippi River. We do our work promptly and thoroughly, and refer to our standing amongst inventors as an evidence of our success in our special department. Our work is all done inside of our office, BY COMPETENT AND RELIABLE PERSONS, who have been for years interested and associated with us. We therefore are not compelled (like many agencies) to trust valuable and important inventions promiscuously to outsiders, to have part of the case prepared, but inventors can depend that, from the time their cases are first placed in our office, they are kept with proper secrecy until full rights are secured in the Patent Office in Washington. This is an important point in the proper prosecution of Patent business. It is a notorious fact that some prominent agencies trust a considerable portion of their cases to apprentices and amateurs. A deficiency or want of attention to the small affairs of any kind of business will often prove as harmful as a flagrant violation of the most important rules which govern and control it.

Volunteer Compliments.

From an endless series of appreciative testimonials and frank acknowledgements, we give the following:

SAN FRANCISCO, May 5, 1869.—MESSRS. DEWEY & CO. Gentlemen:—Allow me to express to you many thanks for services rendered me in procuring my patent, which has just come to hand. I would also say that your work has been faithfully done, and your advice and representations have in all cases been honest and truthful.

Respectfully, GEO. INWOOD.

SAN FRANCISCO, April 19, 1869.

MESSRS. DEWEY & CO., Patent Agents.—*Gentlemen:*—Allow me herewith to tender you my sincere thanks for the efficient assistance you have rendered me in securing my patent, and other papers, as well as the promptness and energy displayed by you in our business transactions. Very respectfully yours, C. E. JAYCOX.

We have had frequent occasion to have business relations with the patent agency connected with this establishment, and have had nothing left to desire in regard to it. Fidelity, promptness and courtesy, soon arranged everything for us to our complete satisfaction. Having had frequent delays at Washington while in that city, we have been surprised at the promptitude with which some of our friends obtained their patents through the agency of MESSRS. Dewey & Co.—*S. F. Spiritual Light.*

GRASS VALLEY, Dec. 2, 1868—*Messrs Dewey & Co:*—Having received the patent for Symons & Co's Tossing and Refining Concentrator, through your Agency, we return our sincere thanks to you for your unrivalled success. Yours, respectfully, SYMONS & HARRY.

LEXINGTON, April 3, 1869.

DEAR SIRS:—The Letters Patent have just come to hand. For the prompt and business-like manner with which you have put the matter through, please accept my thanks. GEO. W. TEASDALE.

To DEWEY & CO., Publishers M. & S. Press.

STOCKTON, April 8th, 1869.

MESSRS. DEWEY & CO.:—Your favor of the 6th inst., accompanying patent for improvement in horse shoes, is received. I beg you will accept the earnest assurance of my gratitude for your kind assistance and valuable services. Very truly yours, W. R. WATSON.

Subscribe for the

Mining and Scientific Press.

PUBLISHED EVERY SATURDAY,

—BY—

DEWEY & CO.,

414 Clay Street, San Francisco.

If you are an Inventor, Patentee, Miner, Farmer, Manufacturer, Mechanic, or a progressive Student or Artisan in any Industrial or Professional Calling in the Pacific States or Territories, you are doing yourself irreparable injustice, if not already a subscriber and reader of the MINING AND SCIENTIFIC PRESS.

It contains hints and information enough to repay the subscription price many times in a single month.

Its columns are filled with instructive reading in plain, comprehensible and attractive form to minds of ordinary intelligence.

It contains 16 pages and 64 columns of the size of Harpers's Weekly, and is the best printed and most valuable paper on the western half of the continent. All claims of patents issued to inventors on this coast are reported. Illustrations of new machinery are given each week. Descriptions of new inventions and discoveries throughout the world, are given, with fresh and comprehensive information of scientific developments and mechanical and industrial progress, which cannot be obtained from books, or readily found gathered in so convenient a form elsewhere. Subscribe now, and you will not regret it.

OPINIONS OF THE PRESS.

MINING AND SCIENTIFIC PRESS.—The Mining and Scientific Press, published at San Francisco by Dewey & Co., is one of the most valuable of our exchanges.

Miners, mechanics, and the reading public generally, will find its regular perusal profitable and interesting.

Its scope and purpose are expressed in the title, and we recommend miners and mechanics in particular to subscribe for it. Terms $5 per annum, in advance.—*Trinity Journal, March 13th.*

MINING AND SCIENTIFIC PRESS.—This useful and scientific journal has entered upon its eighteenth volume.

To the scientific, mechanic, and practical men of all classes it is almost invaluable; and we are glad to learn that it is increasing in patronage every day.

The publishers, Dewey & Co., San Francisco, say the present volume shall be superior in all respects to its predecessors.

The terms are $5 in advance, $3 for six months.—*San Bernardino Guardian, March 6th.*

THE PRESS is one of the most valuable and instructive papers published in the United States, and every miner, millman, machinist and foundryman should be a subscriber. The information to be derived from its columns is worth many fold times the subscription.—*Grass Valley National.*

MINING AND SCIENTIFIC PRESS.—This excellent scientific journal has entered upon its eighteenth volume.—*Chico Courant, Jan. 15th.*

THE *Mining and Scientific Press* should have an extensive circulation in every mining community on the Coast.—*Placer Herald, Dec. 19.*

W. FRANK STEWART is Dewey & Co's accredited agent for the Patent business in this city, and will attend to their affairs in that specialty.—*San Jose Mercury.*

MINING AND SCIENTIFIC PRESS.—This journal is devoted to mining and scientific researches, and has been conducted with great ability. It has been greatly enlarged and improved.—*San Jose Patriot.*

MINING AND SCIENTIFIC PRESS has become almost indispensable to the miner and machinist, and is well deserving of the patronage which we are pleased to learn it receives.—*Mariposa Mail, Jan. 10th.*

THE PRESS is a credit to the State, and is fast gaining in popularity. It commends itself to all classes, and we hope many in this section will become subscribers.—*Pajaronian.*

THESE gentlemen not only print a first-class scientific and mining journal, but are also trustworthy Patent Agents, and doing much towards the inventive business of this coast.—*San Jose Mercury.*

THE MINING AND SCIENTIFIC PRESS commenced a new volume with the new year. It is a credit to the State, and to the mechanic or miner, is a great source of valuable information. It has every appearance of prosperity, and we hope it may continue growing in wealth and influence.—*Pajaronian.*

WE CONSIDER THE MINING AND SCIENTIFIC PRESS the most valuable mining and mechanical newspaper issued in the United States. Dewey & Co., publishers, are also solicitors of foreign and American patents and conduct patent cases of every kind. We guarantee that all business confided to them will be carefully attended to, and we further believe that every miner, mechanic, and scientific man should have their valuable paper.—*Auburn Stars and Stripes.*

NEW VOLUME.—The MINING AND SCIENTIFIC PRESS has entered upon another year's work looking improved and promising. This paper is devoted to the interests of the scientific world, and to the miner and mechanic is almost invaluable.—*Gilroy Advocate.*

TO MINERS.—William H. Murray, traveling agent for the Mining and Scientific Press, published by Dewey & Co., of San Francisco, is in town soliciting subscriptions for that paper. To the intelligent miner, a paper like the *Press* is particularly valuable, keeping him posted on the latest discoveries in reduction of ores, new machinery, etc.—*Grass Valley National.*

MINING AND SCIENTIFIC PRESS.—We look upon this paper as one of our most valuable exchanges, in fact it deservedly stands at the head of all publications embracing mining, scientific and mechanical subjects, and contains much miscellaneous matter of interest, and is a gem of neatness. The PRESS is published by Dewey & Co., San Francisco, and at its present low price of five dollars per annum, should be patronized by every one, but more especially by miners, mechanics and inventors who wish to pursue their avocations with intelligence and economy.—*Tidal Wave, Idaho.*

THE MINING AND SCIENTIFIC PRESS has entered upon its XVIIth Volume. It has donned a new-style hat; or, in newspaper parlance, a new heading, which gives it the solid, scientific look it merits. Other improvements typographical are also noticeable. No call for improvement in its matter.—*Amador Ledger, July 18th.*

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on its subscription books.—*Nevada Gazette.*

Subscription, $5 per annum; $3 for six months—in advance. Sample copies free.

DEWEY & CO.,
U. S. and Foreign Patent Agents,
No. 414 Clay st., San Francisco.

(TURN OVER.)

Mining and Scientific Press Patent Circular.

To Inventors

ON THE

Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Established in 1860.

Our business has been long and successfully practiced, and we are thoroughly responsible for the confidence and valuable trusts placed in our charge. Our advice can always be relied upon as correct.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with and have full records of all former cases, and can more correctly judge of the value and patentability of inventions discovered here, than any other agents.

Steps Necessary to Procure a Patent.

The FIRST thing required is a model, if your invention can be represented by one. It is not only immediately necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions. A model of less size will answer when more convenient. It should be neatly made, of hard wood or metal, or both, and varnished or painted; the name of the inventor and the name of the article should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention, and the relation of the new to the old parts of the machine.

As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., *Mining and Scientific Press, San Francisco.* Prepay expenses and send express receipt to us by mail.

A full description must also be sent with the model, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operation.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by registered letter, post office order, or by draft on San Francisco, payable to our order. Always send a letter with the model, and with the remittance, stating the name and address of the sender. On receipt of the model and Government first fee of $15 in currency, the case is duly registered on our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and acknowledgement before a Notary Public or Justice of the Peace, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government last fee of $20 in currency will be required. The law states that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and at the expiration of two years the invention therein described shall become public property as against the applicant therefor.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, (unless they are of a common and well known character), and also of the manufactured article itself must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case the applicant has only to send us an exact description, and what it is desirable to claim.

For Designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances two photographs, with the negatives, answer well instead of drawings.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless the invention is one of great complication, usually the business can be well done by correspondence.

The usual time required to secure a patent, when the case is conducted at our agency, is from one to two months. We sometimes get them through in two weeks. In rare cases, however, owing to delay on the part of Government officials, the period is sometimes extended for months. We make a special point to advance our cases as rapidly as possible, and have been successful in obtaining patents for this coast more surely and speedily than any other agency in the United States.

Letters Patent and Who Can Obtain them.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or Foreigners, male or females, (including minors), and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

Citizens of Canada and Nova Scotia have to pay a fee of $500 for patents in the U. S., owing to discriminations made against Americans.

Important Advantages.

Some of the advantages to be obtained by patronizing us may be enumerated as follows:

Inventors on this coast having their applications for patents made out through our agency, can sign their papers at once, and thus secure their rights *much sooner* than by trusting the same to distant agencies, situated at New York or Washington.

Many inventions on this coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use. A personal verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

By an able and faithful representative of our firm in Washington, our clients' applications are guarded against indifferent examination, unfair treatment in any contingency, and hazardous delays.

Patents for inventors on this coast are actually secured cheaper through our agency than any other, however flattering may be the inducements offered at the commencement by others.

Extensive practice gives us great facilities, securing regularity in the transaction of our business, which extends to EVERY COUNTRY IN THE WORLD where patent laws exist.

We assist in bringing valuable inventions to the general notice of the public throughout the Pacific Coast by illustration or description in the columns of the MINING AND SCIENTIFIC PRESS.

Confidential Advice.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice we make no charge. A pen-and-ink sketch and description of the invention should be sent together with a stamp for return postage. Write plain, do not use pencil or pale ink; be brief.

Remember all business committed to our care, and all consultations, are kept by us secret and strictly confidential. Our permanent business interests demand, as it were, a sacred compliance with our obligations as solicitors, and in reference to our strict fidelity in this respect we refer to one and all of the thousands of inventors and patentees on this coast who have patronized us.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service.

A majority of the Patents issued during the past eight years to Pacific Coast inventors have been secured through our Agency; consequently we can more readily and correctly advise new applicants than any other agent.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing the documents for a case, presenting it to the Government, and attending to all business connected with it, is $25 and upward. For cases demanding extra work and attention, only a reasonable fee in accordance with the services required, to do full justice to the case, will be charged.

Following is the list of Government fees, payable in currency:

On every caveat	$10
On every application for a patent, for seventeen years	15
On every application for a design, for 3 yrs and 6 mos	10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	20
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Examiners-in-chief	10
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

By Telegraph.

In cases of immediate importance we can have their progress reported by telegraph, so that applicants know immediately the result of the examination and decision of the Patent Office. We also make examinations by telegraph regarding the patentability of inventions; examine patent assignments on record at Washington; obtain copies of patents or claims, and also derive other information desired instantly from the Patent Office.

Caveats.

A caveat is a description of the invention designed to be patented, lodged in the Patent Office before the patent is applied for, and while the inventor is perfecting his design. When *properly* made, it operates as a bar to applications respecting the same invention from any other quarter; but when improperly done, it is inoperative by reason of such defect. The Patent Office always returns a receipt for caveat papers, but does not seek to point out its incorrectness, unless there be some glaring defect.

Our fees for filing caveats are from $20 to $25. This covers the entire expense, including Government fee.

If worth filing at all, these cases should be prepared with very great care and caution.

To enable us to prepare caveat papers, we only require a sketch and a full and comprehensive description of the invention.

No model is required in filing a caveat. For this reason, and the fact that the cost is much less than for an application for a patent, it is in many cases advisable for American inventors to avail themselves of the privileges of our caveat system.

DEWEY & CO.

Mechanical Movements, from Dewey & Co's Free Illustrated Pamphlet.

PLATE I.

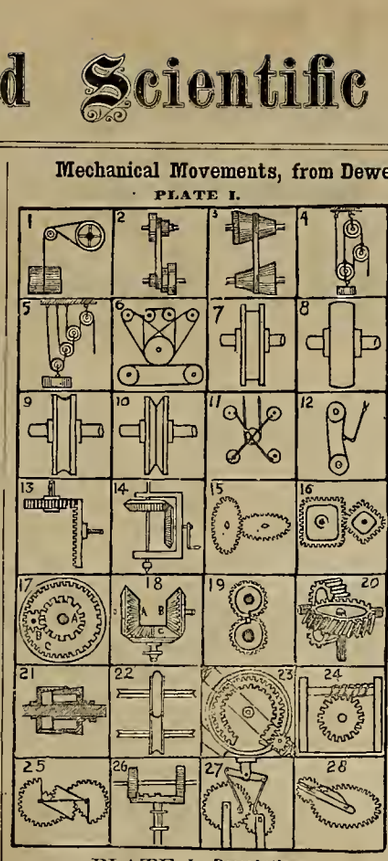

PLATE V.

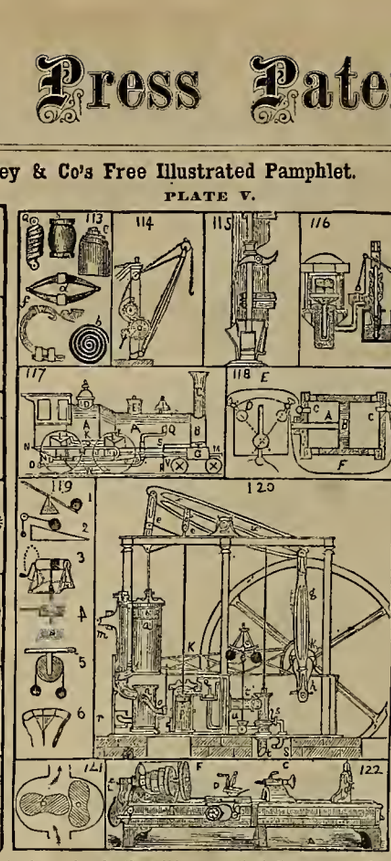

PLATE I.—Description.

1. Transmitting motion from a shaft at right angles to another, by means of two guide pulleys.

2 Cone pulleys for varying the speed of lathes, etc.

3. Cone-pulleys. Used in cotton machinery, affording a gradually increased or diminished speed.

4. A system of pulleys known as Spanish hartons.

5. Compound pulley. The effect of the whole will be equal to the number 2, multiplied by itself as many times as there are movable pulleys in the system.

6. Belts and pulleys.

7. A flange pulley for a flat belt.

8. A plain pulley for a flat belt.

9. A concave-grooved pulley for a round hand.

10. A smooth surface V-grooved pulley for a round hand or steel wire.

11. Several wheels, by connecting-rods driven from one pulley.

12. Lever with hearing roller to tighten hands.

13. "Crown-wheel" on the right gearing, with a "spur-gear."

14. Beveled gear.

15. Elliptic gears, for varying speed.

16. Rectangular gears, producing a varying speed.

17. Different velocity given to two gears, A and C, on the same shaft, by the pinion B.

18. A uniform intermittent rotary motion in opposite directions is given to the bevel-gears, A and B, by means of the mutilated bevel-gear, C.

19. Scroll-gears for obtaining a gradually increasing speed.

20 Oblique toothed wheels.

21. Friction cones. (Sectional view.)

23. Friction pulleys.

33. Revolving into reciprocating motion, by an endless segmental rack and pinion, the axle of which revolves and slides in a slot toward and from the rack. This rack is secured to a disk, and a rope round said disk extends to the body, to which a reciprocating motion is to be imparted.

24. Worm and worm wheel.

25. Transmitting motion, with three different velocities, by means of toothed segments of unequal diameters.

26. For similar purpose as 18.

27. Variable alternating traverse of the bar by the unequal gear wheels.

28. Revolving motion by a circular sliding pinion gearing in a elliptical cog-wheel.

PLATE V.—Description

113. The principal and most common variety of springs used in machinery: *a*, spiral spring; *h*, india rubber spring; *e*, the volute spring, made of sheet-steel wound, cone-shaped; *d*, elliptic spring; *f*, the C spring; *b*, coiled or watch-spring.

114. Common Derrick crane.

115. Sectional side view of a quartz mill battery. The mortar at the bottom is partly V-shaped, containing the die setting on the bed; stamp resting on the die; stem extending upward through the cross-timbers or guides; tapped on the upper part of stem resting on the cam that raises and drops the stamp, stem and tappet together at each revolution.

116. Hydrostatic press. Water forced by the pump on the right through the small pipe into the ram cylinder, and under the solid ram on the left, presses up the ram. The amount of force obtained is in proportion to the relative areas or squares of diameters of the pump-plunger and ram. Suppose, for instance, the pump-plunger to be one inch diameter and the ram thirty inches, the upward pressure received by the ram would be 900 times the downward pressure of the plunger. The same principle is applied in hydrostatic jacks, and for massive brick buildings.

117. Locomotive engine. The boiler, A A, and the engines, of which G is one cylinder, rest on the frame which extends from N to M, and contains the jaws and driving-boxes under the springs, as shown. The frame rests in front on the springs of the forward truck, of which X X are the wheels, and hangs behind on the equalizing beam K, extending to the springs. The circle H H represents the trailing-driver, and J J the leading-driver. B is the smoke-box, C the chimney, W the ash-pan, E the sand-box, and D the steam dome just forward of the cab. The line V G represents the piston-rod, U V the connecting-rod, and U U the parallel rod. T is the steam-chest, containing the valve; T S the valve-rod, and S R the rocker arms on the rock-shaft. The link-motion extends between the forward driving-shaft and the arm R, and, with R S T, forms the valve-gear. The pumps P (forward of leading-driver) draw water from the tender through the feed-pipe O P, and force it into the boiler through the check-valve Q.

118. Improved Lenoir gas engine—a French invention. The piston-head B is represented midway of the cylinder; A, piston-rod; a gas jet is introduced with a quantity of air sufficient for combustion at each end of the cylinder alternately, and ignited by an electric spark by conducting wires E and F at c c. The electric spark is generated at the proper moment by the poles of the galvanic battery becoming momentarily connected by revolution at D.

119. The six mechanical powers which are the basis of all mechanical movements and combinations: 1, lever; 2, inclined plane; 3, wheel and axle; 4, screw; 5, pulley; 6, wedge.

120. Condensing beam-engine. *a*, steam-cylinder; *b*, piston; *c*, upper steam-port or passage; *d*, lower steam-port; *e e*, parallel motion; *f f*, beam; *g*, connecting-rod; *h*, crank; *i i*, fly-wheel; *k k*, eccentric and its rod for working the steam-valve; *l*, steam-valve and valve-casing; *m*, throttle-valve; *n*, condenser; *o*, injection-cock; *p*, air-pump; *q*, hot-well; *r*, shifting-valve, for creating a vacuum in the condenser, previous to starting the engine; *s*, feed-pump for supplying the boilers; *t*, cold water pump for supplying the condenser cistern; *u*, governor.

121. Sectional view of Root's patent blower for furnaces, etc. Air is drawn in through the lower pipe and forced out in the direction indicated by the arrows by the rapid revolution of the double vanes which closely follow each other and the inner side of the shell or case containing them.

122. Engine lathe. Upon the shears, or framing, A, stand the fixed head-stock, M, (which carries the spindle and face-plate, F,) the movable tail-stock, C, and the compound rest, D, which is moved longitudinally by the lead-screw, actuated by the feed, L, and upon which stand the tool-stock and tool-rest.

Advertising and Subscription

Rates for the Mining and Scientific Press.

Subscriptions in Advance:—One year, $5; Six months, $3; Single copies 15 cents; Monthly Series, $5 per annum; QUARTERLY SERIES (stiff paper binding) $6 yearly.

Lowest Rates for Advertising:

We shall adhere to the following rates (payable in gold coin) for advertising in the MINING AND SCIENTIFIC PRESS from this date:

One column, one year	$400 00
Half column, one year	200 00
One column, six months	200 00
Half column, six months	100 00
One column, three months (13 weeks)	100 00
Half column, three months	60 00
Per line (smallest type) one year	3 00
Per line (50 lines or more) one year	2 40
Per line, three months	1 00
Per line (10 lines or more) three months	80
Per line, one month (4 weeks)	50
Per line (10 lines or more) one month	40
Per line, one week	25
Per line (10 lines or more) one week	20

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive forms; we will otherwise assist advertisers in getting up their notices, when desired.

☞All advertisements in the PRESS appear in both the ☞MONTHLY AND QUARTERLY SERIES of the MINING AND ☞SCIENTIFIC PRESS, which (by special arrangement) are ☞placed on FREE READING in the principal hotels, steam-☞boat and steamship saloons, depots, and public reading ☞rooms and libraries in San Francisco, and the Pacific ☞States. Many volumes are also bound, thus affording ☞permanent advertising.

The PRESS now receives the largest and best advertising patronage of ANY WEEKLY PAPER west of the Rocky Mountains.

In regard to the value of advertising in our journal, we refer with pleasure to those who can speak from experience—*our advertisers*. Better referees, or more reliable names, cannot be found in the advertising columns of any newspaper in the world.

FAMILIAR SCIENCE—Retention of Water in Vegetables and Fruit; Wasting Fuel; The Soil, etc.
MECHANICAL PROGRESS.—A New Form of Steel-Rails; Artificial Stone; A New Steam Pump; Tungsten Steel, etc.
SCIENTIFIC PROGRESS.—Source of Light in Flame; Ancient Human Remains; Chemical Action Arrested by Pressure, etc.
ENGINEERING.—Adams' Hydraulic Wheel; Mining; Public Surveys; Improvised Ditching Machine.
FARMING AND GARDENING.—Deformed Cattle; Crystallizing Flowers; Artificial Coloring of Plants; Cultivated and Utilizing of Oats; Horticulture in Greenland, etc.
MINING SUMMARY.—California, Arizona, Colorado, Idaho, Nevada, New Mexico, Utah and Wyoming.

Vorbe's Improved Combination Lock.

Combination locks are the perfection of mathematical and mechanical science. Unless the number, the cabalistic *open sesame* be known, the safe remains closed even to the confidential clerk in the office. But continued guessing and trying may, in the ordinary combination lock, succeed. Mr. Vorbe, of San Francisco, has brought mathematical science to the rescue, and made this next to impossible—or the work of a lifetime, and therefore not very likely to be undertaken. The graduated disks H, I, J, are set to any desired number, as in all the combination locks; and the mathematics of this very ingenious but simple invention is such that on missing the correct combination *once*, from carelessness or accident, a second attempt is practicable immediately; but if that fails too—evincing an unmistakable ignorance of the secret number,—the lock seems almost to exercise the intelligence of reason, and to become suspicious, for it will then be impossible to make another combination that could draw the bolt short of 50,000 turns of the knob, E, an eight or ten hours' job; there being possible, in all, 1,000,000 combinations. Such arrangement makes it a ridiculous undertaking to tamper with Mr. Vorbe's lock under any circumstances—and the holder of the secret number is, accordingly, absolutely secure.

So intricate is the mechanics of combination locks that those who are not familiar with the subject could not easily be made to comprehend the interior working, even from an engraving; though the essential parts are here shown in the sectional view. The operation of the lock may be described as follows :

Before locking the safe the small hands 4, 5, 6, 7 (Fig. 2) on the back of the lock, are turned around till they point to the dots shown on the lock plate outside their periphery ; this brings the wheels Q, R, S, T, into a position where, if moved, the pin of Q is ready to act on R, the pin of R on S, the pin of S on T, and one of the pins T on the lever Z.

To unlock the safe, the combination being known as 11, 70, 49, the knob E, (Fig. 1) is turned till the number 11 on the disk J corresponds with the index G′ on the plate K. The knob E is then turned back till the number 70 on the disk I corresponds with the mark *e* of the washer *j*, on the same line with the index G′. Then the knob is turned forward till the number 49, on the disk H, corresponds with the mark *e′* of the washer *i*. The key M is then inserted in the key-hole O′, in the knob F, so that it will hold the arms 1, 2, 3 opposite the grooves *w*′, of the segment W, (Fig. 1) and the knob F is turned, withdrawing the bolt U.

The setting of the numbers correctly brings the slots *m*′ (Fig. 2) in the tumblers, into a line with the sliding plate *r*′, so that as the knob

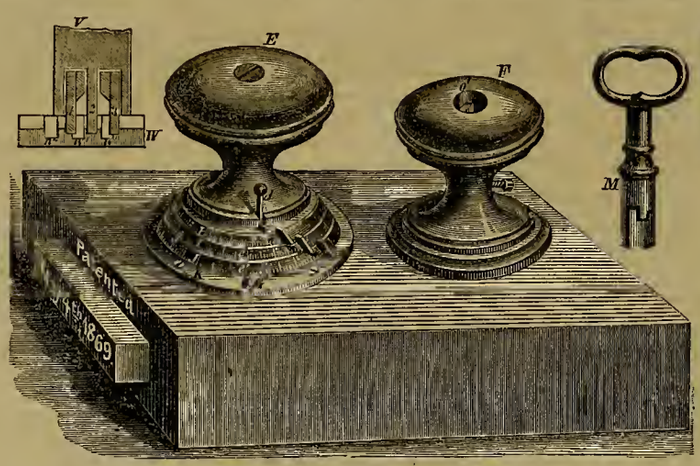

FIG. 1.—VORBE'S COMBINATION LOCK.

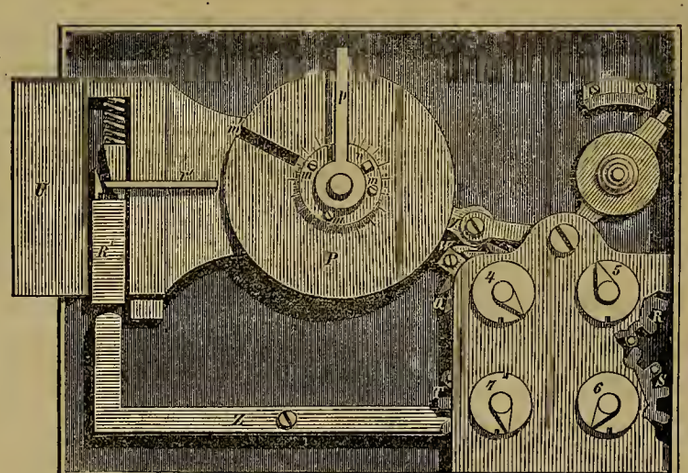

FIG. 2.—VORBE'S COMBINATION LOCK—Sectional View.

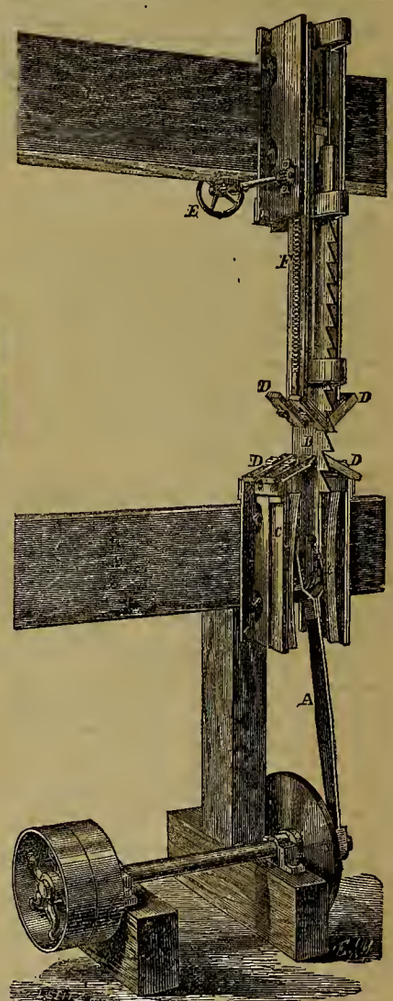
F is turned, and the bolt withdrawn, the plate *r*′ enters the line of slots in the tumblers. But if the combination be incorrectly made, the slots *m*′ will not all be in a proper line, and when the attempt is made to draw the bolt, the plate *r*′ strikes the edge of some one of the tumblers, and releases the stop R′ in the bolt U, which flies out, and makes it impossible to move the bolt (See Fig. 2.) It will then be necessary to pull down the little bolt *d* in the knob E, and turn the knob and the tumblers till the lug *n*, on the tumbler P, shall move the arm *p*, thus turning the arm W and the wheels Q, R, S, T, the last one, T, moving the lever Z, and pressing the stop R back into place. If a mistake be made a second time, the stop R′ cannot be again forced back till the toothed wheel T has been turned half around, which would necessitate about 50,000 turns of the knob E.

Action of the Muley Saw—Anderson's Hangings.

That a third more execution can be effected with at the same time a third less power, by the more method of hanging the saw in the old-fashioned mill, appears somewhat incredible at first glance, but not so after comprehending what mechanical principles are involved, and how the same have been regarded to the best working advantage by Mr. Anderson in his patent saw-hangings, below described. Concerning the justice of such a claim as the above, there is, at least, a large showing of very cordial and unqualified testimony; but persons interested may inform themselves to their better satisfaction, on that point, through the agents of the Anderson patents, Messrs. Fuller & Co., No. 109 Montgomery street.

The common saw, hung without reason's adjustments, works to a great disadvantage in choking during the upward motion, as appears evident on watching the manner in which it will throw up with it the dust. As much power is required for this non-executing, upward motion, as for the downward cut. All this wasted power is saved by the following ingenious yet very practicable method of throwing back the saw for every cut :

The pitman, A, is not connected, as in the ordinary method, directly to the saw, B, but the buckle which connects the saw takes hold of the wrist within the fork of



MULEY SAW—ANDERSON'S HANGINGS.

the upper end of pitman, A; the arms of the fork extending above the wrist to pivots working in the blocks that traverse the slides—thus making the pitman a lever having a long and short arm. This arrangement compels the lower end of saw to be vibrated back and forth, as the lower end of pitman describes a circle.

The "rake," or over-bang of the upper end of saw should always be in proportion to the feed carried, so that the saw will begin to cut the instant it begins to descend. In the ordinary upper muley, (when continuous feed is used) the sawyer is obliged to put in rake enough for his heaviest feed. Being unable to change the rake, except with a stoppage of their mill and a loss of time, it is seldom changed, and a larger log

Communications.

Written for the Mining and Scientific Press.

Account of Reveille and Adjoining Districts.

According to promise I will give you snch a description of this interior mining district, as my observetion, information, facts and figures will warrent.

Discovery—Water.

"Indian Jim" discovered this district in 1866. The principal ledge and first discovery in Hot Creek already bore his name. As Moses led the Israelites from the wilderness, so Indian Jim led the hankrupt miners and millmen of Anstin into this region of apparent mineral wealth. The district was organized October 2d, 1866. It is sitneted on the west side of Reilroed Velley, 110 miles south of Treesnre Hill. It is a dry, burnt, desolate-looking place. A little water can he had by digging—perhaps enongh can he concentrated in this menner to supply a 10-stamp mill. For milling nurposes, however, there is an abundence of water 12 miles distant, on the opposite side of Hot Creek Valley.

Alum.

As we approached the cemp from Twin Springs, the first ohject of interest that greeted our eyee was an alum hed or deposit—small knolls of vermillion-red color—separeted hy a small ravine. On the sides of the hanks, underneath the red cep or shell, the alum seems to form in flakes or crnsts, which drop down. In quality, it is from pnrest crystal to a dirty hrown eerthy color. In the little ravine is a hole ent a foot deep, which contains perfectly pure clear alum weter. Judging from the taste and "pucker" of the month it is es strong as a solution conld he made with cold water.

Fire Bricks or Red Adobes.

We found three persons making lsrge unburnt hricks ont of this red earth. They have the appeerance end herdness when dry of the ordinary fire hrick, except a little coarser for the want of proper grinding and preparation of materials, and being a little darker colored—abont ths color of a common hurnt brick. Mr. Nichols is using them in his asseying furnace, and they stand a white heat remarkahly well. As to what nse this red eerth and alum may be, we leave for others who are more cepahle of jndging to determine.

The Mines

Cover an area of about three by six miles —three mountains, known es North, South and Middle monntains, with depressions or sags between them. The manner in which they have been worked, would be a disgrace to their owners, if the circumstances under which they labored were not fully understood. The closing np, abandonment and removal of twelve out of thirteen mills of Austin, and in like proportion in other interior localities, constructed in times of excitement by nninteiligent and misdirected enterprise, disheartened capitalists from entering this remote field. The limestone formation of the district, agsinst which there has been great prejndice, until since White Pine has developed its wealth, increased the obstacles. The miners were poor while their mines were rich on the surfece. *They* had confidence in their permanent future productions. They have lived here "from hend to mouth." They *needed* rich ore to pay $100 per ton for hanling, and $45 for reducing at Austin, and yet to have a margin for supplies. They "gntted" their mines nnder the law of necessity, and have left npon them the worst possible face for the eye of capitelists.

There is almost every variety of silver mines in the district, from the two rich streaks of chloride to the broad and well-defined quartz ledges. While the prevailing formation is lime rock, there are vast dykee or croppings of quertzite, sometimes carrying in places more or less mineral, and in the neighhorhood of which are fonnd the best defined pay ledges. In other words, many of the mines show only pockets and streaks in the limestone, apparently without system or order, offering but little indncement or security for the investment of capitel, while others show larger streaks and deposits with like irregularity, yet sufficient in magnitude to fairly justify the expenditure of money to follow their varietions and trace them, if possible, into defined ledges. The third cless, however,—the large ledges of lower grade ore,—promises certain returns to those who shall invest their money. The "hig strikes" will prohahly he made among the "deposits," hut the surer fortune will come from the "hundred dollar rock."

The "Fisherman," the most notorions mine, on the northwest side of South Monntain, has heen badly worked and wears a had appearance. They cut into the ledge, scooped out ahont $15,000, and then run an incline straight away, down from the ledges, into solid limestone ehont thirty feet, then suspended work, leeving the ledge inclining upward from the top of the incline. There are large croppings at different points on the snpposed line of the ledge, to all appearances, as rich es where the first opening was mede. While it is probehle that there will he a vast amount of silver teken from this mine, still it rsquires money and *good mining* to determine whether it is rich surface deposit or e permanent trne fissnre vein. The surface rock will pay for regular and thorough development. But I prefer to rely upon statistics. A ton and a half crushed at Page's mill, Austin, worked at the rate of $1,632 per ton; five tons at the Oregon mill, worked $730 per ton; seventy tons in all averaged $400 per ton. One hundred and fifty tons on the dump worth $80 per ton.

The "Perk" mine on the Middle Mountain, is next in notoriety, and, like the "Fisherman," has been most slovenly worked, and finally left with hnt little or no pay ore in sight. Three lots of this ore shipped to Belmont, worked $780, $800 and $1,482 per ton. It must have more work done to give it apaying or business aspect. Whet has heen said as to the ineffiiciency or slovenly work in mining, applies to all the mines in the district. There is hardly one decent shaft, tnunel, or drift in the district, and yet there appears to be meny rich ledges which have heen a little opened.

"Indian Queen," a large well marked ledge two feet wide, worked $175 per ton. "Faxon end Elms," a parallel lode of same width, has about the same quality of rock.

The "Desert Queen" milled 7½ tons of ore at Anstin, peying $500 per ton. Twenty tons from "Davis" ledge, in different lots, worked from $240 to $362 per ton. "Anrora" worked three tons, paying $224 per ton. "High Bridge" worked fonr tons, paying $387.50 per ton.

Numerons lots from divers mines have been worked at Anstin, Hot Creek and Belmont within the last three years, ranging from $100 to $1,700 to the ton. There are 300 locations in the district, and there are probably fifty first class.

In a district where all are yet snbsisting on expectetions, it is a delicate matter to specify particular mines and their owners, in the midst of so many apparently rich, yet nndeveloped cleims. Each helieves he hes got his everlasting fortune in aheyance.

From statistics collected from Austin, Belmont and Hot Creek mills, and from the resident miners, and from the general appearance of the lodes of all sizes, one is impressed with the belief that the three Reveille Monntains ere almost febulously rich in mineral wealth.

The present holders who are too poor to develop, must let capital in on reesonable terms. The day bas gone by for prospectors to make a fortune by the sale of en undeveloped lode. From my intercourse with the holders of mines, I have no doubt but thet they will meke liberal arrangements with moneyed men, who may desire to enter the field. There is apparently no place on the continent where capital csn more safely make a moderate venture than in Reveille. A few thousand dollars judiciously and energetically expended on some one of the many largs well defined ledges, would soon determine the question as to the wealth and permanent future of Reveille.

The "Buckeye" mill of Messrs. Lambert, Meson & Co., is now on the road, end will he ready for the redncton of ores in a few weeks. It may be hoped that it will give an impetus to en opening of the mines and aid to demonstrate the necessity for the construction of a railroad from Elko to the Colorado. I repeat that holders hed better give away one-half of their mines to capitalists for development, or sell at low figures rather than to stay in camp living like bedgers and weiting for companies to pay a *great price*, and take *all the hazard of development beside.*

Milk Spring, Empire, Rattlesnake and Hot Creek districts are situated adjacent to and northweet of Reveille, and have the same general formation and much mineral wealth, all inviting capital and enterprise. Although I pessed through these districts I heve not time to speak of the several minee in detail; but all look hopeful for thefuture. Las Minas.

Familiar Science.

Retention of Water in Vegetables and Fruit.

As natnre places water in large quantities in vegetahles and fruits, she also tekes dne preceutions to keep it there. If we take from the earth nnripe potatoes or remove nnripe apples, pears, etc., from the stem; hoth wither, shrivel and become nnsightly to the eye, and vapid to the taste. These effects result from the porons condition of the nnripe skin, which permits the water to escape by evaporation. But if we allow the potato or fruit to remain until natnre has completed her work, no such result ensnes, beceuse, in the meantime, the porons covering of the skin has heen changed to a very thin, bnt impervions coeting, approaching in character to the nature of *cork*, and throngh which no appreciable qnentity of moisture can psss hy evaporation. The vegetahle or fruit is thus provided with a covering which enehlss it to "keep" throngh the winter. The keeping qnality of vegetehles and fruit depends mainly upon the degree of impermeehility of this outside covering. Atmospheric air, or rather the oxygen of the air, is the great corrosive or destructive agent which causes decomposition and decay of vegetahle tissus. If the covering of the fruit or vegetable allows its juices to escepe, the air will enter to take their place, and thus commence its work of destruction.

While the fruit continues in a healthy stete upon the twig, it is constantly passing off large quantities of water, which is taken np hy the roots of the tree, properly eliminated in the leaves, and a portion of the prepared fluid passed thence to the fruit, whence the nseless watery perticles escape to the etmosphere, leaving in the frnit only tbat which is needed to make up its bnlk. Hence the necessity for a porous skin while the fruit is maturing, end an impervious covering to protect it when taken from the tree.

Evaporation of Water from Vegetation.

Few are aware of the enormous quentities of water which are teken np through the roots into the orgenism of vegetebles, and pessed off thence into the atmosphere. An ordinary sun-flower is said to evsporete oneand a querter pints a dey, and a cabbage about the seme quentity. A single wheat plant is said to exhele about 1¼ ounces of water each 24 hours; at which rate en acre of wheat will draw end pess about ten tons of weter eech day! Some idea may he formed, from these statements, of the necessity for a plentifnl snpply of water to the roots of plants, to ensure a vigorons growth.

The sep of plents is the medinm throngh which the fluid is conveyed. It is also the medium through which the minerel constitnents are taken up from the soil and fertilizers employed, end distrihnted to the various tissues of theplsnt. This sep, in its progress from the roots to the leaves, end beck agein for its new supply of water and minerels, constitntes a delicate pnlp, in which the watery particles flow along with almost the rapidity of a stream of water over the earth. By the action of this sap, and the modifying and chemical infinences of the snn and air, varions properties may he communicated to the growing plant. These properties may be also more or less modified by the skill of man, as showu in our article in another column, on the "Artificiel Coloring of Plants." In that erticle we neglected to mention the fact timher, as well as flowers, may also be dyed various colors. A most notable instance of this is the black hamboo, of China. The Chinese possess the secret of coloring this plant a jet black. It is thus cultivated, however, only in the gerdens of the wealthy, and for ornamental purposee.

The strong food we eat creates a desire for muscular exertion.

Wasting Fuel.—The blue fleme observed et the chimney tops of our fonndries and other furnace stacks, is cansed hy the combustion of escaping gases, which will bnrn only when mixed with air, which is conveyed to them after they leave the mein hody of the furnace fire. These flames do not extend down the chimney, but commence and hurn only where they are sesn—in the open eir. Only a small part of the escsping gas is hurnt at ell; hut passes away through the fleme from the lack of the necessary degree of heat to light it. Such flames, as well as the thick volumes of smoke which often accompeny them, indicate a very greet waste of fnel—nearly all of which might be utilized hy a proper construction of the furnace. From ten to fifteen per cent., or more, of all the fuel employed on this coest for making steam is thus wasted, from the lack of either a little forethought or knowledge in the constrnction of furnaces and their flues.

Why csn we not count the posts on a fence when we ere riding rspidly along on a reil car? Because the light from the posts falls upon the eye in such rapid succession that time is not given ths one to produce a perception of its presence before its image is effaced hy the presence of another. Just es the string of a how vihretes after it hes been struck, so the vihretion of the retina continnes, and prodnces a perception of the presence of en object efter the presence of the ohject hes been withdrawn. The rapid presentation of objects so confuses or intermingles the vibrations that we lose their individuality.

Grubs in the Nose.—The snpposed "little gruhs or moths" which are eometimes pressed out of the nose, are simply little bodies of oil thet have been secreted hy the oil sacks which contain them, and, being retained in these secks hy their mouths heving heen kept closed by little specks of dirt or otherwise, have become hardened, and, when sqneezed ont, appeer like little white grubs. The remedy consists in keeping the skin in a healthy condition end the mouths of ths oil secs free from obstruction.

The Soil.—To the mejority of men the soil is nothing but dirt; but to the chemist who knows its origin, its nature and ite capabilities, it is a wonderful mixture of those beautiful elements which in their ever-verying forms become the ambient air, the liquid ocean, the precious opal, the amethyst, and the still more precious diamond; or delicete blue-bell and violet, the amerenth, the lily, and the rose-hud; the spear of blue grass and the cedar of Lehanon; or again, the ruby lip, ths love-lit eye, the noble pelpitating heart, end more wonderful brain. These are the jewels of which the soil is composed and out of which the hushandmen strives to force the food hunger craves. Henceforth as he turns the furrows of the field, let the sleep of his thoughts bs broken by the reflection that the earth thus turned np by the plowshere is donhtless composed in part of the ashes of encestral heroes, whose deeds are the history of the past, and whose mortal remains are the plastic materiel out of which we ars building the bodies of men to-day.

Inequalities of the Ocean Level.—A work lately puhlished at Camhridge, England, on the figure of the earth, gives, as a well established fact, that the water of the sea at the mouths of the Indus is elevated as much as 650 feet ahove that et Cape Comorin, the southern extremity of Hindostan. The author, Rev. George Pratt, Archdeacon of Celcutta, ascribes this difference of hight to the attrective influence of the Himelaya Mountains.

Yellow envelope paper, after being lighted and the fleme hlown out, will continne to burn until entirely consumed. White papers do not possess this property. Chemists allege that it is the coloring matter which renders this kind of paper more combustible than other qualities.

Remedy for Cold Feet.—Cotton socke next the skin, and woolen socks outside of them, are represented as a eure preventive of cold feet. At night the cotton socke will be quito dry and the ontside ones demp.

Mechanical Progress.

A New Form of Steel-Capped Rails.

J. L. Booth of Rochester, N. Y., some two years ago invented a method of giving iron rails a half-inch steel cap, which experienced railroad men think meets the requirements. The *Tribune* of June 3d says: "The rail consists of an iron base with a steel cap, united to the base not by bolts, screws, rivets or welding, but simply by clamping. The iron bar is rolled of the required form and weight, after which it is passed through the compressing machine, which clenches powerfully upon it the heavy steel cap. The subsequent action of weight upon it, as the passage over it of heavy trains, is to grip the iron more and more firmly, until the base and the cap become as firmly united as if they were a single piece of metal. Over the experimental rails laid down two years ago near the depot in Buffalo have passed 40,000 engines and 500,000 cars. The iron rails adjoining opposite them have, in the interval, been six times renewed. No change is as yet observable in the steel-capped rails, and to all appearance they bid fair to wear ont twenty successive sets of the ordinary sort.

Two of the rails were also laid on the N. Y. C. R. R., at Rochester, N. Y., June 7, 1867. On one, the cap was loose and even rattling; on the other, it was firm. They were laid continuously, and with the old style of chairs. They were placed where seventy engines and trains daily passed over them on the main line, and where the track was used constantly for switching and making up of trains. The rate of speed over them varies. The through freight trains are frequently joined at this point, three or four in one, to ascend an up grade. They pass over these rails often at the rate of twenty-five or thirty miles an hour. The loose-cap rail became tight in a very short time, and both are now in perfect order. Four sets of iron rails have been completely worn out, and new sets replaced, on the opposite side of the track, during the period of time these duplex rails have been down."

The effect of use upon this rail seems to be noticeably unlike that upon the rail with a *welded* steel cap. It will be remembered that with that, the rail and cap soon separated.

The *Iron Age* of June 17th notices this invention at considerable length, pronounces it undoubtedly a success, and says "there is reason to believe that it will be extensively adopted." It says also: "The force which holds the cap firmly upon its base is the process known by mechanics as "peaning," and may be illustrated by laying a straight bar of iron upon a curved surface, which will, by a successive application of light blows upon the upper surface, be thrown into a curved form. This is a well-known effect, and we venture to say, there is no force of power employed in, or applicable to, the springing of an iron bar more effective. It is this "peaning" process that splits down the sides of the T rails, and not the weight of machinery."

Artificial Stone—Oxalate of Lime.—At a recent meeting of the Polytechnic Association of the American Institute, Thomas Hodgson described two methods of preparing artificial stone, and exhibited specimens. One of these is prepared by treating lime with a solution of four ounces of oxalic acid in a gallon of water, thus producing an oxalate of lime, which is mixed with from two to four times its weight of sand. In this condition the material is a moist, friable powder. It is then molded to the required form in plaster of paris molds, removed from the latter, and suffered to dry. It is then preferably placed in a bath of dilute oxalic acid, which causes it to harden throughout, after which it is ready for use. In making the other variety, the inventor treats the oxalate of lime with a solution of silicate of potash, thus bringing it to a semi-fluid condition, whereupon it is poured into molds and suffered to indurate. The cost would be about ten or fifteen per cent. greater than that of common plaster casts.

In remarking upon this, Dr. Van der Weyde said that the idea was a lucky thought; for oxalate of lime is one of the most insoluble substances known.

Boiler Flues.—The transverse section of a flue should be a circle. Nevertheless, the longitudinal joints are generally lapped. Such a departure from the true circle, considerably lessens the power of resistance. The loss of strength has been ascertained to be nearly one-third. The joint should be a *butt* joint, with longitudinal covering plates. Mr. Henderson says the cylindrical form is the only one to be relied on in any construction where tubes have to sustain an external pressure.

New Steam Pump.—The London *Mining Journal* describes a pump lately brought forward, as of remarkable simplicity: "There are only two moving parts in the engine—a piston, with a cylindrical slide-valve within it, actuated directly by the steam, by the main piston passing over certain ports or openings in the steam cylinder, the valve moving in the opposite direction to that of the piston. The engine (with its steam piston and slide-valve, self-contained within the cylinder) is bolted upon the cover of the pump-barrel. The only moving part visible is about a couple of inches of piston-rod, which, of course, could be eased in if required. Were it not for seeing the piston-rod gliding backwards and forwards through the stuffing-boxes, no one would suppose the machine to be at work, its action is so noiseless. The engine has neither fly-wheel, crank-shaft, bearings, eccentrics, connecting-rod, pins, joints, tappets, springs, nor small valves to regulate the action of the steam. It can be worked at an extremely slow rate of speed, below ten strokes per minute, by simply regulating the admission of steam to the cylinder."

Tungsten Steel.—M. Leguen, who has been experimenting at intervals for two or three years, has lately, by the use of good white cast iron in place of the gray pig before used, produced tungsten steel of excellent quality. A portion of the iron is first alloyed with one-tenth wolfram, in a cupola furnace, and is added to the rest in the convertor. The conversion is carried further than usual, so that the carbon is reduced to one-half the ordinary proportion. The steel so produced is soft, but very tough, and tempers remarkably well. M. Leguen mentions that it will be found extremely useful for machines, some parts of which require to be tempered, while others are kept soft. The objection brought against this alloy is that it is expensive, but the amount of tungsten employed by M. Leguen is so small—only 0.55 per cent.—that it can make but a very small addition to the cost of the steel.—*Mechanics' Magazine.*

Area of Safety Valves.—The size of the orifice in safety valves may be determined by the following rule: Let the required area of the valve equal, in square inches, from 1-25th to 1-30th of the number of pounds of coal burned per hour. This rule is applicable to boilers in which the weight of water actually evaporated per pound of coal is about six pounds; consequently we may state it thus: the said area in square inches equals from 1-150th to 1-180th of the water actually evaporated per hour.—*Am. Artisan.*

Water-room and Steam-room.—According to Bourne, of the whole boiler-room, or internal capacity of the boiler, there are very nearly ⅓ water-room, and ⅔ steam-room; according to Robert Armstrong, there are ⅓ water-room and ⅔ steam-room; and that author considers that with a less proportion of steam-room, there is risk of priming, or carrying over liquid water from the boiler to the cylinder.—*Artisan.*

Scale in Boilers.—If the water contains bicarbonate of lime, this is decomposed by the heat and the carbonate is precipitated. Sal-ammoniac is recommended for preventing the precipitation of lime by forming soluble chloride of calcium. This is used in Holland for locomotives. Carbonate of soda is recommended as an effectual means of preventing scale from water containing either carbonate or sulphate of lime.

Nominal Horse-power of Boilers.—The following is a rule, founded on the best practice: Take a mean proportional between the area of fire-grate in square feet and the area of effective heating surface in square yards. The nominal horse-power of the boiler is generally much less than the indicated horse-power of the engine, to which it bears no fixed proportion.—*Am. Artisan.*

Scientific Progress.

Source of Light in Flame.

As proof that light in gas and candle flame is not due to incandescent particles of carbon, but to radiation from dense but transparent hydro-carbon vapors, Prof. Frankland showed that mixtures of hydrogen and carbonic oxide with oxygen emit but little light when they are burnt or exploded in free air, but exhibit intense luminosity when exploded in closed glass vessels, so as to prevent their expansion at the moment of combustion.

Again:—The denser the gas through which the electric spark is passed, the greater the amount of light emitted. The intensity of the light is very great in chlorine and sulphurous anhydride, and very slight in hydrogen. On passing a stream of induction sparks through the gas standing over liquefied sulphurous anhydride in a strong tube, at the ordinary temperature, when a pressure of about three atmospheres was exerted by the gas, a very brilliant light was obtained. A stream of induction sparks was passed through air confined in a glass tube connected with a condensing syringe, and the pressure of the air being then augmented to two or three atmospheres, a very marked increase in the luminosity of the sparks was observed, whilst on allowing the condensed air to escape, the same phenomena were observed in the reverse order.

Prof. F. closes his argument thus:—"The *necessity* of solid particles has been disproved. A closer examination into the evidence of their *existence* farther confirms our position. Soot from a gas-flame is not elementary carbon, it always contains hydrogen. The transparency of the luminous portion of flame tends to negative the idea of solid particles. The continuous spectrum of gas and candle-flames does not require the assumption of solid particles. The spectra of the flames of carbonic oxide in air, of carbonic disulphide, arsenic, and phosphorus in oxygen, are continuous, and so, as we have seen, is that of hydrogen burning in oxygen under a pressure of ten atmospheres. It is to the behavior of hydro-carbons under the influence of heat that we must look for the source of luminosity in a gas flame. These gradually lose hydrogen, whilst their carbon atoms coalesce to form compounds of greater complexity, and, consequently, of greater vapor density."

Dr. Winslow's New System.—C. F. Winslow, M. D., has published a book entitled "Force and Nature," which is said to be likely to attract a good deal of attention among speculative scientists. We have not yet seen it, and defer special mention to a future issue. Meanwhile we may mention that it takes the ground that *repulsion* "is just as much a force as attraction; cognate in origin, equal in value, quantity and extent with that of gravitation, and going hand in hand inseparably with it into atoms and into masses," and throughout infinite expansions into the dynamics of celestial motion; and playing an equal part also with attraction as a primary agent in the production of all physical, organic, and vital phenomena."

Liquefaction of Gases by Pressure.—This was exhibited by Mr. Ladd at the Royal Institution in the following manner: Three glass tubes, open at the bottom, containing cyanogen, sulphurous acid, and ammonia in their upper parts, and filled with mercury below, are inclosed in a strong glass cylinder filled with water. At the top of the cylinder is a small force-pump, which, when worked, drives more water into the cylinder, and forces the mercury, which acts as a piston, up the tubes. As the mercury rises the gases are condensed, and now appear as liquids at the top. When the pressure is reduced by opening a stop-cock the liquids boil, and the gases speedily resume their normal dimensions.

Ancient Human Remains in Pennsylvania and New York.

In the last issue of the Proceedings of the Natural History Society, W. H. Niles thus describes certain traces of an ancient race found in the Pennsylvania oil region: "Artificial excavations or oblong pits are to be found in considerable numbers in sections of the Oil Creek valley. Sometimes the sections thus marked embrace hundreds of acres in extent. The pits are from four by six to six by eight feet in size, and although much filled by natural accumulations, are frequently from four to six feet in depth. Some of the larger ones were curbed with timbers. The bark was removed, and it is stated that sometimes the timbers were halved and rudely adjusted at the corners. In one instance, while excavating preparatory to the construction of a sawmill, some workmen came upon one of these pits where the timbers were twelve feet in length, and placed perpendicularly upon end. It is also stated that in some of these wells there have been found logs with notches cut in them, which may have served as steps for the ascent and descent of those who constructed and used them.

Such works are not found beyond the limits of what is known as the oil region, and that they are excavated for the purpose of obtaining petroleum, there scarcely can be a doubt. That petroleum was obtained in evident from the fact that the timbers used are thoroughly impregnated with it, and by it preserved in a good state of soundness, and frequently are almost free from decay."

From the trees growing thereon, and other indications, Mr. Niles concludes that these works must be referred to the time of the ancient copper miners of the Lake Superior region, and of the mound-builders of the West.

The same report gives the conclusions arrived at by Mr. Henry McGuier, who noted the developments made in the cleaning out of the High Rock Spring, in Saratoga County, N. Y., in 1865. The different layers of muck and tufa overlying an ancient fireplace, with charcoal and other marks of the action of fire, must have required for their deposition,—Mr. McG. thinks,—some 5,500 years.

Chemical Action Arrested by Pressure. At a recent meeting of the Polytechnic Association of the American Institute, the above named subject was brought up. Mr. Phin,—after reading the statement, to which we have alluded in a former issue, to the effect that Cailletet has found that acids cease to disengage hydrogen in the presence of zinc, etc., if subjected to strong pressure,—remarked that in his opinion, M. Cailletet had deceived himself in the matter; that he had himself often prepared hydrogen by the action of acid on zinc under pressure of, say, ten atmospheres, and that others had done the same under much greater pressure. He added: "When operating in glass vessels we are apt to deceive ourselves from the fact that the pressure causes the bubbles of gas to diminish in size, and we are apt to suppose that no action is going on; when, in reality, gas is being produced at a very rapid rate."

State Geological Surveys.—The *U. S. Railroad and Mining Register* gives a memorandum of the present condition of the various State Surveys. Of Ohio, Michigan, Indiana, Illinois, Iowa, Missouri, Tennessee, North Carolina, New Hampshire, and New York, progress is noted; but the writer mournfully exclaims, "Alas for Pennsylvania! No cabinet; no survey; no record office; no mining bureau; nothing!"

What shall we say of California?

A New Arum.—Specimens have recently been forwarded to England, of a gigantic Nicaraguan plant, closely allied to the Arums, which has heretofore escaped the notice of traveling botanists. It produces but one leaf, nearly 14 feet in length, supported by a stalk 10 feet long. The stem of the flower is a foot in circumference, the spathe or flower is two feet long, purplish blue in color, with a powerful carrion-like odor.

Farming and Gardening.

Cultivation and Utilization of Oats.

Oats, as well as wheat and other cereals, were undoubtedly derived, originally, from wild grasses, and owe their present perfection solely to care and cultivation. They are much more recent in their introduction than wheat or barley. We find no mention of oats until about the commencement of the Christian Era; although we learn from Scripture that Solomon fed his horses on *barley*. Caligula fed his favorite horse on "gilded oats out of a golden cup," from which circumstance we may reasonably infer that the grain was then very scarce and dear; probably just coming into cultivation.

The advantages derived from the cultivation of oats, arise chiefly from the fact that they are more easily raised in cold and wet climates than any other grain; probably because, as the seeds approach maturity, they assume a pendant position, allowing the sporules of fungi, or the ovules of larvæ to be easily washed off by the rain, or shaken off by the wind. The scattered position of the seeds also allows of a more free access to the ripening and fructifying influence of sunlight and air. Oats when allowed to run wild rapidly deteriorate; or rather more readily fall back into their natural state than either wheat or barley.

The disadvantages attending the cultivation of this grain are due to the fact that the nutritive substance is generally less in a given weight, and to the acre, than in any other cereal, although the gross weight of seed may be larger. Moreover, the composition of oats is more liable to variations than other grains, so that the feeding value is not constant or reliable. Climate, soil, seed, manure, etc., appear to affect the character of oats more than other grains. Some kinds are fully one-third more nutritive than others.

The chemical and nutritive character of all the various grains have been much studied of late years; and from such examination it appears that none but the best quality of oats will bear a favorable comparison with the other grains. The oat, when properly selected and cultivated, is rich in non-nitrogenized substances, such as go to keep up animal heat and form fat, and in that respect it is valuable for fattening animals; but this condition is present in excess, only when the grain is of a superior quality. The proportion of nitrogenized or flesh-forming substances is also greatly dependent on cultivation; and in good oats is larger than in either wheat, barley, corn, rye or buckwheat.

The inference from the above is that oats should never be raised for grain feed, except when the utmost care can be taken in the entire cultivation of the plant. Hence greater advantages may be derived from "drilling in" oats, than other kinds of grain. Among the advantages of drilling we may mention the economizing in the quantity of seed; the giving of the grain more air and sunlight, and the covering of the seed more uniformly in depth. No grain is more dependent on cultivation than the oat.

We have said that oats, when properly cultivated, are superior for their flesh or muscle-forming properties—a very important consideration in working animals. The leaf and stem of this plant also contains a much larger portion of flesh-forming material than the same parts of any of the other cereals. It is to this fact that our California wild oats owe their superiority when used for hay.

Oats are also more improved in their nutritious qualities for animals, by grinding, than other grains; for the reason that they require more mastication. Horses, especially, when put to feed, after working hard, will not take time to masticate their food; hence this work should be partially done by machinery. Careful experiments show a saving of fully one-third from grinding. When grain goes into the stomach in a whole state, it is worse than lost, because not only no nourishment is derived from it; but it also works a positive injury to the system.

The varieties of oats now most commonly cultivated and approved in the Eastern States are the New Brunswick, a valuable white oat (newly introduced), the Surprise, noticed by us last week, the black Swedish, lately introduced through the Agricultural Bureau, and the Excelsior, a new English oat, remarkable for its plumpness and yield. All of these belong to the common oat species. Then we have the Tartarian varieties, such as the Potatoe, the Hungarian, and the Siberian. These are generally considered inferior to those first named. We have also the Naked oats, *Avena nuda*, and the Chinese, two recently introduced varieties, quite similar in character, and which are highly spoken of. In addition to those mentioned there are not less than seventy others, known to botanists.

With regard to the Norway oats to which allusion was made last week, we are in doubt. Our impression is that their popularity is more apparent than real, and is due to the extensive and persistent plan adopted for their advertisement to the public, rather than to their intrinsic merits. The result of some of the experiments made have been quite unsatisfactory, while in some cases excellent reports are returned. Some spurious seed has also no doubt been sold. It is possible that the diverse results may be due to certain peculiarities in this plant, which we will endeavor to notice next week.

Horticulture in Greenland.

In the furtherest northern limits of cultivation, as in Southern Greenland, Iceland, etc., there are barely two months of Summer during which what cultivation is carried on, must be conducted with the greatest care. Naturally, culture in those regions can produce neither fruits, seeds or trees; but vegetables, furnishing leaves only, do passably well. Radishes do well, so do cabbages, which, however, do not form heads, spinnach, salads, etc. The flavor, however, even of such growths, is quite inferior. Potatoes will only grow to the size of hazlenuts. Manure has very little effect upon the growth of vegetation; because the warmth of the sun is not sufficient or does not continue long enough to decompose it. The only way in which ordinary manures can be employed is to expose them to the action of the weather for several years, when they become sufficiently decomposed to be of some service in the garden. To produce even the vegetables named, seeds must be first started in hot houses. The ground, even in the most southern part of Greenland, continues frozen the year round to within a few inches of the surface. The utmost northern limit of trees passes through the southernmost part of Greenland, and on this coast just to the north of Behring's Straits. The thermal lines of Kodiak and our Alaskan peninsula correspond with those of the northern limits of Canada and New Brunswick. Still there is less ice along the coast of our northwestern promontories than on the coast of New England.

Large Tree Near Santa Cruz.—There is a redwood tree near Burk's Eureka mill, Santa Cruz County, that is 26 feet in diameter, 65 feet to the first limb, and is more than 200 feet high. It is a well-proportioned tree, round and not deformed.

A Stuffed Cat placed upon strawberry beds, is said to be an effectual means to drive away the birds. If so, why will not the same device keep the birds from cherry trees. The experiment might be easily tried.

Artificial Coloring of Plants.

Plants derive the whole of their mineral matter from the soil, as well as an important portion of that which is combustible (their carbon). The water which moistens the soil, takes into solution these mineral matters, and from the rootlets, where it is first received, passes it up through the trunk and stem into the leaves, (the lungs of the plant) where it is further elaborated by the action of the sun and air.

This part of the process is a chemical work, and to it is due the color of the plant. There can be no color, but white, without the aid of the sun or some artificial light. Different chemicals may be made to produce, by the aid of the sun, different colors. Charcoal powder darkens and enriches the flowers of the dahlia, the rose, the petunia, etc. Carbonate of soda reddens the hyacinth, and super-phosphate of soda alters in various ways the hues of other plants.

Some few years since, one of the hands employed in the paint factory of Mayor Tieman, at Manhattanville, N. Y., having thrown some liquid green paint of a particular kind on a flower-bed occupied by white anemones, the flowers subsequently made their appearance with petals as green as grass. The paint had in it a peculiar and very penetrating chemical mixture, which Mr. Tiemau has since applied, with other colors, to various plants, annual, biennial, and of the shrub kind—the result being invariably that the flowers so watered took the hue of the liquid deposited at their roots.

The circumstance which originally led to the discovery of this interesting class of facts was due to the experiment of an English horticulturist who once covered with pulverized charcoal the ground around the roots of a rose bush, the flowers of which were of a faded and uninviting hue. He was surprised to see the color of the flowers, as they successively came out, gradually change to a lively rose color. He tried the same upon his petunias, and the white colored flowers become beautifully veined with violet tints; while violets to which he applied the charcoal, become covered with irregular spots of a bluish or almost black tint. It is a singular fact, however, or at least it has been stated as such, that yellow flowers appear to be insensible to the action of charcoal.

It is thus that science and observation has enabled the horticulturist to control, to a greater or less extent, the color and character of the most beautiful productions of nature. As the dyer prepares the chemical ingredients into which he dips his stuffs, to give them the desired color, so the horticulturist may now place about the roots of his favorite plants the peculiar chemical, so prepared and mixed, as to produce the new color which he desires should be imparted to its leaves and petals. Thus it appears that we may yet be able to "paint the lily," which Solomon, in all his glory, considered entirely beyond the power of man. The wonders of science, great and varied as they have already become, are as yet but just beginning to dawn upon us.

Something New for Greens.—The *Alta* says that an English gardener, fond of pumpkins, tried some of the young, just-formed fruit for greens, and found it excellent. He cuts the tender shoots and cooks them with pepper, salt and butter, chops them up fine, and serves like other greens. They are commended to epicures for their brilliant color, delicate aroma and grateful flavor. Our cotemporary suggests that some one should try this new candidate for table honors and report thereon.

Crystalizing Flowers.—This is done by suspending or repeatedly dipping them in water saturated with alum. This, however, can only be done with dried specimens. The freshness and beauty of flowers can be preserved by dipping them in glycerine.

Fire in the Grain Fields.—The Castroville *Argus*, of June 26th, says that on the Thursday previous a destructive fire broke out in the grain field on El Alisal Rancho, about two from miles from Natividad, by which some 300 acres were burned over and 100 sacks of thrashed grain spoiled. The fire originated from sparks that fell from the chimney of a steam thresher.

The editor of the *Argus* expresses the hope that some plan will be found by which the falling of sparks in grain fields may be avoided, so that our farmers may to the fullest extent reap the reward of their faithful toil. We would refer the *Argus* to the notice of Mr. Bowker's "Improved Locomotive Smoke Stack," which will be found under the head of "New Inventions" for the present week.

Deformed Cattle—Interesting Physiological Fact.—The Walla Walla (W.T.) *Statesman* says: The people in the vicinity of Spaulding's, on the Touchet, are having something new in the annals of stock raising. A farmer from that section informs us that fifteen out of twenty of the calves born there this spring have either been so badly deformed that they died at birth, or it was necessary to kill them to put them out of misery. In one instance there was only one perfectly formed calf out of thirteen, and in another only one out of six. The farmers there believe they have discovered the cause of this singular freak of nature in the fact that only cows that range in the vicinity of, and licked at, certain banks, supposed to be impregnated with alum, have deformed calves. The residents there are preparing to fence these banks, or licks, and thus in future avoid the misfortune that has befallen them this season.

Who Owns the Fruit of Overhanging Limbs.—Judicial decisions have established the principle that if a tree growing upon the ground of one party overhangs that of another, the party owning the tree can enter upon the ground of his neighbor and gather his fruit, provided he does no damage beyond that necessary for such an act. On the other hand, the neighbor has the right to cut off all the limbs that overhang his land, and remove all roots that permeate his soil; but although he may permit them to grow, he has no right to enjoy the benefit of their fruit.

Four O'clocks.—Mr. Williams, of the firm of Williams & Ede, of this city, sends us word that he has planted some Eastern seeds of this flowering plant, and finds to his surprise that in California soil it forms bulbous roots, and becomes perennial. Some members of this family in the tropics often become shrubs or trees; but we were not aware that they ever formed bulbous roots.

Bovine Hybrid.—W. H. Kelly, a Big River merchant, has a cow that has given birth to an elk calf. He obtained the cow from a hunter in that vicinity. Several persons have seen the funny stranger, and report it elkish in manner but calfish in taste.

Wheat and Phosphorus.—When a wheat crop of 25 bushels is harvested from an acre, there are removed 20 pounds of phosphoric acid and 30 pounds of potash. If these are not restored by some form of manure, the field will not continue to produce 25 bushels to the acre.

The Saving of Machinery.—It is said that the threshing machines used in the United States save 10,000,000 bushels of grain annually more than the flail would save.

Scarcity of Harvest Hands.—It is said that there is a scarcity of harvest hands in some localities. In the vicinity of "Hayward's" farmers have been forced, against their wishes, to employ Chinamen, as without them, they would lose their crops.

Sitka cranberries have made their appearance in this market—100 barrels having arrived last week. The fruit is very fine, much better than the Oregon berry. It is said that any quantity can be obtained from Kodiac.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, July 3, 1869.

Financial.

Although our local money market remains stringent, there are strong indications of an early release from the pressure. In the Savings and Loan institutions the deposits exceed the withdrawals, indicating a less active demand for cash, and a wholesome thrift. However severe may have been the ordeal from which we are just emerging, it has been literally nothing compared to that suffered by New York when as high as 50 per cent. per annum was paid for money, nor are their difficulties yet surmounted. Treasure shipments to a large extent are now made by railroad instead of steamer to New York, the rate being 1¼ per cent., insurance included.

The real estate transactions for the past six months of 1869 have been largely in excess of those for the year preceding. *Carter's Real Estate Circular* has the following figures for the first six months of the past four years: Number of sales so far for the current year, 4,615; value, $21,001,674. Number same time last year, 3,477; value, $13,830,436. Number in 1867, 2,895; value, $8,985,019. Number in 1866, 2,590; value, $7,634,759. While the value of the sales for 1867 only increased $1,350,260, the increase of 1869 over 1868 amounts to $7,171,238. The mortgages for June numbered 293, valued at $1,305,942, and the releases were 139, valued at $419,795.

The Exports of Treasure from June 1st to date, have been as follows:

Total since June 1st, 1869	$3,654,224 02
Previously this year	15,950 193 98
Overland since May 8—to New York	1,421,811 95
Total since January 1st, 1869	$21,046,229 95
Corresponding period, 1868	19,937,491 65
Increase this year	$1,108,738 30

City Stocks.

During the past week the open market for miscellaneous shares has not been active. We note sales of Spring Valley Water stock at $64 50 per share. Of San Francisco Gas stock, 130 shares realized $80 25 per share. The usual monthly dividend of this Company is payable since the 1st inst.——The July dividend of the Pacific Bank is announced.——The stockholders of the San Francisco Insurance Company will receive a portion of the assets of said Company, on and after the 1st inst.—— The July dividend of the North Beach and Mission Railroad is now payable.——The Merchants' Mutual Marine Insurance Company, and the Spring Valley Water Company, disburse their usual dividends on the 10th.

Mining Share Market.

The mining share market has been tolerably active during the period under review, and the stock list of the Board participated quite generally. Prices have been well maintained, though we do not note any very material advance or decline. Larger sales than usual have been made of White Pine stocks, a dozen companies comprising the sale list.

The Board adjourned from Friday afternoon, July 2d, to Wednesday morning, July 7th—allowing all a general holiday.

IMPERIAL—is in light request. From the annual report for the fiscal year ending May 31, 1869, we make the following extracts. With regard to the operations in the Imperial-Empire shaft, the Superintendent says:

In August last, sinking was resumed in the Imperial-Empire shaft, and in January of the present year the shaft had attained a depth of 1,100 feet, since which time stations have been opened on the 1,000 and 1,100 levels. On the 1,000 level a drift was run to the vein, e distance of 90 feet, where the vein was found to contain only barren quartz. This drift has been continued west into the vein 75 feet, without any better result; also, a side drift hae been run north 60 feet, from which point a cross-cut has been run east 60 feet to the clay-wall—which cross-cut did uot develop anything but barren quartz. On the 1,100 level, we fonnd the east wall at a distance of 15 feet from the shaft. A drift on this level has been run 150 feet west into the vein, which contains only porphyry. On this level we are running a drift south to the Holmes mine, a distance of 248 feet from this shaft. This drift le now 76 feet south of shaft. The summary of work done in this mine for the year past, has been the sinking of 225 feet of shaft, and the running of 760 lineal feet of drifts.

From the Secretary's report we take the following recapitulation of the receipts aud disbursements from May 31, 1866, to May 31, 1869:

RECEIPTS.

For Alta mine		$993,032 52
" Holmes mine	25,775 07	
" Rock Point mill	10,101 94	
" Gold Hill mill	3,183 58

From the Alta mine 42,958 tons of ore were reduced, aggregating $576,371 or an average of $13 37 per ton; and from the Holmes mine 2,214 tons, amounting to $26,775, equal to $11 64 per ton. The cost of reducing 12,333 tons of ore at the Gold Hill mill amounted to $7 84 per ton, and 32,839 tons at the Rock Point mill, $7 60⅔ per ton. The expenses of hauling ore from the mine are included in the above. The cost of extracting 40,975 tons, including drifting, repairs, etc., amounted to $4 78⅓ per tou.

The following is a statement ebowing the disbursements and receipts of the Company, from the date of its going into operation to May 31, 1869:

DISBURSEMENTS.

For expenditures for milling and mining purposes, including new machinery and improvements		$3,813,773 27
General expense account, for sundries and legal expenses		288,031 11
Assaying		37,558 72
Expenses in San Francisco		59,097 51
Interest		19,237 73
Premium and discount		29,017 81
Treasure freight		30,230 67

RECEIPTS.

Mines and Mills—		
Receipts from ores and sundries sold for account of mines and mills		$5,119,374 72
Interest and rents		2,768 79
By proceeds from outside ores		48,828 60
San Francisco office		800 00
General expense		1,309 73
Property sold		1,343 75
Premium and discount		33,829 47
Federal tax, returned by Assayer		406 26
Gold Hill Draining Company		2,284 43
Assessments		150,000 00
Imperial engine shaft		5,058 28
		$5,365,704 03

The available assets of the Company, in supplies, consist of timber, lagging, wood, castings, quicksilver, chemicals, etc., and for account as follows:

Gold Hill mill	$3,398 80
Alta mine	1,584 88
Rock Point mill	5,904 04
Imperial-Empire shaft	1,724 81
	$12,612 53

The only outstanding liability of this Company is $27,000, being balance of subscrtption ($30,000) to Virginia and Truckee Railroad, payable in equal monthly installments of $3,000.

The officers for the ensuing year are as follows: A. K. P. Harmon, (President) Thomas Bell, (Vice-President) Thomas Sunderland, A. Hayward, James Freeborn, Robert Sherwood and Joseph Barron. D. A. Jennings was appointed Secretary.

HALE & NORCROSS—exhibited aheut the usual activity, showing better prices at the close. On the 29th of June, $25,686 in hullion eamo to hand. During the week ending June 29th, the upper mine yielded 121⅔, and the lower mine yielded 1,269 tons of ore, 709⅓ tons coming from the fifth station level. In the same time, 1,166⅔ tons were delivered for reduction, leaving 1,505 tons on hand.

CHOLLAR-POTOSI—is in better request, at improved rates. The week ending June 25th shows an ore yield of 1,830 tons, from the following localities: Blue Wing, 830; New Tuunel, 810, and Croppings, 190 tons. The general condition of this mine is very good. On the 21st ult. they connected the 1,100 station with the Hale & Norcross 1,030 level, giving a fine draught of air for working purposes. At the 500 station the face of the drift is in clay and porphyry, with a gradual increase of water. On June 30th, $18,116 in hullion came to hand.

GOULD & CURRY—obtained slightly improved prices over last week's sales. On the 29th of June, $14,329 in hullion was received at the office in this city, and for the month of June the aggregate product foots up $46,295 69. During the week ending June 28th, 325 tons of ore were extracted, the everage assays of car samples showing $63 10 to the ton. Tho shaft has been completed, and work commenced in opening the seventh level.——OPHIR, under moderate sales, shows a decline. The drift, on the 29th ult., was 397 feet in length.——Notbing new from the IMPERIAL; sales light. The office is removed to 419 California street.

Of prominent White Pine stocks dealt in hy the Board, the *News* of the 26th ult. bae the following:

AURORA CONSOLIDATED—is looking remarkably well throughont. The south shaft is 55 feet deep, and in a large body of high-grado ore. At a depth of 30 feet a hreest is being pushed south in good ore. This is below the north hreest from the samo shaft, which has been penetrated 20 feet. The drift northerly from the Iceberg shaft still progresses, and is now in 90 feet. The shipmente of ore continue at ebout 20 tons dally, hut the 250-ton pile of ore on the dump still increases in size. The drift from the Iceberg to Last Chance shaft has heeu enlarged, and as soon as milling facilities can he had equal to the yield of the mine, cross-cutting will he commenced from this drift to the southeest, and the ore taken to hoth shafts for hoisting.

HIDDEN TREASURE (Original) has sent to mill about 118 tons of ore during the week, or ahout 17 tons per day, and is taking out 60 tons per day of good milling ore. The tunnel is in 98 feet; 150 feet (or 52 feet more) will strike the ledge at a depth of 200 feet from the surface near the south end of the claim. The west wall has been reached by the cut, and the entire ledge is beiug breasted to the southeast. Work is being prosecuted along the ledge from one end of the claim to the other, and au ore breast has been commeneed 150 feet north of the south line, to which point it will he pushed.

NOONDAY—has a drift south 200 feet, with a cross-cut 100 feet in, running 40 feet east and 15 feet west. Twenty feet in the main drift a winze has been sunk 62 feet, from the hottom of which a drift has heen run 20 feet through quertz. The north shaft is down 30, with a south drift of 18 feet. Ahout 36 tone of good ore on the dump.

VIRGINIA.—The mein shaft is down 30 feet, and 8 more will connect it with the tunnel. The hottom of the shaft ie in very rieh ore. All tho work about the mine is progressing favorably. Ten tons of ore were seut to the Centenary mill on Thureday last, and more ie heing assorted. On Saturday last an assessment of $1 25 per share was levied on the capital stock, which will become delinquent July 26th.

COALS TO NEWCASTLE.—The Santa Barbara *Post* says that not less than three million feet of lumber have been imported into Santa Barbara county within the two years past; and this while immense forests of the finest timber in the State may be found in the Santa Ynes Mountains, which run through the central portion of the county, within eighteen miles of the town of Santa Barbara, where the lumber is landed for the northern coast. Where are our saw-mill men? The *Post* says there is a fine opening for somebody in that line.

LATER FROM THE AVITOR.—Before going to press, we learn of another trial of thie new aerial vessel at the "Aviter Works," on the San José Railroad. Report saye that it rose proudly into the air, "sailed around" the rural burg with fine effect, and then settled down again like a new fledgling, still ambitious for further assays. This was only a working model, 28 feet long, 8 feet average diameter, cubic contents 1,360 feet and weight 82 pounds; gae 78 pounds. Man has eo nearly mastered this problem of aerial navigation that there prevails a very general faith in the final success of some machine of the kind. Further particulars will be obtainod, if poesible, of the next voyage.

CALIFORNIA SALMON AT THE EAST.—An extensive fish dealer at Sacramento has received an order from St. Louis for regular supplies of California salmon, to be sent by the Pacific Railroad. He immediately shipped a lot done up in ice. This is a new and unexpected development growing out of the completion of the overland railroad, and may possibly lead to important results. The Pacific Coast can supply the world with salmon.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

MERRIMAC.—*Miner*, June 19th: This claim is likely eoon to be etarted. Eestern owners have writteu to have a thorough investigation, with a report as to prospects.

MORNING STAR.—Work is now on drift number 8 in the lower level.

PENNSYLVANIA.—Of the product from the ton of ore recently taken to Washoe we can yet learn nothing.

OWNERS COMING.—We heer of several large owners of mining intereets in this cnunty residing East who are coming here soon to eee for themselves how the land liee. This is the only proper way.

ITEMS.—The two long tunnels at Bullion are going ahead....The emelgamating room of the M. C. mill is going np with elecrity. ....Another change has taken place in the Globe tunnel, and the rock works better. ....The Plecerville corporation has manifested a sign of life in writing here to know the amount of taxes due on its mine.

COMING BACK.—*Chronicle*, June 19th: N. Graff, formerly Snpt. of the Tarshish mine, but at present Snpt. of a silver mine at Sen Mercial, Sonora, Mexico, is coming back, and will probably take cherge again of the Tarshish.

CALAVERAS COUNTY.

UNION SHAFT.—*Chronicle*, June 26th: The baling from the old Union shaft continues without abatement—even of the weter. There are some eight feet still iu the mine. Champion, Peters & Ahnert, the proprietors, will prove successful, or "go through" in the undertaking.

PALOMO.—Letter to seme from San Andrees: The new hoisting works end batteries are perfection. They have a new style of shaking table invented by Mr. Brief, the foreman, who, I believe, has applied for a patent. It is on rollers, instead of being suspended from freme-work; and is moved by a crank, without any side motion. I am informed that the quartz mining intereets at Angels Camp are prosperous, the mills all being in active operetion end doing well. At the Big Mill mine they have struck it rich—rock that will pay over $1,000 per ton—that is, they have 15 inches in width thet will pay that amount, while the balance paye from $10 to $20.

LOS ANCELES COUNTY.

SOLEDAD.—*Star*, June 19th: Messre. J. A. Hayward & Co., bankers, received this week 50 ozs. gold from the Eureka Miuing Co., Soledad, being the result of a nine daye' run. The weter is becoming very low, and operations will have to proceed hereafter slowly.

MARIPOSA COUNTY.

The *Gazette* of the 25th says that rock from the Mariposa Co'e vein in that towu, ie being proepected at the Benton mills by the dry plen. If thet plen seems best enited for the rock, the Mariposa mill will be recoustructed.

NEVADA COUNTY.

NORTH BLOOMFIELD.—*Transcript*, 23d: The Gravel Mining Co. have shut down in their cleims, and are working with ell energy to complete their ditch from Little to Big Cañon Creek. The line of the ditch is over rough grouud and will require a large amnunt of fluming and blesting.

SNOW POINT.—Same of 25th: The prospect at this old camp is first-rate. The Weter Co. has a mine regarded as one of the best on that ridge. The company has been stripping all eummer and running from 600 to 800 in. of water. McCarrow & Co. are drifting in the old Golconda cleims, and at their last clean up took out some gold which very much resembles that on the opposite ridge, at Minnesota, in Sierra County. These claims were abaudoned for many yeare, until this season. Cowger & Co. are runniug a drifting tunnel, and have excellent indicatious. Price and his men are still at work, as they have been for many yeare.

MOORE'S FLAT.—The Eagle Co. have commenced sluicing through their new tunnel, and are running for the rich channel worked by Hickey several years ago. ....The Illiuois Co's claims and Hickey's have been worked steadily and are paying well....The old St. Lewrence ie owned and worked by Chinamen....Atwater & Knotwell have got their pipe dowu and ready to run water to their claims.

WOOLSEY'S FLAT.—We learn that the town never looked as prosperous ae at preeent. The XIX Co., owned by Marks & Co., are doing spleudidly, and give employment to a good many men. Last week they cleaned np $11,000, and tbe prospect ie that their next will be larger.

Shultz & Stober are working with energy, and it is paying them well.

Reed & Mills are working tbe Blue Bank claims. They heve been drifting for years, and everybody knows they are doing well.

RELIEF HILL.—Same of 26th: For several years companies prospecting for the gravel channel, now have fair promise of succese. The North Star ground is worked by the Eureka Lake Co., and they are doing well. The Wakashore Co. employe 12 men, now drifting, and the claim hes been for some time averaging $12 per day to the man. This company has etruck the chennel, and is in 200 ft. further than eny other. The Eagle claims heve 100 ft. fell, and are within 60 or 80 ft. of the pay channel. They will commence washing this fell and run their tunnel up to the bank. Reasoner & Bro. are obtaining favorable results. When the Eagle Co. strike the dirt, other claims will be eterted, and there is every prospect that Relief Hill will become a lively cemp.

THE MANZANITA CLAIMS.—Seme of 29th: Marselus & Meltman have started a new tuunel, and ere siuking a ehaft on a line with the tnnnel, in order to get a new face in the bank for washing. The tunnel is to be run on a 5-inch gredo. It will be 1,300 or 1,400 ft. long, end will eneble the company to work 38 ft. deeper than at present.

JONES' BAR.—oonsidereble mining is being done in the vicinity of Jones' Bar this season. Several companies are prepering for washing, and will commence as soon as the river gets low enough.

MINING AFFAIRS.—Gress Vallcy *Union*, 25th: There was a rumor a few deys since that the Miners' Union has backed dnwn from its position of hostility to the giant powder, and would now go entirely ageinst Chinese labor in the mines. The rumor was false and the strikers remain firm as ever against the gient. As to Chiuese labor, no one has proposed to introduce that into the mines, and hence there is no truth in the reputed new position of the minere. The Superintendents of the idle mines, Empire and North Star, are in San Freuoisco, and we understand they are determining upon some method of going to work et an early day. It is probable thet iu the first part of next week, we shall know what is to be done with the mines. At the Eureke and the Idaho, matters move on in the old quiet way, and both mines will surely pay their regular dividends at the first of next month.

EMPIRE MINE.—Yesterdey morning the Empire Miniug Co's mill started up to crush the rock which had been heretofore taken out. There are betweeu 200 and 300 tons of rock in frout of the batteries. Soou after the whistle souuded a number of men, willing to work any way the proprietor wanted them to do, applied for employmeut, and Capt. Lee concluded to try once more to fill the miue. Yesterday afternoon, at 4 o'clock, about 30 men had been employed, and there was every prospect that the full number wanted could be obtained by to-day. If, however, the Empire can not be filled with men willing to work as the company want work done, the mine will be closed down indefinitely.

VICTORY MINE.—Grass Valley *National*, 25th: This mine, on Massachusetts Hill, has been worked during the summer, for eight years, the weter having occasioned intermissions. A shaft hes been sunk to the depth of 20 ft., and a drift run 300 ft. on the ledge. The mine has been thoroughly prospected and they have a well-defined ledge. Considerable rock has been taken out, which has averaged $14 to the ton. A whim has been erected for hoisting, and it is the inteution of the owners to put up steam mechinery soon. The mine is owned and worked by James McCann and others.

PLACER COUNTY.

DAMASCUS. — Correspondence of *Stars and Stripes*, 24th: "Last week the Mountain Gate Co. got through with their tunnel and raised their ehaft to gravel. This is the most extensive tunnel in Placer County, being over 3,000 feet in length, and has taken much money and many years' labor. It taps a claim of great extent.

Robert Lewis has got a splendid prospect in the Mill claim, and it is likely to prove one of the best in Placer County. Charley Cook has made a clean up and harvested a splendid lot of gold. Billy Cameron is doing pretty well in the Big Gun claim, and times are quite lively."

TRINITY COUNTY.

NEW RIVER.—*Journal*, 26th: The Portuguese Co. have begun cleaning up, and have taken out already about $4,000, with considerable washing up to do yet. John Keach cleaned up with good pay. There are 30 miles of New river offering first-rate inducements tn miners who would prospect and work as they do in other localities.

LEWISTON.—We understand that two or three companies intend going into the river. There is every reeson to believe that the Trinity will be lower this summer than ever.

MINERSVILLE.—P. Van Matre brought $858 of fine-looking gold dust to Weaverville, recently picked up on Little Mule creek, during three weeks' piping. The gold is coarse, one piece weighing four ounces. It was from the Wheedon claim.

LOWER TRINITY.—McCallum & Clifford have first-rate prospects on French creek, a stream emptying into Trinity river at the heed of Taylor's Flet. Gratifying results have been obtained by other partiee in Sawmill creek.

JUNCTION CITY.—A correspondent writes: Most of the miners are cleaning up, and money is beginning to be plenty. As none of the claims have finished yet, I cannot give you the amount of the gold yield. Joseph McGillivray is now in San Francisco, purchasing iron-pipe to plece across Trinity river to carry water from his Cañon creek ditch to claims on the flat and bar opposite. The flat on this sids of Cañon creek is eaid to prospect big, and, could water be had, would pay immensely. Mac seys if any number of miners will pnt up $1,200, subject to his order when the work is completed that he will bring water on the ground for them, and give them their money's worth in water.

YUBA COUNTY.

A RICH MINE.—*Appeal*, 24th: A gentleman from the upper country, in Camptonville last week, saw the proceeds of the Eureka mill for ten days' run with five stamps, crushing only day times, 600 ounces of gold, valued at $10,000. He was informed thet their clean np was $6,000 from five days' washing. While at work they took out one specimen valued at over $1,500. The owners are citizens of Camptonville.

Arizona.

RICH DISCOVERY.—Visalia *Delta*, June 23d: Messrs. Moss, McGuire end Belcher returned last week, from a two month's cruise between White Pine and the Colorado. They have made some of the richest discoveries made on the coast—their ore running from one hundred up into the thousands—and ledges from three to thirty feet in width, with an abundance of wood, weter and grass; within a very few milee ere immense forests of yellow pine. They will etart out egain in a day or two with full eqnipments and eupplies.

NORTHERN ARIZONA.—It is reported that Gov. Sanford and Capt. Mexwell, have organized a party and equipped, for the purpose of exploring the Apache country in search of plecer mines. Each man furnishes his own outfit end all share in the proceeds of the adventure. They expect to leave Fort Yuma in July.

Colorado.

AWANDA LODE.—Georgetown *Miner*, June 17th: Pearson & Fellows, after several months' hard lebor, struck, on Tuesday, 20 inches of eulphurets of eilver and galena. The ehaft is now 20 feet deep, the crevice five feet, between solid walls.

ITEMS.—They have struck a 12-inch vein of first-class mineral in the east drift on the Lilly lode, on Brown Mountain.....A. Johnson is obtaining very rich ore from the Major Anderson lode, Griffith Mountain.....Work on the crushing end dressing works is progressing rapidly.....Stewart's reduction works were flooded by high water on Monday night, and he was forced to shut down.

EQUATOR.—Ninety-three tons of second-clase Equator ore, worked by Huepeden & Co., yielded per ton in ounces saved 115.8. Per ton in coin $149.72.

TOPEKA.—Ceutral City *Herald*, June 9th: Wylie & Hurst have commenced work on the Topeka lode, Bates' Hill. A shaft 75 feet was sunk some years ago, and good ore reached, but not rich enough to pay at the price of labor then ruling. It will pay very well now.

ITEMS.—The dams on all the claims on South Clear Creek have been washed away. Some of the miners were taking out pay and fought against the water for a long time, but they were not able to withstand it. The creek is very high and still rising. ....A new lode has been found in Mountain House district, which, at a depth of 18 feet, shows a crevice of four feet, with ore one foot wide.....John Sensenderfer has got his 20-stamp mill under way. It will be kept bnsy during the summer.....Cameron & Moore have found a new lode in Cascade district, Clear Creek County. At a depth of nine feet it showe a crevice of eight feet, with a vein of ore one foot wide. A select epecimen assayed by Prof. Burlingame, contained silver at the rate of $1,716.26 in coin to the ton. The owners refueed $12,000 for one-half of it.....Samo of 12th: The new discovery near Dory's Ranch is called the Ruby lode. Ore from it contained $1,071.20 coin per ton..... Same of 16th: Mr. Andrews, of Nevada, brought down to-day 105 ouncee, the result of one week's run on ore from Phillips & Burns' claim on the Jones lode. The ore yields 30 ounces, or $630 per cord, in a stemp mill.

CLEAR CREEK.—The Weshington are putting machinery into their mill. A new pocket has been found in the Brown mine. The furnaces are in full blast. The Baker mine is looking better than ever. A rich deposit of ore has been found. The mill will be ready in ten days. Bruckner's patent eylnder will be put up in a short time. Stewart is running on Equator ore. The Wilson & Cass Co's mill will be the finest in the county.

GILPIN COUNTY.—Population is larger than ever before eince 1862. If it continuee to increase es during the past moutb, our monthly product of gold will reach $300,000. Many valuable mines, whicb for years have been deserted, will be worked.

ITEMS.—Central City *Register*, 17th: Three and a half cords of ore from the Jones lode yielded five ounces gold bullion, worth over $2,200.....The Black Hawk produced last week from 28 corde of ore, 170 ounces of gold bullion. The Bobtail Co. produced 92 ounces.....Our daily shipment of bullion has been kept up to the averege of $10,000 thus fer this month. ....An assay by Von Schulz, of ore from the Coaley lode, gave 22,379.94-100 ozs., —or $29,094.92 coin value per ton of 2,000 pounds.....Van Camp has struck another big pocket in the Creighton lode.....An aesay ycsterday of ore from the Kremlin, Cascade district, gave a yield of 283 ozs. silver per ton.

IDAHO—TRAIL CREEK.—The Bennett Co. have got their mill nearly completed. Chavenne & Cramer are putting up an arastra for reducing surface rock from the Coyote. Judge Colviu has the walls of his fine stone mill nearly completed. He also has men at work putting the shaft in condition for takiug out ore. About Mill City eeveral new lodes promise well. Theo. Lowe has struck a veiu near the Ohio Gulch eaid to promise well. Jacob Snyder has his arastra running on ore from the Albro lode, obtaining six to eight ounces gold per cord. Work is about being re-commenced on the Lincoln tunnel, by the King Bros.

BULLION.—Denver *News*, 16th: At the First National Bank to-day were four bars of gold bullion, weighing 336 ounces, and valued at $7,000. At the Colorado National were seven bars weighing 800 ozs., valued at $17,000. During the past three days the U. S. Mint has turned out 36 bars, weighing 2,200 ozs., and valued at $50,000.

LAKE COUNTY.—Letter from Granite: Matters are looking up. Rich ore is coming out of the Yankee Blade. Free gold visible. The mill will be in running order by July. Pertridge is getting fine ore. He and Dr. Morrison have been runniug their mill on the Hattie Jane end Solux Tyee lodes with grand results.

The great excitement of ths hour is the discovery of a gigantic lode in the vicinity of the Yankee Blade. It is called the Johnston, and takes the shine out of every lode in the district. At a depth of 21 feet the vein is four feet wide. The ore is literally peppered with gold.

Idaho.

NEW DIGGINGS:—Idaho City *World*, June 18th: From Mr. Smith, Deputy Collector, we get information of new diggings 18 milee from this city, on the main Boise river, ebove the mouth of More creek. Mr. Smith and his brother sunk holes 20 feet, and obtained from 10 to 50 colors all the way down. Along ou the river bars, for a long stretch, where free water can be had for nine months in the year, Mr. S. thinks the diggings will pay from $6 to $8 per day to the hand.

WARREN'S DIGGINGS.—Mr. Bacon reports miuing at Warreu's to be prosperous in placer mines, with a fair eupply of free water. In quartz mining a good deal is done. The Pioneer mill, put up two years age, is crushing custom ores, and the water mill is running on ores from the ledge owned by the mill company or from neighboring ledgee. A lot of 53 tons of ore out of the Rescue ledge gave a product of nearly $50 per ton all through, and some of it went above $80.

FLORENCE.—The mines are paying better than for two or three years. But, through lack of water, mining will soon bs over for this year.

MOOSE CREEK.—The mines have already commenced to fail. Only a few have gone there from Warren's, but nearly all who had were back again. All pronounced

the diggings comparatively a humbng. The area of mining ground is limited, and the richness of ths best clsims have been overrated. A few had sncceeded pretty well, aad the traders who got in first had made money.

Silver City *Tidal Ware*, Jnne 22d: Al. Cago writes us from Middle Fork, Owyhee, June 14th: "I think that at least two large lsdges already found will prove to be paying ones. There is also an extensive range of 'wash gravel' here, apparently all ou the surfacc.

Nevada.

COPE DISTRICT.

Shermantown *Telegraph*, June 21st: From Messrs. Furst aad Cavuaagh, just returned from Elko, we glean the following. The reported new diggiags to the north of Elko are a grand hnmbng, the excitement having bcen got up to assist the sale of a lot of plng horses.

Inland Empire, 22d: Persons returning to this city from the reported rich gold fields north of Elko, geuerally report the same a hnmhug. It is said that there is one gold bearing ledge of undouhted merit, and aside from this there are no mines, of any character, in that whole section of country.

REESE RIVER.

Silver Bend.—*Reveille*, June 26th: Belmont is beginning to recover from the effects of the White Pine fever. The town is alive again. The principal ore yielding mine of the dlstrict is the El Dorado South, beloaging to Messrs. Leon & Co. The maiu incline is down 270 ft., and shows a well-defined vein in its eatire course. At 240 ft. the vein has been piercod and shows a thickness of nine feet of sulphurct oro. Assays reaching up to a thousand dollars can he obtained from this portion, and Mr. Leon is sure that it will yield $150 per ton at the mill. Upwards of 500 tons of ore aro out ready for the mill.

Besides the El Dorado South, ore is being takeu out of the Transylvania, though the work is restricted to a company of miners who have a contract for takiag out ore near the surface. A number of other mines are beiag prospected, and there is some talk of the Combination Co. resumiug operatious.

Battle Mountain.—The business of shippiag ore to San Francisco has been inaugurated, and the result satisfactory, though the railroad charges $14 per ton, a price which will be greatly rednced after the 1st of July,

Miniag is carried on with activity. The Great Ceutral Silver and Copper Mining Co., have commenced on a number of claims and will soon ship ore.

The Battlo Mountain Copper and Silver Mining Co. are working the Bay View and Red Rover ledges, and are sacking ore for San Francisco.

The principal mines now in process of developmeat are the Uaion, Arizona, Mouataiu View, and Red Rover. A nnmber of discoveries, hoth in silver aad copper, have recently heen made. A. Jacobs & Co. have discovered a mine of argentiferous galena which assays up in the huudreds, and the camp has a lively appearance.

The Silver interest in the district looks promisiag. The Little Giant mill, of five stamps, has averaged $1,000 per day for the last six months. It crushes wet, without roasting, and is distant about seven miles from Battle Mountain Station.

The Mettacom.—This mill has been undergoing repairs and will be started on the 1st of July, on the orcs of the Buel North Star miue, of the Lane and Fuller Co. The mine is now yielding six tons of high grade ore per day.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

Chollar-Potosi.—*Enterprise*, 23d: This mine is yielding at the rate of 230 tons per day, averaging $48. The drift north at the 1,100 ft. level has reached the Hale & Norcross south line.

Looking Well.—Same of 26th: The Sierra Nevada mine is looking exceedingly well, and the mill is running to its full capacity.

Being Overhauled.—Messrs. Fair & Mackay, who lately purchased the Trench mill, at Silver City, are refitting the same. Two new boilers are just put in place, each 16 ft. long by 58 in. diameter.

Still Burning.—27th: The fire in the Crown Point and Kentuck mines, Gold Hill, is still burning. It has been so walled in that it cannot go beyond certaiu bounds, which is all that could be dono, and it will probably burn in a smouldering way as long as there is any timber in that portion of the two mines which has been abandoned.

The Bullion.—The drift east, at the 2,400-ft. level, is still progressiag.

Chollar-Potosi Bullion.—We yesterday saw 16 hars of bullion from the Chollar-Potosi, valned at a little over $40,000. The yield of the mine thns far, duriag the month, has been $110,000, and by the end of the month will reach $160,000.

Good Yield.—The Hale & Norcross is yielding over 200 tons per day. The connection with the Chollar-Potosi has been made, and there is now a good circulation of air in the lower level.

Occidental.—The Occidental Co. are making good progress with their new tunnel. The rock is becoming softer; water about the same.

Imperial-Empire Shaft.—This shaft is now down 1,157 ft. No ore has been fonnd as yet.

Kentuck.—About 50 tons of ore per day is being raisod from this mine.

WHITE PINE.

Bullion Hill.—*Inland Empire*, June 22d: In Bullion No. 10 a shaft has been sunk 30 feet, and vein matter found for a width exceeding the depth of the shaft, as no wall-rock has beeu encountered on either side. This mine is yielding chloride ores of high grade. The other mines have not been so far developed, but all show high grade ores. We saw ore taken out which contained black horn silver similar to that of the Cole & Johason mine in Piato District, and from which we published an assay of $21,373.51. We brought away two specimens of ore that the best mines on Treasure Hill need not disown. They are as perfect specimens of horn silver as were ever seen.

Items of Mining Progress.—*Empire*, 20th: Pogonip and Othello center shaft ore yielded by assay $700 to the ton.....22d: The Hidden Treasure (original) is yielding excellent ore. In the southern works the deposit is on the increase in quantity and quality. We were shown specimens which were almost the pure quill—horn silver. ....23d: A body of rich chloride was struck a few days ago in the Burns shaft on Chloride Flat.....24th: A rich strike in the Ince Hall mine: near the Eberhardt, yesterday. A specimen ncarly pure horn silver, and weighing from 20 to 30 pounds, is on exhibition.....Among the articles placed in the corner stoae at Shermantown, Thursday, was a specimen of ore from the Keystone shaft, Eberhardt mine, worth accordiag to assay, $24,000 per ton. It was reduced to a perfect square by sawing, and upon either side bore the stamp of a $20-piece. Dr. E. X. Willard and John Turner donated it for the purpose mentioned..... *News*, 21st: Four tunnels are piercing the hill south of the Mazeppa mine.....The Little Bilk, on the northwestern slope, has a shaft 32 feet down, and fine indications. ....Operations have been commenced on the Dreadnought.....Five men are at work in the Phœnix shaft, now down 100 feet, with flatteriag prospects.....The Paris, on Pocotillo Flat, has a 38-foot shaft. The ore increases in richness with the desccnt..... 22d: Omega shaft is down 85 feet, well timbered.....23d: The rich ore in the Mazeppa still holds out.....Rich chloride ore is coming out of the Nettie Lamar..... Charter Oak shaft down 60 feet.... The sonth incline of the Hidden Treasure Consolidated is down 51 feet, and the ledge is widening. The face of the incline is a mixture of black spar and quartz, with a fair amount of pay ore.....Work ou the Silver Wave is prosecuted day and night. The shaft is 40 feet deep. Ten tons of ore is sacked upon the dump.....25th: The Burns mine, on Chloride Flat, yesterday, struck pay ore.....The Manhattan mine, on the western slope of Argyle Hill, started up yesterday. The two parallel shafts of the old Argyle, 30 feet deep (inclining on the foot-wall), are being connected at the bottom by a drift, from which rich chloride ores are being taken.

Mills and Smelting Works.—*News*, 22d: Yesterday, sixteen ox teams loaded in Elko with the machiuery for one of the best 10-stamp mills in the country—to he taken to Reveille and put in running shape in 90 days.....23d: Lucas & Logan's, at Swansea, a grinder of capacity equal to ten stamps, is now so far advanced that it will be in operation within three weeks....Mosheimer's smelting works, in the cañon near the County Hospital, are approaching completion. The boilers were put in position yesterday, and workmen are now building the furnaces.....Elko *Independent*, June 21st: The Metropolitan mill is the most convenient of any we have seen. The company have some 50 tons out, the crushing of which will be commenced on Saturday. ....Same of 25th: On Sunday and Monday 300 tons of freight, consisting of lnmber and machinery for Stanford's 30-stamp mill at Eberhardt City, left Elko.....Treasure mill continues to crnsh daily abont 36 tons of oro, and has a supply of 500 tons on the dump.

Bullion.—*News*, 23d: Wells, Fargo & Co. yesterday made what we believe was the heaviest shipment of bullion ever made in one day from White Pine—fifteen hars to San Francisco, $16,465.61, and three hars to the Eastern States, worth $5,657.61, making a total of $22,123.22.

From the "Mining Review" of the *News* for the week ending June 19th, we extract the followiag: "Treasure Hill now employs 1,463 miners, who extract 435 tons of good milling ore daily, and snpply of ore now lying upon the various dumps awaiting milling facilities amounts to 4,171 tons. According to milling tests of fair samples of this ore, it yields under stamps from $100 to $600 per ton. We have shipped this week $65,078.63, and with the ore on dumps and at the mills, we have about $1,500,000 left."

New Mexico.

Moreno Mine.—"S." writes the Colorado *Register* from Elizabethtown, June 10th: "Maxwsll's lode is the richest on record. For three weeks the quartz has yielded at the rate of $210 per ton. It has one shaft 80 feet deep and drifts esch way 50 feet. The orevice averages three feet from the surface down. Mr. M. has a 15-stamp mill, and for three weeks has taken out from $15,000 to $16,000 per week. Many other lodes have been discovered, some of which promise well. Gulch miniag is prosecuted with vigor. Evcry company that has water is hard at work, Moreno ditch is heing brought to completion. Already the water is turned in at the head, and 12 milcs puddled."

Tierra Amarilla.—Albuquerque *Review*, May 29th: It is reported that gold has been discovered in large quantities at Tierra Amarilla. Several nuggets of considerable size were found.

Utah.

Ogden.—Corinne *Reporter*, June 22d: A mining district has been organized in Ogden, and mining laws adopted at a meeting of the Saints, which conflict with the U. S. mining laws. A number of rich quartz specimens have been brought to town by parties who are dumb in regard to the locality. We have no reliable information, but infer from the orgaaization of a maining district the other day, that something is in the wind. The Mormons have become aware that prospecting parties are in the mountains, and many have knowledge of argentiferous deposits which might be stumhled upon by hunters, who would locate and work them in the very face of the Church; hence the organization of a district hy the Saints to secure the valuable ground, if there is any.

Wyoming.

South Pass Items—*Sweetwater Mines*, June 16th: Pony Steel and Dr. Bar, on the Dexter lode have a shaft down 12 feet, and the quartz is looking fine....A coutract has been let to sink 35 feet deeper on the Nellie Morgan....Argenta is a ledge discovered by Sayder and Dixson on the 12th inst. There is a crevice of 18 iaches, and the quartz exhibits free gold in abundance. The ledge is on the Jim Dyer hill.

Rock Creek.—The Savage boys have struck a rich streak in Rock creek 20 feet wide. The company are putting in a bedrock flume, and will be ready for mining iu a short time. All the claims in Rock creek are paying well.

Mason & Co's 10-stamp mill arrived on the 14th inst. The machinery is the finest ever turned out of the Eagle Works at Chicago. We believe it is the intention to run on custom rock.

Tin-foil Wall-Hangings.—A new French invention is for painting in oil upon tinfoil, to be applied to walls in a somewhat similar manner as paper-hangings, but with a water-proof mixture instead of the ordinary paste. This new wall cover adapts itself perfectly to all moldings and other irregularities. It receives gilding, and preserves it without oxidation. In its preparation, the tin-foil is spread upon dampened glass, and preseuts a perfectly smooth surface to the artist. By its use, the disagreeable smell of paint, which is inseparable from the ordinary method of decorating walls, is entirely avoided.

Oil for Clocks.—Fill a flint-glass bottle with common olive oil aud immerse a bright clean strip of lead in it, setting the bottle in a window, where it will be exposed to the rays of the sun for several days. All the gummy matter will adhere to the lead, leaving the oil clear aud thin, and not liable to become thick by age.

Cabinet Collections—Prof. Ward.

Prof. Osborn, of Lafaystte College, has an article in ths *American Exchange and Review*, upon economic geology, from which we extract the following:

"We hsve noticed the stirring propensity in public iastitutions to follow out the plan adopted in private collections of attempting a reputation upon some rare specimens, some beautiful 'star piece,' some unheard of species or some peculiarity which it is more than probable that no economical mineralogist, geologist, or metallurgist would ever think of seeing, or care to see again. We need collsctions of greatsr fnlness as to species and varieties, greater uniformity and comprehensiveness, and collections not overgrown or guilty of hypertrophy in only special departments, but possessing the largest varieties, and representing in their proportions the exact importance of the representative minerals, formations, and ores as nature in the field and in the bed and mine presents herself. It is variety in extent and comprehensiveaess, and representation as a whole rather than isolated beauty, rarity of individual specimen, or dovelopment of special species or classes, which is to constitnte the excellence and value of economic collections. The collection in Rochester made by Prof. Henry A. Ward, of the university in that city, is most complete. To those who have extensively visited collectious at home and abroad it will he sufficient to say that no collection of lithological specimens surpasses this, except that at the Garden of Plants, Paris, gathered by Cordier and not completed till after an experience of seventy years. Indeed, in some phases we think the American collection preferable. None covers more hroadly the fields of economical science. The varieties of species, of forms, and conditions give the student room to prepare himself for the emergencies of miaing and metallurgical practice and in this respect the study of such a collection is invaluable."

Larmanjat'e Single Rail for Common Roads.—Some time sinoe, a party of civil engineers, newspaper reporters, and men of science, met at Raincy, near Paris, to witness experiments on a new system of railroad invented by M. Larmanjat.

The track had been laid from Raincy to Montfermeil, a distance of about four miles along the public highway. The novel feature of the invention consists in a single rail, like a long ribbon, extending along one side of the road. One wheel placed at the forward part, alone hears on this rail, while the two other wheels rest on the ground. The cars are furnished with two wheels, placed underneath in their long axis, which rest on the rail and support their weight, while two other wheels, destined to preserve their equilihrium, are placed outside.

A few minutes after starting, and while the train was running at a speed of ten miles an hour, it reached a grade of 410 feet to the mile, which it asoended without any apparent slackiag of the speed. The train ran to Montfermeil in twenty minutes and returned in seventeen. The general result of this trial trip was satisfactory in every respect, and M. Larmanjat received the approbation of all present.

A French Velocipede.—M. Gnillermin's machine has three wheels, and is partially covered by an india rubber horse. This horse contains spiral springs and wheel work, which may be wound up so that the concern will run three miles without stopping. The head of the horse contains the provisions, and the body tho valise, of the rider.

Velocipede Patents.—At a meeting of manufacturers, held in New York on June 7th, it was determined to resist all claims under the Lallemont and Smith patents, and to recognize the Hanlon patents alone. A fund will be raised by subscription to meet the expenses of the expected test suit.

Interest in New York.—The *Commercial Advertiser* of June 16th, speaking of the high ruling rates of interest, says: "Wall street borrowers have to pay rates equivalent to thirty per cent. per annum on Government collaterals and fifty per cent. on stocks, while the demand from the country is increasing."

A Large Rat.—Mr. Stratton, who resides near San Leandro Bridge, killed a rat on his premises a few days since, which, the Alameda *Gazette* says, weighed seven pounds oleven ounces avoirdnpois.

San Francisco:
Saturday Morning, July 3, 1869.

Notices to Correspondents.

ESAU, Nevada.—The economically usefnl animal naturally adapted for dwelling at great elevations, are the yak, the Kiang or wild horse *(Equus heminou)*, the llama tribe, and possibly the Bactrian (two-humped camel). The yak is by far the most valuable in such positions, not only as a beast of burden, but at the same time as a milk and butter producer it is the least injuriously affected by cold or rarefied air; bnt the range of temperature at which it can flourish is only very limited. The real yak can scarcely exist during summer at an elevation lower than 8,000 feet above the sea level, and large herds in their native wilds have been observed as high as 18,600 or 18,900 feet, and on one occasion at 19,300. In snch regions these large herbivora only ohtain a subsistance by daily traversing large tracts, and consequently are good travelers. It may be inferred from the circumstance just named that they would form excellent pack animals, especially during the winter season of the Sierras.

RAINBOW.—The purple dyes obtained from coal-tar are produced by the oxidation of analine, by bichromate of potash. It is a bronze-colored substance, capahle of dissolving in alcohol, with a beantiful purple color. It is indifferently soluble in water, but more soluble in acidulated water. Like indigo, it is perfectly decolorized by the hydrated protoxide of iron; the color heing restored again hy exposure to the air. It dissolves in concentrated sulphnric acid, forming a green solntion, which, upon the addition of water, precipitates the color unchanged. Its color is somewhat intense, as one pound of the solid substance will dye 200 pounds of cotton, a moderately dark lilac. The color is a permanent one, not being acted on by light, heat, acids or alkalies.

I. Y. S.—The extraordinary erosive power of flowing water is exhibited in a most marked manner in the Himalaya and Thibet, where, according to the brothers Schlagenweit, the erosive action of many of the smaller rivers of the elevated region is 1,200 to 1,500 feet, while the larger ones traverse eroded valleys of 2,000 feet and upwards, a few upwards of 3,000 feet, steepness of descent, and great rain falls are the two chief causes.

GRINDER.—Chloriue gas, for the purpose of dissolving gold, ought not to be employed at very high temperatures, such as red or white heats, as the chloride of gold becomes decomposed at elevated heats. A temperature considerahly below boiling water, accompanied by moisture, is practically the most efficacions.

THE Mercantile Library benefit at the California Theater resulted in a sum a little short of $5,000. Of course this is not the means depended upou to place the Library on a sound financial footing; but as an evidence of the high favor in which the Mercantile Library stands with the publlic, the demonstration was unmistakable.

Volume XIX.

We herewith present onr readers the initial unmber of volume nineteen of the MINING AND SCIENTIFIC PRESS. While we are not oblivious to many imperfections and short-comings in its management, we feel conscions that we have ever pressed steadily onward in earnest efforts to furnish onr readers with a poriodical which shall not only prove a valuable medium for diffusing nseful knowledge among the masses at home, hut which shall also constitute a fair representative abroad of the wonderful resources of the Pacific Coast, and the progress which is being made for their development.

No one periodical in existence furnishes a more comprehensive record of the progress of Mining, the Mechanical and Useful Arts, Electrical and Chemical Science, and of science and research generally, than does the MINING AND SCIENTIFIC PRESS. The information given from week to week is industriously selected from every possible sonrce, and carefully considered and collated by a competent editorial corps. While we aim to he nseful, we seek also to communicate information in a manner which shall be attractive and interesting, and within the comprehension of all. There is no field of nseful research which we do not cnter and explore for the benefit of the public. How far we have succeeded in making the PRESS acceptable to its readers, we can only jndge by the words and letters of hearty commendation hy which our toil is almost daily encouraged.

During the past few months, in reply to nnmerous and earnest solicitations, we have added a new feature, to meet the growing results of our agricnltural readers, and special efforts will be made, in the fnture, to render this an important as well as an interesting department.

We are aware that much study, and wide and correct information in the manifold walks of knowledge, and in the varied wants of snch a community as this, is absolutely necessary to render a jonrnal like the one here presented acceptahle to the progressive intelligence of the age; yet it will continne to be our endeavor to meet the end desired, and to attempt to furnish the people of this State with a journal of the character indicated, and one to which they can point with pleasure and with pride as a fair representative of the growing wants and intelligence of the Pacifio Coast.

COMMISSIONER OF MINING STATISTICS.—Mr. R. W. Raymond, Commissioner of Mining Statistics, is now on his travels, collecting materials for his next annual report to Congress. We learn from the Colorado papers that he was in that region ahout the middle of June, and that he would soon proceed to the mines still further westward.

In relation to the non-reception in this State of the Government edition of Mr. Raymond's late report, we learn from a Washington correspondent that the report was printed in February or March last; bnt that it had laid from that time until the first of Jnne in the Government hindery, either waiting its turn or the pleasure of the hinder, to he bound. The report is now ready for delivery, and may be had on application to some member of Congress. In the meantime the public has been compelled to depend for their snpply upon the private edition issned by J. B. Ford & Co., of New York. From the correspondent above alluded to we also learn that there is a special anthorization for snch pnblications, by law; hence, if private publishers bind and issue sooner than the Government, we suppose it is simply because the Government is in no haste to issue, and accommodate the people with the proceeds of the labor and money which has been expended at their cost.

Guilds and Apprentices.

Skilled labor in this conntry protects itself agaiust overcrowding and competition of labor by the formation of guilds and trades unions, whose principal office is to keep prices at fair rates, and in some degree to protect labor against capital. Justice and good sense are on the side of organizations of this kind when formed and administered on a liberal and intelligent basis. It happens that the chief practical point in the working of trade guilds is the prescription of regulations to new comers making *time* or apprenticeship in the same line of business, a criterion of employment, in the place of actual qualification to do the duty required hy the employer. In some of the old countries of Europe the laws have been shaped in the interest of persons estahlished in bnsiness, and have discriminated against beginners by extremely onerons regulations—snch as a seven years' employment in snbordinate positions before, for example, brick-laying or shoe-making, or look-tinkering, can be practiced without some authoritative interference. But it has heen fouud hy American travelers in Europe that the established practicing mechanics and tradesmen that have grown into existence under snch regulations, are of the most miserable and nnsatifactory kind; that it is impossihle ordiuarily to expect a good job of any kind at their hands. Within a decade of years these laws have been repealed in one European country after another; leaving the trades comparatively free, as they are in America.

Here there are found certain easily acquired trades that wonld suffer, it is supposed, by a general deterioratiou of workmanship without some arhitrary regulation discriminating sgainst heginners. Such are printing, the iron molders, stevedores, and other trades.

The penalty against capital for a disregard of the "law" is a strike. Labor thus protects itself not merely against capital, but against unskilled labor, for the equally effective penalty against the latter is to pronounce the offender a "rat." With labor as well as with capital, might is right. By the principles pertaining to the law of force, those that go to the wall, must go rudely, and forbear complaint.

Qualification, not time, should be the criterion, the employing person being the judge,—as he is responsihle to himself for his dollars,—for when unskillful workers are allowed fair privileges the skilled ones will receive higher pay with greater certainty. Just so far as guilds and trades nnions carry out these principles to the letter, will they be safe or of real henefit to their especial trade.

It is notorious that many a beginner will lay bricks, or make boots, or stick type to more advantage in a few months than another will in from five to ten years. Mechanics of the latter class, the conservative, stagnating and sleepy kind, nndonbtedly *need* the bolstering up of unequal laws, or of arbitrary rules in their favor. But it is precisely that bnsiness which defines Aristocracy in the old world. Therefore labor on such a basis justifies Aristocracy, and is antagonistic and degrading to itself.

The practico of limiting the number of apprentices—brought to our attention by the strike of the iron molders at the Union Foundry on accouut of the employment of an extra apprentice—is a matter in which the trade guilds seem to place themselves in opposition to public interests. Indirectly it is likewise so to their own healthy condition. Why should not ten thousand hoys who may have a fancy in that way, be allowed to learu all the practical knick-knacks of the iron worker's art, in this age of iron? Or why should not every proud-spirited yonng woman be allowed or oveu encouraged to set type in this age of printing,—to possess the power of compelling shiftless printers who deem themselves too poor to marry them, at least to respect them for their virtue and frugslity?

Those who do the talking and voting in the trades unions must see to it that nothing he done by them to retard facilities for the widest acqnisition of skill in the workingman's arts and trades; for therein lies the greatness and prosperity of our indnstrial community. They shonld be aware that excellent schools of the working mechsnical arts have heen called into existence in many places, and are growing in usefulness and popnlarity as they deserve to do. The problem of building np powerful bodies of superior skilled mechanics is one to be solved liberally and in the interest of mechanics themselves; it is of snch great importance to the manufacturing and business interests of the country at large that the true principles touching the nse and employment of skilled labor are very sure to receive attention and to acquire full sway in any event, whether antagonistically to the trades unions or otherwise.

Singular Effect of Electricity on Copper Wire.

Prof. Partz, of Oakland, has placed upon our table a qnantity of insnlated copper wire, which once constituted a relay in a telegraphic office near this city; but which has heen rendered useless, in consequence of the passage through it of a current of atmospheric electricity, which had been conducted into the office by the line wire. The relay had heen hrought to this city to be repaired; but on heing removed from the coil for inspection, it was discovered that a high degree of elasticity had been imparted to the relay, as is supposed, by the electric current. In fact the relay is almost or qnite as elastic as though it had been made of steel instead of copper wire; the wire has moreover heen at the same time hardened or tempered.

As this change must have been brought abont hy the electric current, the fact hecomes one of no little consequence, in view of the practical importance, to which it points of the possihility of hardeuing copper by electricity. The press has frequently recorded the fact of currents of atmospheric electricity having passed through, and more or less injured relays, in various telegraphic offices. Has any effect similar to this ever heen noticed before? Such change may possihly have been produced heretofore without being noticed; In the present instance, it was not observed by tho operators in the office, and was only discovered by the party in this city, to whom it was brought for repairs. The electricity which has heen induced renders the wire unsuitable for again being coiled for a relay.

TREATMENT OF REBELLIOUS SILVER ORES BY AMALGAMATION WITHOUT ROASTING.—Mr. Charles H. Aaron's valuable article on this subject, published in the MINING AND SCIENTIFIC PRESS of April 17th, has attracted snch attention from metallurgists that the author has heen persnaded to enlarge somewhat upon that question, and to issne the entire in pamphlet form. The additional matter, which has not hitherto appeared in the PRESS, comprises: General Considerations; Modification of the Process; Precautions to he Observed; Obstacles; To Know if the Ore can he Worked in this Way, and Notes contaiuing Reasons for the Foregoing. Published by Dewey & Co., price 25 cents.

PROF. WHITNEY, late of the California Geological Survey, together with eight other College Professors of note, and a son of Sam. Bowles, are coming to spend July and August in the Sonth and Middle Parks, for the purpose of making a geological examination of the country, and enjoy themselves in camping out.

SCHLAGENWEIT lectured in English on Friday evening.

Sheffield Scientific School of Yale College.

The oldest and most renowned of our special scientific schools still prospers and takes the lead amongst schools of the kind, now becoming quite popular in this country. It is the starting point of a great number of our best men who are not of the high school order—universal scientists supposed to be perfect in everything,—but men who have won merited reputation in some particular department to which they have devoted themselves.

Such influences upon national character as the Yale Scientific School and other like special institutions, in which thoroughness or nothing is the rule and habit, must be regarded as of the highest importance in their peculiar way, and not any more to be undervalued than the military unity by which the world has now learned to recognize our country quite deferentially as an individual nation.

Readers of new American literature and critiques have noticed the change within a few years, by which it has ceased to be a necessity for an author to be endorsed in England before America will have any conclusive opinion of his merits. It was the want of an enlightened public opinion that made us thin-skinned, sometimes, when we were abused by foreigners. The pitiable and most mortifying spectacle of going to Europe for an opinion regarding ourselves, is a thing of the past. In scientific matters there has been wanting, also, an enlightened public opinion, the effect of which has been curiously different—the existence in every locality of a considerable number of boldly assuming, but secretly little self-respecting persons, who are esteemed above the honest men of science, while our noble and world-renowned scientific men are strangely undervalued, or almost unknown to our worthless "public opinion." The first geologist of our times, certainly amongst the greatest living lights in that science, esteemed in Europe quite as highly as are Lyell, Murchison and Naumann, is Dana, who is not merely an authority, but is the author of the best comprehensive works on Geology and Mineralogy extant in any language, a deep philosopher of the problem of creation, and, as scientist and man, worthy of our profoundest reverence. America, newspaporially, has never been proud of Dana, nor of its other worthy men of the same stamp, who do not "blow;" but that matters little. As in literature, there is already formed in this country a well established democratic public opinion, upon scientific matters, that will take care of itself without the least necessity for fine verdicts or authoritative thunder from any quarter. Such has been the influence of our special scientific schools.

The officers of the Yale School for 1867 were as follows:

President—Rev. Theodore D. Woolsey, D.D., LL.D. Professors—Wm A. Norton, M.A., Civil Engineering and Mathematics; James D. Dana, LL.D., Geology and Mineralogy; Benjamin Silliman, M.D., General Chemistry; Rev. Chester S. Lyman, M.A., Industrial Mechanics and Physics; William D. Whitney, Ph.D., Modern Languages; George J. Brush, M. A., Mineralogy and Metallurgy; Daniel C. Gilman, M.A., Physical Geography; Sam'l W. Johnson, M.A., Analytical and Agricultural Chemistry; William H. Brewer, M.A., Agriculture; Alfred P. Rockwell, M.A., Mining; Daniel C. Eaton, M.A., Botany; Othniel C. Marsh, M.A., Palæontology; Addison E. Verrill, B.S., Zoölogy.

Instructors—Mark Bailey, M.A., Elocution; Louie Bail, Drawing and Designing; John Avery, M.A., Physics, etc.; James B. Stone, C.E., Mathematics; Beverly S. Burton, Ph.B., Chemistry; Charles J. Sheffield, Assaying.

One hundred and twenty-three students were in attendance in 1867.

The *White Pine Evening Telegram* of Shermantown, and the *Elko Independent* are two new papers that come with a flourishing appearance; published respectively by McElwain & Allen and by E. D. Kelley & Co.

A Noted Oratress.

Miss Anna E. Dickinson lately arrived in this city, over the continental railway. She speaks of greatly enjoying the mountain scenery, and was so particularly delighted with the views in the Sierra as to ride from Truckee over the summit on the locomotive, in order to have an open view of nature's grand wonders.

Although yet comparatively young, (in her twenties) Miss Dickinson is undoubtedly the most noted and talented female speaker of the age. She is thoroughly a self-made woman.

It was our fortune to make her acquaintance at her mother's residence in Philadelphia, in 1861, at the time of her maiden appearance before a Philadelphia audience. She had spoken a number of times previously in the country, and up to that date had been strenuously opposed by her widowed mother and other members of the household. But spirited, determined, and successful, her family no longer deemed it prudent to oppose her decided inclination to public speaking. Her labors for the elevation of oppressed humanity in the intervening years, have made her better known to our readers than any newspaper article which we can indite.

As to the true merits of Miss Dickinson's reputation for lecturing, our community will soon have an opportunity of personally judging, she having decided, (after receiving urgent propositions from various quarters), to speak at least a few times in San Francisco and some of the larger places in the State.

Miss Dickinson is the youngest of the family. Her mother, an aged, orthodox Quaker, "still lingers in the lengthened shadows of life," and is one of the frankest, kindest mortals we ever met. Grateful and patient in the infirmities of age, she seems fittingly the waiting guardian of a naturally kind and amiable family.

The Coming Fairs.

The State Agricultural Fair is to commence at Sacramento September 6th, and continue for six days. Twenty thousand dollars in coin will be distributed in premiums. The Fair of the Mechanics' Institute will not open until September 14th, two days after the State Fair closes. Thus there will be no clashing. The mechanics and manufacturers of San Francisco can contribute to both exhibitions without detriment to local or special interests, while those of the interior can arrange for sending their articles hither in turn. The several new railroads completed and in progress toward the two great commercial centers—Sacramento and San Francisco—will offer increased facilities over former years for the transportation of articles for exhibition, and greatly facilitate personal locomotion to and from the places of exhibition. This circumstance, coupled with the fact that extraordinary exertions are being put forth to render these exhibitions more comprehensive and entertaining than they have ever before been, will no doubt largely increase the number of visitors to both the State Fair and the exhibition of the Mechanics' Institute.

The San Joaquin Stock and Implement Association also announces that it will give an exhibition this fall, at which liberal premiums will be offered. The premium list and time for the exhibition will be given to the public in a few days.

The Congressional Committee of Ways and Means, accompanied by their stenographic Secretary, Mr. Smith, of the House official reporters' corps, have been engaged not merely in pleasure excursions, but in hearing testimony, and making visits of inquiry connected with a variety of matter of importance to the revenue and interior departments. Oregon and Alaska will receive their attention. They depart in a few days for a voyage on the Columbia.

The Expedition of the "Summer Cloud,"

In search of a Lost Gold Ledge in Alaska, which sailed Thursday, June 17th, takes with it our imagination, and a lively interest in the haps and mishaps that may befall the "bold adventurers"—seven men, all told, including crew and company, viz., Thomas Haggott, Captain; Jonas W. Bowman, George Tew, Christopher Ford, Hugh Gallagher, John Hannah, and Joaquin Torres.

Their "ship," an unornamented schooner, might easily be mistaken, if not the crew as well, for one of those old Spanish visions of exploration belonging to another age, when Spanish blood was free; and the party might be imagined to be led, perhaps, by another Velasquez or Cortez,—should we take our glance of the idle craft as it makes long, and slow-advancing tacks against the North wind off Point au Reyes and Cape Mendocino, or follow it like the gulls and see how the men will toss overboard the anchor in Nootka Sound, or some yet unnamed Alaskan bay with a bosom of the ocean's blue, and lining of wholesome forest of the emerald's green, bounded with lofty ribs of glacial snow.

The origin of the expedition is as follows: Several years ago a few men were sent ashore from a vessel for fresh water at some out of the way place, several hundred miles north of Sitka. In the stream from which they obtained their supply, they found a quantity of quartz, of which they brought away a few samples. When these specimens were assayed at the Sandwich Islands and in this city, they were found to be exceedingly rich in gold. Several unsuccessful voyages have already been made to re-discover this El Dorado, and the party are in possession of additional information.

The Summer Cloud cleared for a fishing and hunting excursion. She was fully supplied with an outfit of stores, mining tools, fishing tackle, and such articles of merchandise as are generally required for trading with the natives for furs. Whether they discover gold or not, the adventurers intend to make a paying voyage of it, by fishing and trading. Unless captured by the treacherous Indians, a risk not small on those aboriginal shores, the expedition will return in about four months.

Death of Justus Adelberg.—This accomplished mining engineer, late member of the firm of Adelberg & Raymond, died at Hoboken, on June 5th, of disease incited nine years ago by the inhaling of fumes of mercury, in some metallurgical experiments. He was born in Hesse Cassel; was a student and favorite of Bunsen's at Marburg; at the age of 22 conducted a large government chemical manufactory at Hanover, and in 1848 joined the liberals and was of course proscribed and obliged to emigrate. He lived five years in England, came to this country in 1854, at the age of thirty, visited our manufacturing centers, and soon after married and became identified with American mining industries, in which he has been an instrument of power and usefulness.

Report on the Precious Metals.—The report on the precious metal, at the Paris Exposition, by Prof. W. P. Blake, has been issued, both at the Congressional Printing Office, and by Putnam & Co., of New York. An invoice of the private edition of the same, neatly bound in cloth, has been received by Bancroft & Co., of this city. As the House of Representatives have not ordered any of these reports for their use, the Government edition can be had only on application to some member of the Senate.

Valuable data from the Nevada argentiferous limestone districts, will be found in the communication of "Las Minas," on the second page of this issue.

Mechanics' Institute--Quarterly Meeting.

The regular quarterly meeting of the Mechanics' Institute was held on Thursday evening, at their rooms on Sutter street, President Hallidie in the chair. The regular quarterly report was read, from which it appeared that the Institute has now 1,254 members, with 12,646 books in the library—an increase of 216 since last report. The receipts for the past quarter have been $4,287, against an expenditure of $3,936. An expenditure of $3,000 was authorized by the Institute for certain needed improvements and alterations in the present building, by which it is said the income therefrom may be increased $100 per month.

The President, Mr. Hallidie, made a most satisfactory verbal report upon the progress which was being made towards the coming Fair.

Polytechnic Branch.

Mr. Herrick reported a proposition for the formation of a Polytechnic Branch of the Institute, which was favorably received by the members present, and the matter referred to a special committee, consisting of W. B. Ewer, Irving M. Scott, William F. Herrick, and David Farquharson. The design of this organization is to procure the preparation of essays on various subjects of a useful and practical character, to be read at the monthly meetings of the Institute, or at such other times as may be deemed expedient. This organization will be effected and carried on upon a plan similar to the Polytechnic Branch of the American Institute of New York, and if properly conducted, cannot fail to add much to the interest and value of the Institute. The first paper will be read at the next monthly meeting.

Roach's Quicksilver Furnace.

This furnace for extracting quicksilver from its ores, which has been secured by patents through this office, dated in April and July, 1866, and which has already been noticed in this paper, was put up some months since on a mine at Pecachoes, Monterey county. About ninety tons of ore were put through it, with a given result. Subsequently, as we are informed, another lot of the same class of ore was put through an ordinary brick furnace, with a less yield, showing a marked advantage in cost and yield by the use of Roach's patent. It has long been apparent that the present mode of treating quicksilver ores is cumbersome, expensive, and lacks thoroughness. We should be pleased to see the invention subjected to a thorough and continued trial. Mr. Coalt, who was formerly associated with Mr. Roach in the proprietorship of this furnace, has sold his interest to Mr. R., who is now sole proprietor.

Pioneer Fuse Factory.—Gases evolved from the drying of the varnish (it is supposed) on some fuse left unattended in the varnish room of the Pioneer Fuse Factory at the Potrero ignited that combustible material on Tuesday; and the entire works were destroyed by fire. Fortunately there was ordered some time ago a lot of new machinery which has already arrived. It will take the place of that destroyed, and the factory will be on a producing footing again in the remarkably short time that burned-out San Francisco manufactories are wont to be reconstructed, under such circumstances. One is almost inclined to justify a little of accidental burning down or other misfortune, as efficient and wholesale if not very profitable advertising to those who ought to be patrons of the manufactories in question. Lose $25,000, without insurance.

The cotton crop, from all accounts, will reach or closely approach three million bales. The anticipations of injury to the crop have not been realized; and no trouble is now feared from lack of laborers, as the negroes have got their fill of politics, and are now ready to go to work.

Professional Cards.

Notice To Mining Companies.

The undersigned offers his services to the mining public. Having devoted several years to the study of mining and metallurgy in some of the best schools and works of Europe and being acquainted with the metallurgical treatment of ores as practiced on this coast, he is confident of his ability to render valuable aid to parties employing him.

CHAS. C. RUEGER.

Address, cero of Mining and Scientific Press. 23v18

J. S. PHILLIPS, M. E.,

CONSULTING ENGINEER,

Examiner of Mines, etc.,

423 Washington street.....San Francisco.

(Having had 33 years' experience in Europe and America,) supplies drawings and designs for Pumping, Hoisting, Crushing Separating, Roasting, Chlorinizing, Milling, Leaching, Precipitating, and Smelting Works. Minerals analyzed, and advice given for beneficial treatment. Lessons on the Discrimination and Assay of Minerals by Blowpipe, Chemicals, Scorifier and Crucible. 4v17tf

MOSHEIMER'S

PIONEER MINING SCHOOL,

—AND—

METALLURGIC WORKS.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of

Chemistry, Assaying and Metallurgy,

That I am prepared to teach all the above branches in less time than in any European School.

I also undertake to assay and work any kind of ore, or mineral substances.

For terms, apply to **JOS. MOSHEIMER,**
Practical Chemist and Metallurgist.

Office, 328 Montgomery street; Metallurgic Works, 2005 Powell street, San Francisco. 6v18-6m

LEOPOLD KUH,

Assayer and Metallurgical Chemist,

(Formerly of the U. S. B. Mint, S. F.)

Office, No. 611 Commercial Street, opposite the Mint, San Francisco.

BULLION MELTED AND ASSAYED,

The correctess of which is guaranteed in every respect All kinds of Ore and Mineral tested, assayed and analyzed in the most satisfactory manner.

Refers by permission to W. C. Ralston, Cashier Bank of California; Messrs Pioche & Bayerque, Wm. M. Lent, John D. Fry, E. Cahill & Co., A. K. Orim, President Pacific Union Express Co.; John M. Eckfeldt, M. and R. U. S. B. Mint; Hale & Norcross S. M. Co., and the principal mining companies on the Comstock Lode. 25v17-tf

PROF. HENRY WURTZ,

Formerly Chemical Examiner in the U. S. Patent Office may be employed professionally as a SCIENTIFIC EXPERT. Geological Examinations and Reports, Analysis and Assays, etc., etc. Practical advice and investigations in the Chemical Arts and Manufactures. Invention and examination of new chemical methods and products. Address, 26 Pine street, Rooms 35 and 36, New York. Always in from 12 to 3.30. ☞ Written communications preferred.

Important to Gold and Silver Miners and Companies.

PROFESSOR WURTZ,

Who is the Inventor and Patentee of the new and wonder full uses of SODIUM IN WORKING GOLD AND SILVER ORES AND JEWELERS' SWEEPINGS, will furnish at the above address information in relation thereto, together with experimental packages of

SODIUM AMALGAM.

All instructions and experiments elsewhere obtained are spurious and unreliable. WORKING EXPERIMENTS ON AMALGAMATION OF ORES, Etc. Prof. W. has in operation in New York a large and small Hepburn Pan, for work ing 1,000 or 20 lb. charges of material for experimente purposes. 3v17-1y

To Quartz Mining Companies.

To be sold positively within the next three months—the MINES, ENGINE, MILL, and entire Machinery of the TEMPLAR NO. 2 Quartz Mining Company, located at Indiana Ranch, Yuba County, consisting of—

One Steam Engine, 60 horse power, made by Burden, Brooklyn, New York.
Two large Boilers, in complete order.
One Eight-stamp Battery.
One Chile Mill.
One Cornish Lift-Pump, 6 inches, of superior make and finish.
280 feet of 5 inch Iron Suction Pipe.
One large Water Tank.
And also all of the necessary machinery, with Belting, Feed Pumps, Hose, Turn Tables, Cars, Ropes, Track Iron, Flumes, Plates, with Blacksmith Shop and all Tools and requisite implements to be found in a large and first class quartz mill.

The Company having ceased operations intend selling off their effects as speedily as possible.

Mining.

SAFETY APPLIANCES.—The eccentric toothed safety catch, for mining cages held in place by guides,—to arrest fall if the rope breaks,—is in use nt the Belcher, Crown Point, Chollar-Potosi, and other mines on the Comstock lode. At the trial of a new one recently, the maker, William Bray, the Belcher mine blacksmith, and Robert Bross, foreman, got in, while another man cut the rope. The cage fell 1¼ inch before it caught; would otherwise havo fallon 850 feet. Safety gates, to prevent cars from being rnn into the shaft carelessly while the cage is not there, have also been applied at tho Belcher mine by Daniel Grant, the carpenter. A stout spring eam at each side of the shaft keeps the gates closed; but the cage on coming up presses against the cams, nnd these, by means of connecting-rods, push tho gates open.

BLASTING.—Vau Bokkelen and Smith, in the courso of some blasting experiments in the Sierra Nevada mine, sunk a hole 12 to 15 feet, and exploded in it without tamping a light charge of giant powder, to enlarge the cavity; then poured in a keg of common powder, which wns tamped with sand, nnd set off with unexpectedly favorable results. * * A little electric machine to eet off blasts has been tried on Telegraph Hill. It works admirably when properly understood; and therein lies the solo hindranco to the general employment of electricity in the place of the slow nnd unreliable fuse. "Simplicity in the apparatus and a little schooling, shonld soon supersede fuse altogether, in the gravel mines especially. * * Tin canisters containing 75 to 175 ponnds of blasting powder, a total of 1,000 pounds, were attached to the surface of Blossom Rock under from six to twenty-four feet of water, and set off by electricity—and found by Lieut. Hcuer to loosen 49¼ cubic yards of rock. Nevertheless it is deemed cheaper to drill, and insert the cartridge in the usual manner.

Adams' Hydraulic Wheel.

One of these wheels, twenty-two inches in diameter, is in operation in the Union Mining Company's claim at Port Wine, Sierra County, says the *Messenger*. The water is taken from a reservoir near the surface, and conveyed in a 7-inch pipe dowu a shaft one hundred and ten feet in depth, thence along the side of the tunnel 2,000 feet to the wheel. The wheel has sliding steel buckets two inches square. About ten inches of the lower circumference of the wheel is enclosed in n tight-fitting jacket, the water acting on the buckets for that space only. When the water has ceased to act upon a bucket it is thrown backward into the wheel by small cams attached to it, and held iu that position until the wheel has made a revolution, when the bucket is again thrown forward to be acted upon by the water. It is adapted to great hights and scarcity of water.

ITEMS.—Santa Cruz is replacing its wooden water pipes with wrought iron ones, joined by cast iron couplings; Messrs. Authony & Burrows doing the work.... Wharf building in San Francisco bay is largely done by particular firms as a specialty. J. A. Fulton has contracts, amongst which are: the wharf for T. L. Moyer, Santa Cruz Island, 400x24 feet, for $7,500; one for Ben. Holladay, at Monterey; the Vallejo flouring mill foundation, building by Pierson & Starr, for $15,000; and one for the Gas Company, foot of Second street, 130 feet long, for $5,200....The The present Sacrameuto and Yolo bridge is 900 feet long, cost $50,000, and rests on seven substantial pile piers. The Americau river Pacific Railroad bridge, a superior "How," is 500 feet long, rests on five pile piers truss, and cost $50,000, iuclnding half a mile of trestle work. The proposed Rincon Hill bridge in San Francisco is to be eighty feet long, and will cost $97,000—public money.

PUBLIC SURVEYS.—Congress has appropriated for public surveys the ensuing year in California, $50,000; in Arizona, $5,000; and limited the rates por mile for ruuning standards to $15, for township and section lines, to $10 per mile. The Commissioner directs the Surveyor General to expend a reasonable share of the appropriation in California in surveying lands along the route of the Central Pacific Railroad, in mineral regions, and in other localities where the public interest may be snbserved. In Nevada, along the Pacifio Railroad (Humboldt and Landor counties) 230,400 acres, watered by the Humboldt River and now easily accessible, have recently been reported by the Virginia City office as snrveyed. In Oregon there is a tide of emigration flowing southwards, and the *Sentinel* calls for the survey of the Goose Lake country.

School land warrants, Cherokee scrip and other papers giving to holders the preference in a certain order well understood, follow up the surveys wherever there is a valuable timber or other good land; so that the price received by the government for desirable timbered land, for example, in the Sierra Nevada, is not less than $5 per nere.

IMPROVISED DITCHING MACHINE.—Dr. Parsons, of Denver, Col., uses for ditching a V-shaped wooden frame, twelve feet long and four feet wide at the rear end, pointed with sheet iron. After the ditch is plowed, a team of four yoke of oxen is attached, and the machine is hitched so ns to be drawn at an nngle of forty-five degrees; the lower side keeping in the bottom of the ditch and the other crowding out the dirt so as to form an even and regular bank. One round will open a ditch about fifteen inches deep aud seven feet wide. A team and three men will complete two miles of ditching per day.

PAPER PROTRACTOR.—An English engineer, J. Perrins, recommends to surveyors the use of a lithographed paper protractor, which not only costs less than brass, but can be used with greater accuracy and expedition. The common brass protractor is seven to ten iuches in diameter; this is fifteen. Iustead of pricking the bearings on the plan, both injuring and soiling it, on this any bearing may be seen and plotted at once. A protractor of this kind should lie in everybody's note-book.

Ayer's Cathartic Pills,
For all the purposes of a Laxative Medicine.

Perhaps no one medicine is so universally required by everybody as a cathartic, nor was ever aay before so universally adopted into use, in every country and among all classes, as this mild but efficieat purgative *Pill*. The obvious reasoa is, that it is a more reliable and far more effectual remedy than any other. Those who have tried it, know that it cured them; those who have not, know that it cures their neighbors and friends, and all know that what it does once it does always—that it never fails through any fault or neglect of its composition. We have thousands upon thousands of certificates of their remarkable cures of the following complaints, but such cures are known in every neighborhood, and we need not pubbsh them. Adapted to all ages and conditioas in all climates; containing neither calomel or any deleterious drug, they may be takea with safety by anybody. Their sugar coating preserves them ever fresh and makes them pleasant to take, while being purely vegetable no harm can arise from their use in any quantity.

They operate by their powerful influeace on the internal viscera to purify the blood and stimulate it into healthy action—remove the obstructions of the stomach, bowels, liver, and other orgaas of the body, restoring their irregular action to health, aad by correcting, wherever they exist, such deraagements as are the first origin of disease.

Mlaute directions aro given in the wrapper on the box, for the following complaints, which these *Pills* rapidly cure:—

For **Dyspepsia** or **Indigestion, Listlessness, Languor** and **Loss of Appetite,** they should be taken moderately to stimulnte the stomach and restore its healthy tone and action.

For **Liver Complaint** and its various symptoms, **Bilious Headache, Sick Headache, Jaundice** or **Green Sickness, Bilious Colic** aad **Bilious Fevers,** they should be judiciously taken for each case, to correct tho diseased action or remove the obstructions which cause it.

For **Dysentery** or **Diarrhœa,** but one mild dose is generally required.

For **Rheumatism, Gout, Gravel, Palpitation of the Heart, Pain in the Side, Back** and **Loins,** they should be continuously taken, as required, to change the diseased action of the system. With such change those complaints disappear.

For **Dropsy** aad **Dropsical Swellings** they should be taken in large and frequent doses to produce the effect of a drastic purge.

For **Suppression** a large dose should be taken as it produces the desired effect by sympnthy.

As a *Dinner Pill*, take one or two *Pills* to promote digestion aad relieve the stomach.

An occasional dose stimulates the stomach and bowels into healthy action, restores the appetite, and invigorates the system. Heace it is often advaatageous where no serious derangement exists. One who feels tolerably well, often finds that a dose of these *Pills* makes him feel decidedly better, from their cleansing and renovating effect on tho digestive apparatus.

TRADE MARK.

New Almaden Vichy Water,
(CALIFORNIA VICHY WATER.)
FROM THE SPRINGS,
NEW ALMADEN,
Santa Clara County.
F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.
OFFICE, 506 JACKSON STREET,
GENERAL DEPOT:
Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of Intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the veinous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases wh re a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be used, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The mansion of that precious water is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constipation and Tenacious Vomiting; Weakness of certain Organs; the Indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhodes; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Scalds its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

Mining Property for Sale.
A Two Thirds Interest
OF THE
Golden Rule Mining Company's
Claims and Mill,
Situated in Tuolumne County, California, two and a half miles south of Jamestown, on the Great Mother Quartz Lode. A good 15-stamp Water Power Quartz Mill is situated on the property, with a never-failing supply of water, as can be shown by the last four years continuel running. This Claim has three parallel Ledges, from 50 to 100 feet apart, averaging from two to six feet in width, with a length of six hundred feet. They are se situated that a tunnel has been run through them at right angles, making a surface drainage of from seventy to eighty feet in depth on the mine. The mine is well ventilated by shafts from the surface, and well timbered as far as worked. In the mine are steam Hoisting Works, capable of hoisting from a depth of 300 feet. A force of thirteen men only are required to keep both mill and mine running regularly.

On the surface and first level for a distance of 500 feet from these veins, the ground or surface was milled by placer miners, in former years, producing from two to five ounces per day to the man, during the season when water could be obtained, which factgoes to prove that a heavy deposit of ore was contained in the croppings of these veins, which, by all former and present theories of deep mine workings, came from below, indicating that when sunk upon to a proper depth, the lead will develop a mine equal to the Amador or Eureka.

This claim has paid its 19th regular dividend of $1,500 each, during the past four years, besides all the construction and other expense account, and has levied no assessments during the same time, and at present has on hand $8,000 in the Treasury, and no debts.

The last level, 150 feet from the surface rock, averaged $7 per ton, on which was a profit of from $4 to $1 50 per ton. The length of the two shutes of ore on the east vein, and the only one worked upon, has been about 200 feet.

Now I propose to sell two thirds of this valuable property for $16,000, cash; and any party who desires to purchase a property of this kind—which theory has proven that irregular depth, on well known shutes of ore, for a sure fortune—can obtain a chance here, providing he or they will go down a sufficient depth. No purchaser is solicited unless he first goes and examine the mine, or sends a mining engineer in whom he can have confidence, to indorse what he may think proper of what has been here stated.

For any further particulars, direct by letter to Wm Bosworth, San Francisco, P. O. Box 1978, or at my office, room No. 5, over Donohoe & Kelly's Bank.
21v18tfqr WM. BOSWORTH.

A Long Desired Article
FOR CLEANING THE HEAD AND HAIR. THE CLEANing of the head and hair has been the subject of consideration for a long time. This object will be accomplished by using
CAMILLE CHAMPOO,
which not only does away with the dandruff, but it cleans the head, strengthens and beautifies the hair, preserves the color, and prevents baldness. It is cooling in nature, and can be used with safety and reliance on the smallest infant. Price 50 cents per bottle. Prepared by EMERTON & LUELLING, 724 Mission street, San Francisco, Cal.
HEATHFIELD & BOGLE, Wholesale Druggists, 206 and 208 Battery street, San Francisco, sole Agents for the Pacific Coast. 24v18-3m

[Continued from First Page.]

being brongbt on, in whicb less feed must be carried, the rake is too great for the feed, and tbe saw will descend one-fourth, and sometimes one-half the stroke before it begins to cut, thns losing that proportion of the cut in each stroke. To obviate this, Anderson's Upper Muley is provided with the long movable slides, F, at the bottom of which are attacbed tbe saw guides, D, which can be raieed or lowered by the hand wheel, chaft and pinion, E, working in the rack on the slides, F.

Programmes of Lectures at the Ecole des Mines.

The *Annales des Mines* publisbes, in 170 octavo pages, the ontline-headinge of the courses of lectnres delivered by the several instructors in the National Mining Scbool of France, a *free* institution of the most ample proportions, and in architecturel grandeur and impressiveness not unworthy of the vast importance, the colosseal moneyed interests attaching to the mineral developments of a great and independent nation.

The Official Director of its studies is M. Gruner, formerly the Principal of the School of Mines at St. Etienne, fifty miles southwest of Lyone, and holding the eame relative position in the coal basin of the Gier as Pottsville in Schnylkill County. Elie de Beaumont, the compeer of Murchison, Lyell and Von Buch, is Professor of Geology; Daubree, of Mineralogy; Callon, of Mining; Couche, of Railroad Construction; Dupnnt, of Mining Law; Delesse, of Drainage; Bayle, of Palæontology. The programmes of the preparatory courses embrace: a. Course of analysis, mechanics, spherical trigonometry. b. Course of descriptive geometry and stereotomy. c. Physics. d. General chemistry. That of special courses: a. Exploitation of mines. b. Metallurgy. c. Docimasy (assaying). d. Mineralogy. e. Palæontology. f. Geology. g. Exploitation of railroads and construction. h. Agriculture, drainage, and irrigation. i. Administrative law, mining legislation and industrial economy.

Combinations in Labor and Capital.

The coal regions of Pennsylvania are prolific of etrikes, the organization of labor including the "whipping in," as moneyed combinations, "corners" and "rings," are the organizations of capital. An artificial check is often songht to be put upon over production or glutting of the market, by combinatione amongst capitalists or merchants; but fortnnately, or unfortunately (?) there is no penalty for the boltere, and the laws of demand and supply do, nevertheless, reign supreme, whether it be labor or capital tbat combines. Certain it is that neither can ever afford to ruu conuter to the interests of the majority, and of the public, for the attempt is sooner or later sure to be paid for by a penalty; and herein lies the difference between intelligent management in organization, and the etupidity "that goeth before a fall."

Hungerford's Concentrator for Tin Ore.

A serious mistake in the figures of Capt. Kelly'e statement on this subject in our last number, was made by our informant, by which 60 per cent. was made to read "6 per ceut."—the amount of metallic tin obtained out nf the Hungerford concentrated ore at Storm & Dwyer's on Tuesday of last week. Capt. Kelly's statement contained facts of considerable importance, from which can he formed some judgment of the cnmparative merits of the Hungerford machine for tin—the most troublesnme ore to concentrate without loss. Out of 3,200 pounds washed, 1,315 pounds were saved—in other words, 41 per cent.; and the resulting concentrated matter was 60 per cent. metal, or within 18 per cent. of the pure oxide of tin, which is 78 per cent. metal, and 22 per cent. oxygen.

CONTINENTAL Life Insurance Compaay, 302 Montgomery street, cnrner of Piae. *

Resources & Developments

FRUIT FOR THE EAST.—Returns received from California fruit eent East hy rail are thus far highly favorable. Tbe fruit appears to stand the trip well, and meets a ready sale at remunerative prices. Of course none but early fruit is sent, which, anticipating tbat of Eastern growth, can be sold at a profit. The latest shipment of which we have heard was a lot of watermelone eent from Sacramento to New York. Contrary to the predictions of most people, the shipment of fruit to the East promises to become a very important business for California. The Central Pacific Railroad Company are bnilding no less than fifty cars to accommodate this business, four of which are already finished. Special, funnel air-pump ventilators are attached to these cars, to insure their best possible condition for fruit transportation.

WOOD BY RAIL.—The question of fnel for the snpply of our growing interior towns is already becoming a matter of serious importance in view of the rapidly diminishing supply of that indispensable article. Virginia City has met tbe qnestion by the construction, for that and other purposes, of a railroad to the Truckee. Other large interior towns will soon have to adopt similar means to obtain their supply at reasonahle rates. The numerous stationary and locomotive engines on this coast, which are already numbered by thousands and rapidly increasing, with all other multifarious usee fnr lumber, are making sad havoc with our forests, which, in this dry climate, are not so readily renewed as tbey are in those countries more favored with rain. Some of the more important points in Colorado are also beginning to feel alarmed at the increasing price of fuel, and are considering the expediency of constrncting railroads to supply their mills, furnaces and private dwellings, and at the same time afford other facilities for transportation, which are more or less needed.

NEW GUANO ISLAND—BAD POLICY.—Some San Francisco capitalists who own a receutly-discovered guano island about 700 miles west of the Sandwich Islands, and who naturally wish to dispose of it to other parties who can immediately turn it to profitable account, are about to sell the same to eome English capitalists. This is bad policy. The time will soon arrive when California will need all the guano within her ready reach to recuperate her land from the exhaustive plan of cultivation now pursued here. Indecd, the time has already arrived when we should commence its extensive use. In Europe, where the principles of hushandry are better understood, or at least better appreciated, tbe value of snch discoveries are fully recognized; hence the movement for the sale referred to. We who are wasting onr rich inheritance would do better to appear as buyers instead of sellers of such valnable deposits—deposits more precious than even the gold that glitters in our mountain sands. By and by, perhaps when it is ton late, we shall become wiser.

AGRICULTURAL RESOURCES.—The westward progress of our agricultural interests affords a most suggestive fact for the contemplation of Californians. Statistics show that tbe territory between the Mississippi and the Pacific, which in 1859 produced but 25,000,000 hushels of wheat, in 1868 yielded 65,000,000. Ten years ago that region yielded but one-seventh of the total product of tbe country; now it yields one-third of the aggregate. In twenty years, California and the States on the immediate eastern slope of the Rocky Mountains will furnisb the great hulk of the cereals for a population of nearly 60,000,000 within our own territory; to say nothing of the millions which will then be dwelling in the islands of the Pacific, on the eastern hordere of Asia, and in Europe, who will look to us for more or less of their breadstuffs.

Company Transactions.

New Incorporations.

Tbe following new companies have been incorporated:

ACCACIA G. & S. M. Co.—White Pine, Nev. June 28th. Capital stock, $720,000; shares, $100 each. Trustees: B. F. Pendleton, S. P. Jewell and R. T. Ward.

MIDIAS M. Co.—White Pine, Nev. Capital stock, $200,000, shares, $20 eacb. Trustees: M. S. Cobb, Paul Sneiler and Fred. Sneiler.

HERCULES G. & S. M. Co.—White Pine, Nev. June 29th. Capital stock, $1,400,000; shares, $100 each. Trustees: F. Vassault, W. J. Maynard, T. G. Durning, W. R. Leveredge and S. H. Brown.

FRESNO QUICKSILVER M. Co.—Fresno County, Cal. July 1st. Capital stock, $4,800,000; shares, $100 each. Trustees: Wm. H. Sharp, A. G. Chauché, Charles Friedberg, L. Castro and E. Pascal.

Meetings, Elections, Etc.

WEST POINT SILVER M. Co.—White Pine, Nev. June 25th. President, G. F. Bragg; Vice President, J. C. Wilmerding; Secretary, Ira Ayres, Jr.; Superintendent, Robert Barton.

NEVADA SMELTING AND REDUCTION Co. June 28th. President, Charles H. Gordon; Vice President, W. Applegarth; Treasurer, Frank Drake; Secretary, David Mitchell.

STATE UNIVERSITY H. A.—June 28th. A. Stebbins (President), V. Smitb (Vice President), Geo. Tait (Treasurer), J. Stratton (Secretary), J. C. De Voy, L. Langstadter and L. Walker.

CITY PARK H. A.—June 29th. Trnstees: I. M. Choguski, H. W. Newbaum, L. Schwartz, D. P. Frank, and L. Feder.

IMPERIAL G. & S. M. Co.—June 29th. Trustees: A. K. P. Harmon, Thomas Sunderland, William Sharon, A. Hayward. J. D. Fry, Thomas Bell and Thomas Sherwood. Superintendent, R. N. Graves.

SILVER SPROUT M. Co.—June 29th. Trnstees: Nathaniel Page (President), E. B. Mott, Jr., A. Wingard, W. N. Wade and A. B. Panl. T. B. Wingard, Secretary and Treasurer.

SILVER VAULT M. Co.—Geo. O. Ecker (President), J. Scott (Vice President), J. L. Homer, J. B. Houghton and J. W. Shaeffer. Joseph L. King, Secretary and Treasurer; and E. W. Herrin, Superintendent.

FRENCH AND MARLBOROUGH M. Cos.—July 1st. Trustees, J. Pinet, E. Thomas, L. Franconi, A. G. Chauché and A. D. Grimwood.

ADDRESS WANTED.—We are desirous of communicating with Allen Oliver, lately of Jamestown, Tuolumne County, California. tf

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enamoled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. HOWLAND.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 21v18-4w

DR. HALL has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Dewilz. Many of the cases in which he held consultation with the above named emtnent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco. 21v18 3m

Cholera—How to Cure It.—At the commencement of the diarrhœa, which always precedes an attack of the cholera, take a teaspoonful of the Pain Killer in sugar and water (hot if convenient), and then bathe freely the stomach and bow ls with the Pain Killer clear. Should the diarrhœa or cramps continue, repeat the dose every fifteen or twenty minutes till the patient is relieved. In extreme cases two or more teaspoonfuls may be given at a dose. The Pain Killer, as an internal remedy, has no equal. In cases of Summer Complaint, Dyspepsia, Dysentery, Asthma, it cures in one night by taking it internally, and bathing with it freely. Its action is like magic when externally applied to Bad Sores, Burns, Scalds, and Sprains. For Toothache, don't fail to try it. In short it is a *Pain Killer.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

THE BEST WEEKLY IN AMERICA.

MOORE'S RURAL NEW YORKER,

The largest, best and cheapest RURAL, LITERARY and FAMILY WEEKLY, in the world, enters upon a new Half Volume July 3, and hence *Now is the Time to Subscribe!* Sixteen five-column pages. Employs the best talent. Finely and profusely illustrated. For example, see the splendid full page group of GEN. GRANT'S FAMOUS HORSES, in No. for July 3d. Adapted to the whole country. Combines Ability, Variety, Taste, Spirit, Progress and Usefulness. Circulates all over the Continent, and now reaches the Pacific States in a week from date. Is not only a superior Literary and Family Paper but treats fully and ably upon Rural and Domestic affairs, Science, Art, etc. Try it, and you will find that "Moore's Rural" is (as both Press and People say), the Best Weekly in America. Only $3 a year—$1.50 for half. Ask your P. M., or address D. D. T. MOORE,

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 17th and 30th of each month that has 30 days.

On the 10th, 18th and 30th of each month that has 31 days.

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 17th falls on Sunday, they will leave on the Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departure of the 17th or 18th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

The following Steamships will be dispatched on dates as given below:

July 9—GOLDEN CITY.....Capt. Wm. F. Lapidge,
Connecting with ALASKA, Capt. Gray.
July 17—MONTANA.....Capt. E. S. Farnsworth,
Connecting with HENRY CHAUNCEY, Capt. Connor.
July 30—COLORADO.....Capt. Wm. H. Parker,
Connecting with ARIZONA, Capt. Maury.

Passengers berthed through. Baggage checked through. One hundred pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets to Liverpool by the "Inman" and "National" Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports, Comosnpy's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship GREAT REPUBLIC, Capt. Cavarly, will be dispatched for YOKOHAMA and HONGKONG on SATURDAY, July 3d, 1869, at noon connecting at YOKOHAMA with the steamer NEW YORK for SHANGHAI. Shippers of freight to China or Japan are requested to mark on each package its destination.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

NEW INVENTIONS.

A New Car Brake.

Recent experiments on the Erie Railroad have demonstrated the utility of a newly applied power for stopping trains, which secures highly satisfactory results as a preventive of accidents.

The compressed air brake places the entire train under the sole control of the engineer, who is able to bring his train to a full stop within a distance of six hundred feet while going at the rate of twenty-five miles an hour.

The element of power is simply pure air, which at the will of the engineer is forced into the cylinders, forming a "cushion," which becomes harder with each revolution, and the retarding force is consequently rapidly multiplied. At the same time, while the power of the engine is exerted to oppose the motion of the train, the air is forced into a special reservoir, and the power applied directly to all the brakes throughout the train, by means of a strong india-rubber tube, passing under the cars and fitted with double valves at the couplings, so that any number of the cars may be detached and switched off without disarranging the air apparatus of the cars remaining attached to the locomotive.

The invention above alluded to is no doubt an important one, but it does not appear to be as effective for stopping the train as Loughridge's self-acting car brake, by which trains traveling at the rate of thirty miles per hour have frequently been stopped within 350 feet, when the brakes are shod with cast iron, and within 250 feet when wooden shoes are used. Loughridge's brake also presents another feature not accomplished by any other brake, viz., the facility with which it can be applied, not only by the engineer, but by any passenger in any car of the train, and is so arranged as to allow the applying of every brake in the train or of each car, independent of all the rest.

AN ACTIVE INVENTOR.—Joseph Dixon of Jersey City, whose death is chronicled, at the age of seventy-one, was the inventor of a machine to cut files; of the photo-lithographic process; of methods of printing in colors, making collodion, and grinding lenses; of the anti-friction metal that has been for a great many years known as "Babbit Metal;" of the process of steel melting in use in this country, etc. He learned the printer's trade, afterward that of wood engraving, then lithography, and afterward studied medicine, and in that connection became interested in chemistry, becoming finally one of the most accomplished and comprehensive chemists in the country. He was a thorough optician, and had scarcely an equal in his knowledge of photography.

IMPROVED LOCOMOTIVE SMOKE STACK.—Mr. J. W. Bowker, of Sacramento, a veteran engineer on the Pacific Railroad, has invented an improved smoke stack for locomotives and other engines, which, according to the Sacramento *Reporter*, has been thoroughly tested and found eminently practicable. It was recently attached to a locomotive of the C. P. R. R., which made a trip to Rocklin, and on which occasion, according to the *Reporter*, three pairs of keen eyes failed either to see one spark escape or catch even a cinder in either eye. It is also said to be a great economizer of fuel. A patent for the invention has been applied for through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

NEW STAMP GUIDE.—Mr. Chas. A. H. Rice, of Gilpin County, Colorado, has invented what he calls a "universal stamp guide," consisting of a cast iron plate with three movable wooden slides which present their concave ends to the stem of the stamp. They are so arranged that they can be moved up, as they wear away and held to their place by a set screw. When the wood is worn out, it can readily be replaced, and being of wood, causes little or no wear upon the stems. The Colorado City *Register*, of June 10th, says that some 800 of these guides had already been bargained for, for use in that vicinity.

The Australian Colonies.

EDS. PRESS:—Of all these Colonies, VICTORIA is, I believe, the smallest, Tasmania only excepted; but it is by far the most important. Its population is larger, richer and more enterprising than any other. We have one main line of railway through the center of the Colony, from the seaboard to its northern boundary—from Melbourne to Echuca. There is now about to be constructed another main line from Melbourne to our northeastern boundary, the first line being 160 miles long, and the latter will be about 180.

Our principal products are gold and wool, although of late years a great deal of land has been used to produce grain, and now the vine is being cultivated to some extent. Factories also are beginning to spring up, and I am happy to say that it appears to me that a very prosperous future lies before us.

You will see by the list of Patents that there is a large proportion of them which have reference to the gold-producing interest, as there is always a field for such inventions here.

Inventions of agricultural implements (we want now a good sheep-shearing machine), methods for preserving meat, making wine, etc., would have a fair chance here.

NEW SOUTH WALES is next in importance to this Colony; but the people are slower and more prejudiced as a rule. They have some good gold fields, but the aggregate is not to be compared with Victoria. A large proportion of the Colony is used for grazing purposes. They have large coal fields, but grow very little corn.

NEW ZEALAND is next in importance. Their principal products are gold and grain (although not a great deal of the latter).

SOUTH AUSTRALIA follows, and is a very large grain-producing Colony, with some first-rate copper mines. They are also the largest wine producers.

QUEENSLAND is a young Colony. So far it has been used principally for grazing purposes, although gold has been found in several places; but the place is new as yet.

TASMANIA is famous, I believe, only for its convict establishment and its healthy climate.

To Rejected Applicants for Patents.

We believe that under the new administration of Commissioner Fisher many new patents will be granted on applications heretofore rejected upon untenable grounds, by less sound and impartial judges than those now in office. Thus, while the chances are lessened for obtaining patents for meritless inventions, the opportunity is increased for applicants to get patents on rejected cases justly entitled to an issue. Inventors on this coast have every facility through our Agency for obtaining just decisions on their inventions, past and present.

DYSPEPTICS, CHOOSE FOR YOURSELVES.—Victims of indigestion, it is for you to say whether you will continue to endure the living death of which you complain, or awake to a new life of health, vigor and enjoyment. The PLANTATION BITTERS will cure you. It is not more certain that darkness will be dissipated by to-morrow's dawn than that the regular use of this potent medicated stimulant will relieve your every pang, and restore your appetite, cheerfulness and strength. Will you remain in the "Slough of Despond," weak, wretched, a prey to indescribable torments, or will you come out of it and join the throng that have already conquered the disorder from which you suffer, with this glorious vegetable antidote? The transition is easy—the means agreeable—the result beyond all peradventure. ***

MAHOGANY LOGS, just received from Costa Rica, can be furnished at low rates by Hohhs, Gilmore & Co., Market street, between Main and Beale streets. ***

THE RIGHT STAMP!—One of our wide-awake California inventors (who has already received two patents through this office) evinces a true winning spirit in the following note:

SAN JOSE, Cal., June 29, 1869.

MESSRS. DEWEY & CO:—A few days ago I received your letter apprising me of the rejection of my case, etc. Well, under the circumstances, I will just say, "*Let 'er rip!*" and I will remember the indefatigable Zack. Taylor's advice to his soldiers—"Pick your flint and try it again." I will have to try and get even on something else. I am satisfied you have done your duty as agents. Yours, J. F. C.

MECHANICAL AND ARCHITECTURAL
Drawing School
— FOR —
APPRENTICES.

MR. FREDERICK HELLERT,

An experienced Draughtsman and Teacher, has opened an Evening School at No. 414 CLAY STREET (same entrance as the Mining and Scientific Press office), where he is giving thorough instructions in DRAWING to apprentices who are inclined to self-improvement. His terms are moderate and within reach of the humblest apprentice; and we are pleased to say that the enterprise is meeting with success.

1v18.tf

Quarterly and Monthly Editions.

At the end of each quarter a large number of our weekly issues for the preceding three months are bound up in book form, which, by special arrangement, are placed upon the ferry boats and various steamers leaving San Francisco and other ports on the Pacific Coast, for free reading by the intelligent traveling public. The Quarterlies are also to be found in the principal libraries, depots, hotels, and free reading rooms of the Coast.

This, in addition to our Monthly Series and large weekly circulation, makes the PRESS the BEST and CHEAPEST general advertising medium throughout the Pacific Coast. The value of advertising in our columns, however, is best determined by those who have tried it, and we respectfully refer to our patrons in that line. No paper in the United States can boast a better class, and no weekly paper on the Pacific Coast receives as large a sum for regular advertising, or has more constant or long-continued customers.

LOOK to your eyes—If you will see C. Muller, 205 Montgomery street, you will doubtless be able to see better. *

New Mining Advertisements.

Daniel Webster Silver Mining Company.—Location of Works: White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of June, 1869, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office.

Any stock upon which said assessment shall remain unpaid on the thirtieth (30th) day of July, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the nineteenth day of August, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.
Office, 418 California street, San Francisco, Cal. jy3

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, Cal.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the tenth day of May, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. shares.	Amount.
Evans, Comer	335	90	$135 00
Bridges, Mary C.	360	12½	18 75
Senter, Riley	45	10	15 00
Clark, T B	375	10	15 00
Clark, T B	386	2 ½	33 75
Long, E M	354	10	15 00
Phillips, Chas C	60	43½	6 55
Vega, F de la	154	11	1e 50
Jardin, Henry	158	5	7 50
Jardin, Henry	304	3	4 50
Jardin, Henry	330	12½	18 75
Jardin, Henry	331	5	7 50
Jardin, Henry	334	15	22 50
Hepburn, James	116	5	7 50
Hepburn, James	158	5	7 50
Hopburn, James	217	10	15 00
Blanding, Louis	237	28	42 00
Cairns, John	249	70	105 00
Bolts, John	256	8	12 00
Bolts, John	381	10	15 00
Hatch, F S	312	8	12 00
Love, R K	275	5	7 50
Love, R K	332	5	7 50
Cutter, R S	366	3½	5 25
Cutler, R S	384	10	15 00
Long, M	385	22 7-16	33 60
Healy, E D	389	10	15 00

And in accordance with law, and an order of the Board of Trustees, made on the tenth (10th) day of May, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., auctioneers, No. 428 Montgomery street, San Francisco, on Wednesday, the fourteenth day of July, 1869, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Mining Notices--Continued.

Gold Hill Tunneling Gold and Silver Mining Company.—Location: Gold Hill, Storey County, State of Nevada.

The Fifth Annual Meeting of the Stockholders of the above named Company, for the election of Trustees to serve for the ensuing year, will be held on SATURDAY, the seventeenth day of July, 1869, at 3½ o'clock P. M., at their office, 414 California street, San Francisco, Cal.

R. WEGENER, Secretary.
Office, 414 California street, San Francisco. je19

Evening Star, No. 1, Silver Mining Company Location of Works: White Pine District, White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of June, 1869, an assessment of ten cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 302 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Saturday, the thirty-first day of July, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twenty-first day of August, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.
Office, Room No. 6, No. 302 Montgomery street, San Francisco, Cal. je28

Notice.—The Annual Meeting of Stockholders of the "Kewance Silver Mining Company," for the election of Trustees and the transaction of any other important business, will be held at the office of the Company, No. 211 California street, on SATURDAY, July 10th, 1869, at 3 o'clock P. M.

EDWARD BARRY, Secretary.
June 10th, 1869. je12

North Star Gold Mining Company.—Location of Works: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of June, 1869, an assessment (No. 1) of twenty dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 10 second floor of No. 402 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Friday, the ninth day of July, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the thirtieth (30th) day of July, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. W. COLBURN, Secretary.
Office, room No. 10 second floor of No. 402 Montgomery street, San Francisco jun5

Silver Wave Mining Company, White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventh day of June, 1869, an assessment of twenty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary at his office, No. 418 California street.

Any stock upon which said assessment shall remain unpaid on the eighth day of July, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the twenty-eighth day of July, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.
Office, No. 418 California street, San Francisco. je12

Willimantic Silver Mining Company. Location of works: White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of May, 1869, an assessment of twenty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, 418 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the nineteenth day of July, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the tenth day of August, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.
Office, 418 California street, San Francisco. je26

Perpetual Motion.

EDITORS PRESS:—Though it is hardly to be supposed that any reader of the PRESS is spending his energy in search of this *ignis fatuus*, yet he may some time meet with one who is still in pursuit of it. Each may have his own way of answering such persons, but can seldom convince or reclaim the really earnest.

I will relate an anecdote of one of them. He was an old man, a good wheelwright, and had spent so much time on this power of motion, that his business left him, his family were in distress, and himself thought to be crazy. When somewhat recovered, his friends exacted from him a promise that he would never more work at his project. He returned to his trade, and was again doing well, but could not give up the notion that he had the grand discovery in his mind. One day he showed me a few wheels and levers, to give me an idea of his plan. He said he was pledged not to work at it himself, but wished some one else could understand and develop his idea.

I soon perceived that he had made that frequent mistake—taken *pressure* for *power*. When told that even if his machine should start, the variation of a hair's breadth in a thousand revolutions, would soon throw parts of it out of adjustment. "Of course," said he, "it must be made almighty accurate." "Yes," was the reply, that is it exactly, "*Almighty accurate!*" But neither you nor I can do that. He resumed work on his buggy, and never again spoke to me about Perpetual Motion. JEIGH ARRH.

TRIAL OF THE AVITOR.—The *Call* of June 29th, says: The aerial navigation machine, of which so much has been said during the past year, and upon which so much labor and thought have been expended, appears to be a perfect success. The working model, thirty feet in length, was tried near San Mateo on Sunday, in the presence of several gentlemen of this city, and worked like a charm. It not only ascended into the air, but while floating there, was readily propelled in any required direction by the machinery. A machine of sufficient capacity to carry eight or ten persons will be completed in six or eight weeks, and with it it is expected that the trip to New York can be made in twenty-four hours' time. The model which worked so satisfactorily on Sunday, will be exhibited at Bay View Park on the Fourth of July. In shape, the Avitor is an oblong cylinder, which is made to float horizontally in the air by being charged with gas. The front end is pointed, and the rear supplied with a rudder, by which the machine is guided. About one-third of the distance from the head to the stern, flats, or wings, are attached, one on each side, to aid in supporting the vessel when in air. Under these flats are eleven propellers, worked by steam, which give the vessel a forward motion. The inventor and builders of the Avitor firmly believe that a speed of one hundred miles per hour can be easily attained, under favorable circumstances.

THE CHEAPEST WAY WILL WIN.—Titusville, Pa., had at one time forty hotels. Teamsters were their chief support. But a revolution came. Teamsters were superseded. The right man stepped forward at the right moment, and spoke the word of common sense—always a danger and a menace to old routine. "Instead of all this clatter and hubbub of wagons and whips and oaths, in carrying loads of barrels over land, why not," said he, "send the oil silently flowing underground, through pipes, like so much Croton water?" The reform was of course opposed—as all such reforms must be at the outset—by the class whose interests were assailed. Mobs of teamsters tore up the pipes, burned the tanks, and threatened the lives of the pipe-layers. This was done repeatedly; but it was striving against fate. In 1865 the system was fairly established, in spite of all opposition, and now almost the entire product of the oil region, amounting to ten thousand barrels a day, flows or is forced through pipes, from the scattered farms, to the railroad centers, and the army of teamsters has disappeared. A great saving in transportation, in whisky, and profanity, has been the result.—*Atlantic Monthly.*

EARTHQUAKE IN NEW JERSEY.—A severe shock of an earthquake was felt in and about Elizabeth, N. J., on the 11th of June.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery to reduce ores, or saving either gold or silver. 13v10q3y-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

GODDARD & CO.
San Francisco, May 1, 1868. 18v16tf

CALIFORNIA BRASS FOUNDRY.

No. 125 First street, opposite Minna,
SAN FRANCISCO.

ALL KINDS of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch.

☞ PRICES MODERATE. ☜

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

The Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, **220** Fremont street,

1v1 San Francisco.

CROSS' COMBINED
Heater & Sediment Collector

This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,

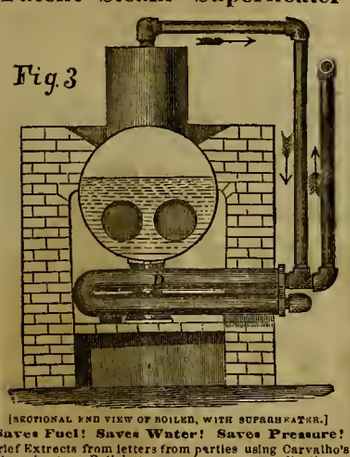
Important to every one using Steam for any purpose.

CARVALHO'S
Patent Steam Superheater



[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1860.

"Superheater saves 12 per cent. in fuel and 10 per cent. more than speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after *seven* years of service.)

"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.

"Superheater saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.

"Superheater saves 20 per cent. of coal, less steam pressure, exhaust more serviceable in drying paper."

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.

"Superheater saves not less than 20 per cent. fuel; no priming!"

CROCKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.

"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y. DYEING & PRINTING ESTAB., Oct 4, 1867.

"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINUOUS OIL REFINING CO., Binghampton, N. Y., Sept. 20, 1867.

"Superheaters give entire satisfaction, and we superheat to 55° deg—an increase of 200 deg."

OAKEW MANUF. CO., So. Hadley Falls, Mass., Oct. 17, '67.

"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867

"Superheater saves at least 25 per cent in fuel, and we have the advantage (cardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867.

"Superheater saves 25 to 30 per cent. in fuel; no priming."

CONTRA COSTA LAUNDRY, Oakland, July, 1868

"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAVILAH M. CO., Cal., August, 1868

"Superheater causes a use of 40 lbs. steam instead of 60 lbs; use much less water, and there is a saving of fuel." (2 acts.)

SIXTH MECHANICS' INST. FAIR, S. F. Sept 4, 1868.

"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.

"Superheater is a perfect success, and saves two cords of wood in eight, or 25 per cent. in fuel; engine works better."

And many other letters of the same tenor.

Awarded Silver Medal, Mechanics' Institute, San Francisco, 1868.

Awarded Silver Medal, Maryland Institute, Baltimore.

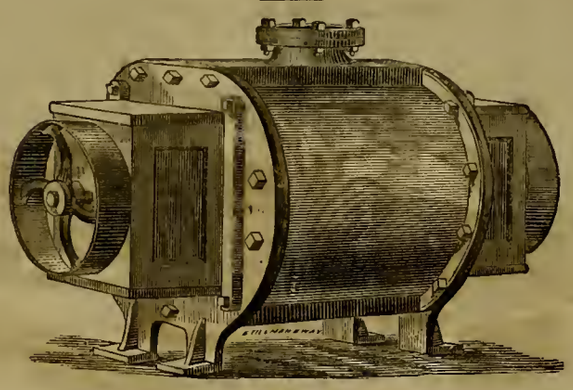
Awarded Silver Medal, American Institute, New York, 1865.

Send for Circular to ÆTNA IRON WORKS, San Francisco, California. ROBT. L. HARRIS, Agent.

JOHN L. CONSTABLE, Engineer. 25v18tf

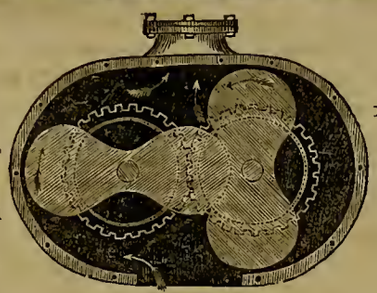
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.
MANUFACTURED BY KEEP & BARGION,
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

—OR—
Wild Cherry Bitters.

TRADE **C. O. D.** MARK.

This elegant preparation is acknowledged by all who have used it to be the most efficient remedy for every disease of the

STOMACH AND BOWELS,

Yet introduced to the notice of the public. Immediately on taking a dose of it, the patient will find a genial glow pervading his entire system, and its steady use for a short time will be followed by a healthy appetite and a good digestion, even in the case of the most confirmed dyspeptic.

To all who are suffering from

INDIGESTION,

DYSPEPSIA,

DYSENTERY,

DIARRHŒA,

NERVOUS AFFECTIONS,

Or any of the manifold troubles caused by a diseased action of the stomach, this remedy is confidently recommended as a safe and certain cure.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

GAS! GAS! GAS!

MACHINES!

THIS MACHINE,

MANUFACTURED BY THE

Boston Union Gas Company,

Is the result of several years of experiment and investigation, until to sum the whole, we can warrant a perfect machine.

It is Simple in its Action

AND THOROUGH IN ITS CONSTRUCTION.

It will last a lifetime; requires not mora than threa minutes's attention a day, to wind up the weight; generates gas jnst as fast as it is wanted, and stops making tha moment you stop nsing it; gives tha

Cheapest, Softest, and Most Diffusive Light

yet discovered. It will maka abundant gas from a cheaper and lower grada of fluid than

ANY OTHER MACHINE IN USE,

and works in cold climates as well as warm. Only those who hava used Gas Machines know what this means. Complete or partial failure in cold weather has destroyed confidence in them mora than all other causes combined.

The Union Gas Machine entirely obviates this difficulty hy a simple contrivance, patented and owned exclusively by this Company, and hy which we warrant each and every Machine to operata successfully in winter or summer in any climate or country. It is tha only Machine that claims to work outdoors in cold climates, and the only one that fulfills tha requirements of the insurance companies without increase of risk. For country residences you save tha breakage of lamps, and your lights are always clean. Away from tha city, a Gas Machine affords one of the most pleasant and valued of city comforts. Of tha advantages of Gas Machines, you pay for no mora Gas than you actually consume. Peopla sometimes imagine they do this with a machina. It is impossibla; and tha same amount of light will not cost one-half the cost of coal gas, besidas being much mora brilliant.

Where the pipe is already in tha building according to the regulations required by the coal gas companies, or where parties wish the entira work of piping fixtures and furnishing, Machine, ate., hy us, wa will do everything and warrant everything.

Tha following card from Mr. Atkinson, 538 Market street, who has been THE FIRST TO INTRODUCE this light in this city, will he read with interest:

SAN FRANCISCO, January 25th, 1869.

MESSRS. D. SIMPSON & Co., Agents of tha Pacific Union Gas Company, 117 Sutter street—Dear Sirs: I hava for the past two months been using the light produced hy tha "BOSTON UNION GAS CO'S GASOMETER," now for sale hy tha PACIFIC UNION GAS COMPANY, and am well satisfied to continue using it. I find that it is equally safe as city gas, more brilliant, and less injurious to the eyes. I formerly paid to tha Gas Company fully 100 PER CENT. MORE than it now costs ma to light my premises. Any persons who may wish to introduce this Light can call at my store, No. 538 Market street, and I will satisfy them as to its economy and merits. JAMES ATKINSON.

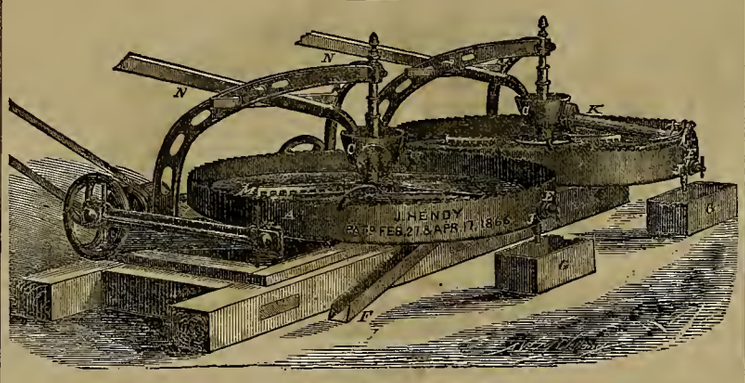
PREMIUM FOR BEST CONCENTRATOR

AWARDED BY THE

MECHANICS' INSTITUTE, 1868,

ALSO AT THE STATE FAIR FOR 1868,

To J. HENDY.



A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.]

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.

JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained ahont 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.

Office at Union Iron Works.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have nniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucibla:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,

Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street—Gentlemen:—We hava used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoronghly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every not obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

CALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred hy all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sala by tha Agents,

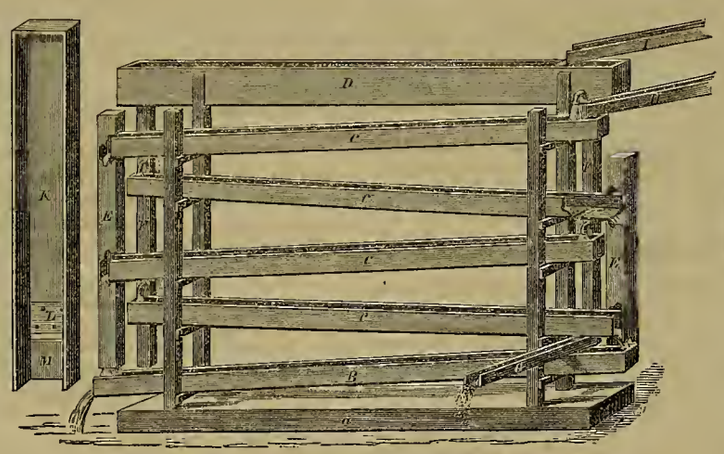
Student Sentiment.

The *College Courant*, a "weekly college and literary journal devoted to college interests, science and literature," published by C. C. Chatfield, New Haven, is received. A glance over its pages convinces one that the *College Courant* represents more than mere students' fancies; it is edited by an experienced and able hand, while the matter embodies as much of student impulses, spirit and buoyancy, as possible. College sentiment, where such sentiment has developed itself, is always significant because most powerful in its influence upon the future of leading men. All who have taken interest in the progress of ideas, will remember how the students of France and Germany have ever been leaders in the battles fought in favor of liberal and noble ideas. The revolutions of '48 and the prevailing national sentiment of the Germans especially had their origin, it is safe to say, in the blood and enthusiasm of the students in the universities of that country. If America has enough of life in its colleges to exhibit sentiment or individuality of any kind whatever amongst the throbbing pulses of students they are training, that circumstance alone is a much better evidence of the substantial usefulness of those institutions to young men who would make the most of life, than all the education that is imparted to them in lectures and classes; for books, with more efficient because practical instruction, are always at the command of young men of *impulse*,—that class of minds that will do the world's work, whether aided by extraneous or general knowledge, and orthodox polish, or not. Minds of this class are more likely than not to appreciate the value of universities and colleges, therefore usually have profited by them in their career; and it is the sentiment of such, that a student's organ should embody, rather than the soulless inanities of staid conservatism, dictated by stranded big-wigs *(zopf!)*—the preachers or professors that never knew what it was to own their own souls on live topics of the day.

FRUIT FOR NEW YORK.—A. Lusk & Co. yesterday received an extensive order from New York for fruit, to be forwarded as soon as possible. California fruit appears to be in demand in the East.

Heslep & Cochrane's Improved Concentrator.

One of the most important operations connected with mining anywhere, and at the same time, perhaps, the most neglected of all, on this coast, is the concentration of ores; hence much interest always attaches to any new invention which may promise to still further aid the miner in this difficult branch of his calling. We this week present our readers with something new in this direction,—a late invention of Messrs. Heslep & Cochrane, of Jamestown, Tuolumne County, Cal. The device is intended to receive the pulp from the mill, after it has passed over and through all the amalgamating apparatus which it may be deemed necessary to employ.



HESLEP & COCHRANE'S IMPROVED CONCENTRATOR.

Referring to the accompanying engraving, K represents the manner of constructing the sluice box employed. L is a metal plate made to slide back and forth so as to enlarge or make smaller, as need may exist, the opening just below the plate, for the discharge of sulphurets, or other heavy matter, while the sand and lighter portion, with the bulk of the water passes on and out at the end of the sluice. The entire bottom of all the boxes may be lined with copper plates, if desired.

Any desired number of boxes, thus constructed, are arranged in a frame-work, as shown at C, C, C, C; D is a reservoir of clean water, to be used as hereinafter described. The pulp is received at the elevated end of the upper box, C, and in passing down drops its sulphurets, amalgamated metals, and other heavy material through the slot shown below L; while the the chief portion of the water and waste is thrown over the slot and into the perpendicular box, E, by which it is conveyed to the waste trough, B.

The sulphurets are discharged into the upper end of the next trough, C, and so on through the entire series, every succeeding trough being arranged and operating precisely like the upper ones.

A stream of fresh water is received from the reservoir, D, through the perpendicular spouts or closed boxes, F, F, at the upper end of each of the series marked C, to take the place of the water which is lost for each box by the partial discharge into the waste boxes, E, E. The sulphurets, mercury and precious metals are finally received in any convenient receptacle placed under the delivery trough, G. The above description is all-sufficient to give a full understanding of the mode of constructing and operating this invention, for which a patent has been granted through the agency connected with this office. One of these machines has been in practical operation at Mr. Heslep's mine at Jamestown, where it is said to give most extraordinary results.

To Wash Fleece Wool.

The *Scientific American* has an article upon this subject, by Dr. Reimann, a portion of which we condense: The present practice of washing wool with decomposing urine, objectionable in many respects, is kept up by manufacturers because, as it would seem, they are not acquainted with Schlieper's process, discovered 20 years ago. This chemist was, in 1843, superintendent of an American carpet factory. He instituted experiments to supply the want of a suitable washing mixture for the wool. After many efforts, he finally prepared the following,—which well serves the purpose of cleansing the wool, without injuring it: Powdered carbonate of soda, 20 parts; powdered hydrochlorate of ammonia, 9 or 10 parts; olein, 9 parts. The amount of hydrochlorate of ammonia is dependent on the quality of the wool. The finer the quality, the greater the amount required.

From the mixture of carbonate of soda and hydrochlorate of ammonia carbonate of ammonia results. The soda of the carbonate is transformed into common salt (chloride of sodium). The olein combines with a portion of the soda, and is converted into oleate of soda or soda soap, and a corresponding amount of bicarbonate of soda is formed. The bicarbonate of soda serves with the bicarbonate of ammonia to prevent the carbonate of soda from exerting any injurious influence upon the wool. In this operation the olein facilitates the production of an emulsion with the fat of the wool. Herr Schlieper always found that the washing was incomplete without olein. The temperature employed in washing is of considerable importance. It depends upon the quality of the wool and the quantity of hydrochlorate of ammonia employed. It can only be found out by practice. Even slight elevations of temperature have very considerable influence in the process of washing. For instance, the wool bears well a temperature of 122° Fah., but is altered at 129° Fah. Another kind of wool withstands a temperature of 115° Fah., but is damaged at 122° Fah., and so on.

State University.

At a meeting of the Board of Regents, held on Tuesday, July 6th, Paul Pioda, of Santa Cruz, was elected as Professor of Modern Languages; Ezra S. Carr, formerly of the University of Wisconsin, was elected as Professor of Agricultural Chemistry and Horticulture; and Wm. Swinton, well known as a former correspondent of the New York *Times*, was elected Professor of Literature, Rhetoric and Logic. The Professorship of Mathematics will be acted upon at the next meeting.

It has been determined that the University shall be opened immediately,—this fall,—in the buildings of the present Oakland College. Though operations are going forward in the improvement of the Berkeley grounds, no plans for building are yet commenced being carried out. As soon as the same are decided upon, there will be a representation in the MINING AND SCIENTIFIC PRESS. The University prospectus recommended by the Committee on Instruction, is about to be published.

THE HOWLAND BATTERY—METROPOLITAN MILL CO.—A gentleman engaged in running a Howland's improved eight-stamp battery at the Kohler mill, writes that the mill, together with four Wheeler pans, are being run in a satisfactory manner with a seven-inch bore and ten-inch stroke Hoadley portable engine. The mill is doing good work.

The same writer adds that the Metropolitan mill commenced operations this week on their own rock. This is a new mill, with 900-pound stamps and Hepburn pans. The company's ledge is found to be about forty feet in thickness, much of which, it is supposed, will work as high as $80 per ton. The Metropolitan is owned by parties in this city, and is under the superintendence of Mr. Johnson, a practical and prudent millman.

A SPRIGHTLY letter from "R. G." of Treasure City, has reached us through Mr. Murray's hands, the facts of which had, unfortunately for the communication, all been published previously.

MANY FLOCKS.—There are said to be 100,000 sheep in San Luis Obispo County.

Communications.

White Pine Correspondence.

[Written for the Mining and Scientific Press.]

Ens. Press:—Now tbat the money market is getting a little casier in the Bay City, and the mills bave bad an opportunity to ship convincing proofs of the presence of the precious metals in tbis district in the shape of bricks, a few items in regard to the developments in the mines must be read in San Francisco witb renewed interest. A great majority of the producing properties are already owned in your city, as well as a large minority of the non-prodncing and "untamed feline article." The Press has a very respectable circulation in this vicinity, and is received bere as a standard of the mining business of the Pacific Coast.

The history of the Wbite Pine mines has been pretty thorougbly placed before your readers, with its lights and shadows. Trickery bas been resorted to, and many ewindles perpetrated; but most of these have been effected where parties were themselves at fault. People who buy mines because they are offered at a small figure, ebonld expsct to get the worst of the bargain, and generally do; while those who have examined before pnrchasing, and then paid a fair price, have, in nearly evcry instance, secured a ricb and permanent property. This is the case with the Virginia, Mammoth, Charter Oak, Pocotillo, Aurora North and South, Icebsrg, California, Copper Glance, Banner State, Comstock, Metropolitan, Pogonip, Otbello, Snowdrop, Consolidated Chloride Flat, and hundreds of otber mines which to-day rank on account of development as second class mines only on account of the slight amount of work which has been done npon them. There are now a few over 10,000 locations on record in the district; and it is eafe to say tbat nearly one-third of these will, by priority of another location on the eame vein or deposit, or from the fact of the location having been made where neither vein or deposit existed, eventually be abandoncd. Of the other two-thirds, more than three-fonrths will prove paying properties if managed fairly.

It is already demonstrated beyond a donbt that the district at large is a success; that the mines are legitimate paying mines. The Eberhardt has made its owners wealthy, and—telegrams and croakers to the contrary notwithstanding—has to-day as much and as rich ore iu eight as has been extracted. Tbe Pogonip and Othello will, by the time the company's mill is ready for operation, have at least eix months' supply of ore on their dumps. They are now raising about ten tons daily, which will produce between $200 and $300 per ton, and could, if necessary, put even now *one hundred men at work on pay ore.* Tbe Virginia, under the supervision of Geo. H. Willard, is turning out rich ore in qnantity. Pocotillo is fast proving itself a first-class mine, and before fall will stand eecond to few in tbe district. The Mazeppa has passed through a strata of low-grade ore, aud is again extracting very rich chloride. Work has been started again on the Rattler, and fine ore the consequence. Both of the companies on the Aurora are taking ont large quantities of ore, which produces about $100 per ton. The Post Hole Co. (lessees of the Snowdrop Soutb) extract about ten tons daily, whicb produces about $175 per ton.

The mills now in operation are overrun with ore, and the mines which are eituated off the road have no chance whatever. The tesmsters findiog tbose which are accessible easily can supply the mills, report for tbeir own benefit that fact to all wbo have inaccessible property; and the millmen state that they are of course ready to reduce any and all ore, but have just now contracted for all tbey can handle for the next three months. Most of the ore being reduced costs the owners at the rate of $50 per ton, and they receive but 80 per ceot. of the pulp assay at that. Forty dollars per ton and 87 per cent. of the pulp assay would be a fair figure this fall, and be doing justice to both parties. Then, after we have plenty of mills and their machinery in good order, ore can and no doubt will he reduced at $25, and possibly $20 per ton. When large lots are sent to the mill, by obtaining a clean-np, or, in other words, the bullion, instead of settling by tho assay of the pulp, even a slight advance in the returns may be procured. Tbere are now 128 stamps in operation; but from the various faults in tbe machinery they scarcely average one ton per stamp per day. New discoveries continue to bs msde almost daily, and ore worth thousands per ton (by assay) in new places found.

Bullion Hill, about three miles west of Hamiltou, has quite a number of mines, which will be famous as the Eberhardt itself duriug the coming month. Tbe latest spot is some three miles southwest of Shermautown. This was discovered to be rich only a few days since, and even now but few are posted on it. Several locations have been made there, and in a few days it will be more generally known, and a local excitement will follow. Rich ore is also being found on the west slope of the Base range, nesr the original discoveries, and, in fact, the people here are so excitsd over the piles of rich chloride that they are fast coming to believe tbat the rich belt is of the full size of the district; and as ore assaying in the thousands is found at all points, I don't pretend to say that tbey are all wrong. And, apparently, tbe belt extends across the valley west to Pinto, and tbence to Eureka district. In conversation with an experienced prospector just in from the mountains, a few days since, I was somewbat surprised to hear bim say this belt ran even tbrough the Cortez and Battle Mountain Districts, and he could trace it all tbe way. The tbeory of metsl running in alternate belts is not new, yet it bas never, in this State at least, bsen proven.

Tbe emigration this year will tend to fill ths entire eastern portion of Nevada with prospectors; and within five years the whole country will be examined. Then geology can be studied on a grand scale.

Tbe outside districts find it very hard to procure laborers, as all seem bound to stick to Treasnre Hill, if they starve in the attempt. The Lane & Fuller Co., of Austin, have lately employed men here and paid their passage to Austin, being unable to procure men nearer. They have leased the Metacom mill, witb the privilege of purchasing if their mine proves itself capable of supplying it with ore.

The bullion shipment of White Pine equals Austin, or rather Reese River, in its best days, even now, and will double it this fall.

We sball ship nearly $300,000 for June, and steadily advance for at least a year, when a further advance must depeud on deep work.

The election for District Recorder takes place on the 20th of July, and parties in San Francisco should interest themselves in the matter. Tbere are at present ten candidates in the field, among them W. P. Tenney, the present incumbent. Mr. Tenney has made a good custodian; the record books have been faithfully cared for, and tbe workmanship is indeed elegant. A safe has been procured for their protection, and a fine and convenient office erected, while deputies are kept constantly in the outskirts to accommodate all. Again, Teuney is personally acquainted with more locations than any other man among us. Confusion in the records would create litigation without end, and can scarcely be avoided nnder a new administration. It behooves all having interests of value here to attend, if possible, aud see that be is retained another year, when things will be more settled and better understood.

G. B. E.

Treasure City, Nev., June 28, 1869.

What Kind of Mines to Depend Upon.—Paradoxical as it may appear, the richest mines are the least, and tbe poorest mines tbe most profitable. North of Nevada there is but one "poor man's mine." Tbat yielded several thousand dollars per ton at first. Now, if worked at all, it yields moderately. In all Nevada there is but one White Pine District, and even there, and possibly at one other locality, only a few mioes yield $1,000 per ton.

During the past nine years the great Comstock mine of Nevada has produced $100,000,000, its ores averaging about $40 per ton. The Haywood mioe in California, has yielded $3,000,000, yet its ores average only $20 per ton. The very rich ore is apt to be found in pockets. But a low grade of ore of $20 to $40 per ton for gold, and from $50 to $200 per ton for silver, is more likely to be found in a regular, well-defined mioe in inexhaustible quantities.—*A "Well Burnt but finally successful Miner," in Appleton's Journal.*

Familiar Science.

Cause of Color in Animals.

The canse of tbe varisty of color on the skins of animals, and on the wings and bodies of insects, as on bntterflies, has long been a matter of much speculation, and of no little close study. It has been variously attributed to temperature; to an afflux of blood, occasioned by the physiological action of certain organs situated near the teguments, and to the influence of electricity.

Dr. Nicholss Wagner, of Paris, some two or three years since, entered upon an elaborate series of experiments to determine wbether or not electricity might have an influence in this direction. The insect world appearing to him the best calculated to solve the question, he selected a member of the butterfly family *(vanessa urticæ)* as a subject for his expsriments, in tbe course of wbich he satisfactorily determined that strong elements disorganized, first the pigments, next the scales, and tben the membrane itself. Weak currents simply changed tbe colors, transposing red into orange and black into red. A still weaker current, on the contrary, *gave rise* to black spots, and always nearest to the very places wbere such spots natnrally exist on the wings of the *vanessa.* In some cases slight changes were effected in tbe *shape* of *existing* spots; and in all such it was observed that tbe change of form followed the direction of the electric current. Rumkorff's machine was employed for intermittent induction currents; while for constant currents he employed two or three of Grove's elements. It was hence inferred that, at least in tbst class of insects, electricity acts as an irritating agent in the production of the variety of their color. Another series of experiments demonstrated the fact that fixed currents of electricity exist in the wings themselves of these insects. The strongest of these currents flow from the base of tbe wing to the outer margin, following the middle nervure; and other currents, starting from the same point, cross each other—the colors evidently being modified by the action of these variously modified currents.

Salt in Cooking Vegetables.—If one portion of a dish of vegetables he boiled in pure water, and the other in water to which a little salt has been added, a decided difference may be observed in tbe tenderness, flavor, and, if potatoes, mealiness of the two. Onions are probably more improved by being cooked in ealt water than any otber vegetable. Much of their unpleasant emell is taken away, and a peculiar sweetness and improved aroma is decidedly apparent. Salt hinders the evaporation of tbe soluble and flavoring priuciples of vegetables.

How to Breathe.

The action of respiration should never be carried on through the mouth. "God breathed into man's *nostrils* the breath of life." The correctness of the inspired writer of old is fully sustained by modern philosophy and physiology. The miechievous habit of carrying on the action of respiration through the mouth instead of through the nose, is the real origin of almost all the diseases of the throat and lungs, and even consumption itself. Medical writers tell us that the excessive perspiration to which some are liable in their sleep, and which is so weakening to the system, is mainly the result of sleeping with tbe mouth open. Whether you walk, sit, read, write or sleep, keep your mouth closed, except when engaged in conversatiou or necessary vocal reading.

Tbe pbilosophy is this: The velocity of the blood through the body, and the heat of the body itself, depends maiuly upon the quantity of atmospheric sir taken into the lungs. Nature measnres that quantity by the nostrils, not by tbe montb. When the mouth is employed tbe measure is too great; bnt just sufficient when the nostrils are used. An excess of air overheats the body, while its passage through the mouth otherwise injuriously affects the throat. The habits of children, in this respect, should be carefully watched and regulated. Open mouths prodnce a vacant and nnseemly appearance, and may bs regarded as very sure precnrsore of habitual colds and sore throats.

Clothing and Health.

Many lives are lost every year by an injudicious use, or rather change of clotbing. It is always safe to put on additional clothing; but the greatest care should be taken in reducing it—either for the sesson or for the day. Tbe nse of flannel shonld become more general and more persistent. It is safe, nay, it would be beneficial to the bealth of every person to wear flannel nnderclothing, the year round—of course nsing thinner material in snmmsr. It should be changed often, bowever, especially in summer. No doubt scores, if not hnndreds of lives are lost every year in this city by sitting in cold rooms morning and evening. Fires ehould be more generally used here. Health is always endangered when chilliness comes over the system. Children are thereby exposed to the croup and other kinds of illness, and old people to inflammation of tbe lungs. Hall's *Journal of Health,* in allndiog to this subject, says:

The old and the young delight in warmth; it is to them the greatest luxury. Half the diseases of humanity would be swept from existence if tbe human body were kept comfortably warm all the time. The discomfort of cold feet, or of a chilly room, many have experienced to their sorrow; they make the mind peevish and fretful, while they expose the body to colds and inflammations which often destroy it in less than a week.

Children's Arms and Legs.—A distinguished physician, who died some years since in Paris, declared: "I believe that during the twenty years that I have practiced my profession in this city, twenty thousand children have been carried to the cemeteries, a sacrifice to the absurd custom of exposing their arms naked." On thie the editor of tbe Pbiladelphia *Medical and Surgical Reporter* remarks:

"Pnt tbe bulb of a thermometer in a baby'e mouth, the mercury riees to ninety degrees. Now carry the same to its little hand; if the arm be bare and the evening cool, the mercury will sink to fifty degrees. Of course all the blood tbat flows through these arms must fall from ten to forty degrees below the temperature of the heart. Need I say when these currents of blood flow back into the chest the child's vitality must be more or less compromised? Aod need I add that we ought not to be eurprised at its frequent recurrent affections of the tongne, throat or etomach? I bave seen more tban one cbild witb habifual cough and hoarseness, choking with mucus, entirely and permaocntly relieved by simply keepiog the hands and arms warm. Every observing and progressive physician hae daily opportunities of witnessing tho same cure."

Poisoning by Adulterated Tin Foil. Tbe tin foil in wbich so many articles in common use are wrapped, is made by inclosing an ingot of lead between two of tin, and rolling them together into foil. The outer layers often become broken; and then the full effect of the poisonous lead is exercised upon sucb articles as will act npon it. Tobacco, cheese, smoked meat, dried fruits and pickles, are such articles, and are often brougbt in contact with it in the packiug. The *Journal of Applied Chemistry* says that the nervous twitching of the muscles of the face, which is noticeable in some tobacco-chewers, is undoubtedly due to paralysis caused by lead poisoning. The butyric acid resulting from the butter contained in cheese, makes a poisonous salt with lead; and the acid of fruits, as it ie perhaps unnecessary to eay, will do the same. A reform in this matter of packing in tin foil is to be desired.

Mechanical Progress.

The Wood Screw Manufacture.

A single Birmingham firm produces rather more than a thousand million wood screws yearly—or, say, 150,000 gross weekly. This firm, as also M. Japy, who has large screw-making works in France, "use,"—saye *Engineering*,—"the remarkably ingenious machinery invented by T. J. Sloan, of New York." The works of the Birmiaghaai firm employ a thousand people. To convey an idea of the extent of the business, and at the same time give an interesting mechanical item, we quote the following from the journal above named:

"The cutting of the slot in the head of the screw is effected by circular saws, of which Messrs. Nettlefold and Chamberlain use and wear ont 150 gross, or upwards of 20,000 saws weekly, each saw cutting the slots in about 1,000 screws. These saws, of from 90 to 100 teeth, and of but 3 in. in diameter, cost M. Japy, the French manufacturer, about 7d. each. Mr. Batho, who was for some years the engineering brain of Nettlefold's screw factory, contrived a plan of making these saws at a cost of about ½d. each. He placed 144 (a gross) of thia circular plates, 3 in. in diameter, upon a mandril, and subjected them, as if they were a single piece of metal, to the action of a series of slotting tools. For saws of 100 teeth he at first employed 10 cutters, thus finishing the saws, 144 at a time, by 10 complete cuts. He afterwards employed cutting tools adapted to form three teeth, each at a single cut, so that, for 90-tooth saws, but three changes of feed were necessary, 30 teeth being cut, by ten tools, at each adjustment. The line of cut, instead of being parallel with the axis of the mandril to which the saws were fitted, required to be spiral or twisted, to give the proper cutting angle to each tooth of the saws. This was effected by giving to the group of saws the slight necessary axial rotation during the cut, which would correspond to the requisite angle of the cutting edgee of the saws. It is something to save 20,000 sixpences, or 500*l*. a week, in the mere matter of sawe for cutting the slots in screw heads."

Electro-maonetic Safety-Lamp.—One cause of the frequent coal mine explosions is the recklessness of the miners, who will often open their safety-lamps in order to light their pipes. Locks, the keys of which are kept by the foreman, have failed to meet the case; for they are often picked by the very men for whose safety they are contrived. An English inventor has just patented a lamp which is not open to this objection. It is described and illustrated by the London *Mining Journal*. The bottom screws on; and when quite home to its place, a steel pin springs up and fastens it there. Thie pin is within the lamp, and cannot be seen or reached. It can he withdrawn only hy a powerful magnet applied outside; one more powerful than any that can be carried in the pocket. An electro-magnet is used. This magnet with its battery is fixed in the lamp cabin, is constantly ready for use, and is under the charge of the foreman. The oil lamps, of various kinds, can easily be altered to this.

Boiler Joints.—W. M. Henderson saye: Riveted joints exposed to a tensile strain, are directly, or nearly so, as their respective areas, or in other words the collective areas of the rivets should be equal to the collective areas of the plate, taken through the line of rivets.

The proportioual size of rivets, pitch of ditto, and lap of joint, will he as follows: Diameter of rivets for plates up to three-eighths is twice the thickness of plate. The pitch for three-sixteenth and one-quarter inch plates is six times the thickness of plate; for five-sixteenth and three-eighth inch plates it is five times. The lap for three-sixteenth, one-fourth, and five-sixteenth inch plates should he six times the thickness of plate, and for three-eighth plates five and a half times. For douhle riveting, add two-thirds of the depth of the single lap. Diameter of half-round heads oue-fifteenth for one-eighth of diameter of rivet. Diameter of conic heade twice the diameter of rivet, and the hight of both description of heads, three-fourth diameter of rivet.

Galvanic Deposition of Nickel.—It was for a long time practically impossihle to deposit nickel in more thau a mere film. This thin deposit would then become oxidized, and worthless. Dr. Adams of Boston has succeeded in obtaiaing deposits an eighth of an inch in thickness. He does this by modifying the character of the solution. The *Artisan* gives a hrief discusseion which took place at a meeting of the Polytechnic Association of the American Institute upou the different conditione under which tho electro-deposition of different metals takes place. It was remarked that the experimentation which had been gone through with upon nickel, would probahly he of value in similar researches with rogard to eueh metals as iridium, etc. A nickel electrotypo plate wonld bo practically incorrodihle, and much harder than copper, and consequently far superior to it.

Smooth Pulleys and Smooth Belts.—Mr. James Christie sends the result of his experience to the *Journal of the Franklin Institute*, from which we quote:

"In order to ohtain the full value of a belt, it is first necessary that it should he in thorough contact with the pulleys. A new helt will bo found touching in spots, and will not pull well; any unguent on the helt will be found of immediate henefit, as it softens its eurface, and hrings it in complete contact with the face of pulley. The hair side, on account of its emoothness and closeness of textnre, seems to conform to this coudition sooner than the flesh eide, which is open in texture and rough on the surface. But after the helt is once worn to the proper condition, I doubt if there ie any appreciable difference in the two sides, in value. In fact, with *well-worn* helts, which have been used alternately with each side to pulley, it is often difficult to distinguish the hair side from the flesh side. By *well worn* I do not mean *injured by use*, but simply that condition of helt in which the color of the eides is rendered uniform hy absorption of oil, and in which the surface gloss and texture is made nearly uniform by contact with pulleys. Iatimate contact hetween helts and pulleys is undonbtedly necessary. The utility of emooth faces to pulleys is also well estahlished."

Cornish Pumping Engines.—H. P. Birkinhine, engineer, writes thus of these engiues: "The exhaustive works of Wicksteed & Pole fully describe the construction and operation of these engines, and demonstrate theoretically, and hy the actual working of engines in operation, that there is no other form which gives as high duty; that is, raises as much water with a given amount of coal. An experience of nearly seven years as chief engineer of the Philadelphia Water Works, and an extensive connectiou with other water works, has satisfied the writer that where any considerable amount of water is to be raised the Cornish engine is not only the most economical in all iteme of running expenses, but also the most reliahle, and that no other form of engine should he recommended."

New Steam Ice Machine.—Dr. Van der Weyde, of New York, has recently,—saye the *Artisan*,—patentsd a freezing machine in which, hy the consumption of one ton of coal to operate a small steam engine, a degree of cooling may be produced equal to that obtainable from fourteen tons of ice. The liquid hy which its evaporation produces the cold, is a very volatile gasoline, and is obtained from petroleum. It costs about twenty cents a gallon, and may be used over and over again. The cost of producing ice by this means will be $2 per ton; or, one-tenth of one cent per pound.

Black Walnut Polish.—We find the following in the *Chemical News:* Pour over pulverized asphaltnm twice ite bulk of turpentine, put it in a warm place, and ehake it from time to time. When dissolved, strain it, and apply it to the wood with a cloth or stiff brush. If it ehould make too dark a stain, thin it with turpentine or benzole. This will dry in a few hours.

Spherioal Safety-valve.—In a directly loaded safety-valve introduced hy Mr. Nasymth, the valve is a sphere, and has a load hung to it *inside the boiler*. Mr. Fairbairn loads the safety-valve by a weight and lever inside tho boiler.

Scientific Progress.

Deep Sea Sounding—The Bathometer.

It has been pronounced impossihle to souad the greatest depths of the ocean with a lead and liue. Soundiag is uncertain even in moderate depths, owing to undercurrents, and to the drifting of the operator'e hoat. But au ingenious arrangement has recently been patented hy Sidney E. Morse, the geographer, and former editor of the *New York Observer*, associated with his eou Livingston Morse,—hy which all difficulties aro obviated, and the deepest soundiags ohtaiued with the greatest accuracy. It is called the "bathometer," or "depth-measurer." It was exhihited at a recent meeting of tho Association for the Advancement of Science and Art, in New York. It consiets of a hollow cylinder of wood or tia, six inches in diameter, and of any desired length, containing a number of hollow glass epheres filled with air, which, hy their huoyancy are to bring the apparatus hack to the eurface after its descent to the bottom. The cylinder is so ballasted that it will take an upright position in the water. A weight is attached, which releases itself at the touch npon the bottom, allowiag the cylinder to rise. This it does with the same rapidity with which it sinks; and as that has heen determined by previous experiment, the time which passes during its disappearance, after heing thrown overboard, serves to indicate the depth to which it has descended. Moreover, there is attached to the cylinder a glass vial containing distilled water, and having its neck inverted iato a rubber bag filled with mercury; a connection between the hag and vial heing secured by means of a thermometer tube passiag through the india-ruhher stopper of the vial. The pressure upon the bag at different depths, causes a greater or less quantity of the mercury to make its way through the tube into the vial, compressing the distilled water to a proportionate extent. This quautity of mercury is another index of the depth reached; and it is measured hy inverting the vial, and thereby causing the mercury to flow into a graduated tube which is attached to it near the neck. A third mode of measurement, which may be employed as corroborative of these two, is tho attachment to the machine of some one of the different self-registering instruments which are in use to indicate the distance passed through.

The *Tribune* says of this apparatus: "The advantages claimed for this instrument in addition to its much greater reliability, are great economy of time and convenience of using. By the old method, from six to seven houre were required to ohtain a sounding of 2,000 fathoms, while the Messrs. Morse estimate, from experiments which they have made, that their instrument will sink to that depth and return to the surface within thirty minutes. Nor is it even necessary for the operator to wait at all for the reappearance of the instrument, as the indications once made remain undisturbed; and in case of stormy weather the machine might he left to float about until a more convenient season, or to he picked up by some other vessel."

The *Scientific American* says: "In a recent experiment the instrument rose from the bottom at the rate of twenty feet a second, or of a mile in less than four minutes and a half. They helieve that a sounding in 2,000 fathoms water will ultimately be made easily in less than fifteen minutes. The time occupied in a sounding of this depth hy those employed by the United States Government in sounding hetween Ireland and Newfouudland, preparatory to laying the Atlantic cable, was ordinarily six or seven hours."

Museum Pest.—It is eaid that crystals of carholic acid, placed here and there in cabinets, will, by their evaporation, kill all insects that might destroy entomological specimens or others belonging to natural history collections.

The Zirconia Light.

Our readers will remsmhsr the announcement which was made some three or four months since, to the effect that zirconia would uadoubtedly take tho place of lime, ia the production of light under the oxy-hydrogen flame. It was then asserted that it uot only did not crumhle and waste, like lime, either when iu or ont of nse, but that it gavo more light under given circumstances. But for eome reason the French inventors failed to briag their lamps before the English puhlic. The Paris correspondent of a London jonrnal, recently sent the editor one of them, with a euggestion that he test its power. The light was *much less brilliant* than that with lime, under the same conditions, as to the size of the fragment used, and its distance from the jet. Nor did any of the many variations made in these conditioue by the experimenters, alter the result. *The Engineer* of June 4th, after describing the experiments, says:

These conclusions do not in any way affect the question of the permanency of zirconia under the fierce heat of the oxyhydrogen flame; but such permanency, if purchased at the expense of inferior light, is too dearly hought, aad will condemn the invention. Unless the inventors are acquainted with eome peculiarities of zirconia unknown to those who are versed in the use of the lime light, and can by an unknown method bring out a light from the zirconia equal to that given by lime, the zirconia light, from an economical point of view, ie a failure.

Reduction of Silver.—Dr. Grager euggests,—says Prof. Joy,—a modification of the old method of redueing chloride of silver by metallic zinc, that ought to he more generally known. The chloride is dissolved in ammonia, and poured into a well stopped hottle, into which metallic zinc in fragments is introduced. The bottle is well ehaken at intervals. Three hours will euffice to reduce one-quarter pound of ohloride. The solution is occasionally tested with hydrochloric acid, and when no cloudiness results, the reduction is completed. The silver is then washed with water as long as any odor of ammoaia is perceptible. The zinc fragments are removed hy pouring the contents of the bottle through a funnel, the opening of which is too narrow for the passage of the fragments.

The Aurora.—We extract the following from a recent article hy Professor Loomis: Auroral exhibitions take place in the upper regions of the atmosphere, siuce they partake of the earth's rotation. Whenever an auroral corona is formed, it maintains sensibly the same position in the heavens during the whole period of its continuance, although tho stars meanwhile revolve at the rate of 15 degrees per hour. At the hight of a little over four miles, the density of the air is only one-half what it is at the earth's surface. The phenomena of shooting stars indicate an atmosphere at the hight of 200 or 300 miles, while the aurora indicates that the atmosphere does uot entirely cease at tho hight of 500 miles. Auroral exhibitions take place, therefore, in an atmosphere of extreme rarity; so rare indeed that if, in experiments with an air pump, we could exhaust the air as completely, we ehould say that we had obtaiued a perfect vacuum.

Tho auroral beams are simply spaces which are illumined hy the flow of electricity through the upper regions of the atmosphere. During the auroras of 1859 these beams were nearly 500 miles in length, and their lower extremities were elevated about 45 miles above the earth's eurface. Their tops inclined toward the South, about 17 degrees in the neighborhood of New York, this heing the position which the dipping needle there assumes.

Proposed Change of Equivalent.—M. Rabache says that if chemists would adopt four as the equivalent of hydrogen instead of one, it would cause the fractions of equivalents 0.5, 0.25—which occur rather frequently,—to disappear; moreover, it would enable us to considor this new equivalent as representing four atoms placed at the summit of a regular tetrahedron.

Farming and Gardening.

Indigenous Cereals and Grasses of California.

Much has been said of the wonderful display of indigenous florals in California, indeed this State has been called the paradise of botanists. But California is still more remarkable for its native cereals, and other valuable grasses. If the entire catalogue of native cereals were to be swept from the face of the earth, California alone would be able, in a few years, to produce from her native grasses every variety of wheat, barley, oats, rice, millet, etc., which now constitutes such a large proportion of the food of the human family, and of laboring animals.

The wild oats which cover thousands of miles of our territory are admitted by botanists to be pure, unadulturated natives of the soil, and not the result of the deterioration of the cultivated grain of early settlers. The early Spanish explorers, more than 300 years ago, found native wheat growing along various portions of the sea coast. Prospecting miners have frequently, of late years, reported indigenous wheat along the central places of the western slope of the Sierra Nevada; and native rye and barley are also frequently met with in the same localities. We have seen it stated that the rye has been cultivated, and samples of same taken to the East. This grain the editor of the *Prairie Farmer*, to whom it was shown, pronounced "a very excellent variety of white rye, with a long, plump berry, of a beautifully clear color, making, it is said, a very superior flavor." Indigenous rice and millet are found plentifully in the Tulare swamps, and in other localities. Beans, pumpkins, cotton and maize were cultivated by the Indians of the southern portion of the State, when the early missionaries and other adventurers visited that region as long ago as 1541.

Native varieties of flax, hemp and tobacco, as well as a very superior species of wild sugar-cane, have been known to the Indians in this State from time immemorial. Such facts as these were received with much incredulity a few years ago; but now, we believe, they are nowhere disputed.

Some two or three years since the Stockton *Republican* noticed, substantially as follows, the discovery in that vicinity, of what appeared to be something quite new in the line of cereals: The ear or cluster of grains, formed on the summit of the stalk, was about 3½ inches in length and four in circumference; the grains, several hundred in number, were about the size of the seed of broom corn; but harder than wheat and undistinguishable in taste from maize. The weight of a single head was equal to some fifteen or twenty well-formed heads of wheat, and evidently grew upon a stalk larger and stronger than wheat; but smaller and less fragile than corn. It would doubtless prove of interest to learn whether any attempts have been made to improve and develop this cereal by cultivation.

Native Grasses.

Some fifteen years ago, in the early days of Grass Valley, Dr. Cleveland, of that place, furnished the *Telegraph*, with which paper the writer of this was then connected, the following information with regard to the indigenous grasses then found on a single ranch in that town:

There are ten distinct varieties of grasses, all of which, save one, (blue grass, brought from Missouri in '50,) were taken from the ranch of J. B. Underwood, Esq., two miles from Grass Valley. They all exhibit thrift and high perfection in their growth, while the majority of them, by their limited culm and vast blades are distinguished as among the most nutricient and desirable species known.

We enumerate them in the order of their value: 1. Blue Grass. 2. Bunch. 3. California Timothy. 4. Heavy Top. 5. California Blue. 6. Swamp. 7. Rat-tail. 8. Tickle, similar to this well-known variety in the Western States. 9. Wire. 10. File. The Blue-grass, upon which are reared the noble cattle and fine steeds of Kentucky, succeeds most admirably on the farm of Mr. Underwood. Some eighteen months since he sowed a small quantity of seed about the numerous springs which burst from the foot of the mountain where his lands lie, and it is mingling miscellaneously with the Creole gramiuæ, above which its blue tops are seen waving in triumphant luxuriousness, and true American-like, bids fair to crowd out every indigenous variety.

With the grasses, the doctor exhibited to us, forty-three stalks of black-rye, growing from one seed, all flourishing and of fine size, likewise, a species of clover, entirely new. This Mr. U. thinks, will prove a fine fertilizer; it attains to more than a foot in hight, its bloom is charming, the fattening herds revel in its luxuriousness. The botany of the mountains is mostly new and novel, and we trust that its supreme beauty and meritorious character will ere long give it a place within the pale of science.

Rose Culture for Profit.

Roses are extensively cultivated about Adrianople, for the fragrant oil which they produce. The rosefields in the vicinity of that city extend over some 14,000 acres, and furnish a most important source of wealth. A traveler who recently visited this locality, writes that the season for "picking" is from the latter part of April to the early part of June; and that during that time the plains are one vast garden full of life and sweetness. Hundreds of Bulgarian boys and girls are out gathering flowers, from early morn to eve; while the air is impregnated with fragrance and enlivened with songs, music and dancing.

If the weather is cool, and copious falls of dew, with occasional showers, bless the gardeners, the crop is abundant, and large quantities of oil are secured. In favorable seasons, twenty-three pounds of leaves yield a miscal (1½ drachms) of ottar of roses; in dry and hot seasons this yield is reduced sometimes one-half. The average aggregate yield of the district is about 700,000 miscals of ottar, which will generally bring, upon the spot, something over $500,000. An acre of ground, well cultivated, will yield about 150 drachms, which is worth $75. The cost of production and extraction is about $50, leaving $25. The oil is extracted by the usual process of distillation. It passes into foreign markets chiefly through Constantinople and Smyrna. Before going beyond these places, however, it is almost universally adulterated with sandal-wood and other oils. So universal is this practice, and so little is known abroad of the genuine ottar of roses, that the pure article can scarcely be sold.

Fragrance Artificially Imparted to Flowers.

We have shown in previous issues how flowers may be artificially colored. Another singular discovery was reported in an Italian paper, some few years since, to the effect that a pleasant fragrance may also be artificially bestowed upon inodorous flowers; while the natural fragrance of others may be more or less modified or blended. The discovery was said to have been made by an Italian florist in Aricia, and the process as described substantially as follows. We give it for whatever it may be worth:

In order to attain this object, the roots of the plants are covered with fragrant manures. Thus, with a decoction of roses, the discoverer has been enabled to give to the Rhododendron the perfect fragrance of the rose. In order to insure a successful result, it is necessary to treat the seeds of the plant to which it is desired to give fragrance. They are steeped two or three days in the required essence, then dried in the shade, and shortly afterward are sown. If it is desired to change the natural odor of the plant for one more agreeable or more desirable, the strength of the essence is doubled or tripled, and a change must be made in the nutrition of the plant. In order to make the artificial odor permanent, the plant must be sprinkled and dampened with the essence several days in the spring for two or three years. And thus, also, it is said, a gardener may, at his pleasure, cause different plants or trees to share their odors with each other, by boring through the stalk, or trunk, or root, an opening into which to pour the fragrant ingredients.

Fruit-Grower's Meeting.

The fruit-growers of California met in this city on Wednesday last, for the purpose of devising some concerted action with reference to determining the feasibility of sending fruit to the East *via* the Pacific Railroad. After passing a series of resolutions to that end, the meeting finally resolved itself into a permanent organization, and elected the following list of officers for the ensuing year: President, S. W. Shaw; Vice Presidents, B. N. Bughee and D. W. Grant; Secretary, W. H. Stevens; Treasurer, Charles W. Weston. Directors—H. Robinson and E. D. Llewellen, representing Alameda; L. A. Gould, Santa Clara; J. M. Thompson, Napa; R. B. Blewer, Yolo and Solano; A. P. Smith and W. K. Strong, Sacramento; J. M. B. Weatherwax, El Dorado; John Briggs, Yuba and Sutter; Mr. Rose, Los Augeles; F. W. Haskell, P. L. Webb, A. Lusk and W. K. Cummings, San Francisco; Mr. West, San Joaquin.

Annual meetings will be held on the first Thursday of May of each year, when the election for officers will take place.

The Convention adjourned to meet again on the 16th instant, when it is anticipated that some definite proposition from the railroad company will be presented with regard to the tariff to be adopted for the transportation of fruit.

The matter is one eminently worthy of consideration; and it is to be hoped that measures will be concerted which will make it advantageous to the railroad company to use the powerful means at its disposal for developing on this coast a business which, with a suitable market, must soon grow into mammoth proportions, and prove of untold benefit to our people.

Mammoth Rose Bushes.—There is a Cloth-of-Gold rosebush in the garden of Mrs. Col. Marshall, in the city of Savannah, Ga., the stem of which is 24 inches in circumference, and a *Marechal Neil* of 16 inches girth.

There is a Cloth-of-Gold rosebush trained upon the walls of a factory building in Augusta, Ga., whose stem is 72 inches in circumference, and whose branches are trained over a surface 70 feet high by 120 feet broad. This is probably the largest rosebush in the world.

The largest rosebush in Europe is said to be in Toulon, France. It measures 32 inches in circumference, and is trained over an area 75 feet long by 18 in hight. It is said that this bush often produces as many as 50,000 roses in the months of May and June.

The Intermixture of Seeds.—Varieties of beets, cabbages, turnips, and all other kinds for seed, should be set as far apart as possible, to avoid intermixture, especially cabbages, no two varieties of which should be seeded within half a mile, certainly never nearer than eighty rods. Beans may be planted nearer together, with less danger of mixture, than most other seeds. Any varieties may be grown close together, free from mixture, if they do not *flower at the same time*. Cucumbers, melons and squashes will not mix, as is supposed by many, neither will the watermelon mix with the muskmelon. The large, thick, white seeded squashes, with the fleshy stems, like the Boston marrow and hubbard, will not mix with the flat, drab seeded ones, with angular stems, like the winter crookneck, summer squashes, or common yellow pumpkins, but these latter will mix together. Whatever mixture takes place in the seeds of cucumbers, melons and squashes, tomatoes, egg plants and peppers, will not appear in the *fruit* the first year. It is in the crop from the seeds of different varieties of these which have been grown near together that the mixture will show itself the next year.—*American Agriculturist.*

How the French Fatten Poultry.

A large circular building, admirably ventilated, and with the light partially excluded, is fitted up with circular cages, in tiers rotating on a central axis, and capable of being elevated, depressed, or rotated, which are so arranged that each bird has as it were, a separate stall, containing a perch. The birds are placed with their tails converging to a common center, while the head of each may be brought in front by a simple rotary movement of the central axis. Each bird is fastened to its cell by leathern fetters, which prevent movement, except of the head and wings, without occasioning pain. When the feeding time comes, the bird is enveloped in a wooden case, from which the head and neck alone appear, and which is popularly known as its "paletot," by which means all unnecessary struggling is avoided. The attendant (a young girl) seizes the head in her left hand, and gently presses the beak, in order to open it; then with her right, she introduces into the gullet a tin tube about the size of a finger. This tube is united to a flexible pipe, which communicates with the dish in which the food has been placed, and from which the desired quantity is instantaneously injected into the stomach. The feeding process is so short that 200 birds can be fed by one person in an hour. The food is a liquid paste, composed of Indian corn and barley saturated with milk. It is administered three times a day, in quantities varying according to the condition of each bird. This food seems to be very satisfactory, for if any chances to fall they devour it all as soon as they are released from their paletots. The poultry house is well ventilated; but, of course, it is almost impossible for any place where 600 fowls are confined to be entirely free from smell. It takes about a fortnight to fatten a bird by this method. Before being killed the birds are left in a dark but well ventilated chamber for 24 hours without food. Each fowl is then taken up by its feet, wrapped up so as to prevent all struggling, and then bled so adroitly in the throat that its death seems instantaneous. The blood is then allowed to flow from it, and finally, after being plucked, washed, and cleaned, it is wrapped in a damp cloth and is ready for sale. From forty to fifty fowls are thus killed and sold daily.—*Scientific American.*

The Functions of Grass.

It is because of its exceedingly important character in the economy of nature, that green grass is so universally spread over all countries, and in all climates where air-breathing animals exist. Its functions are extremely interesting, and very remarkable. Grass acts first on inorganic matter held in solution in water, which its roots suck up at their extremities and combine with essential elements extracted from the atmosphere. When thus combined, the grass becomes nourishing food for herbivorous animals. Without it, they could not live at all. All their digestive apparatus is constructed with reference to appropriating food thus originally prepared in grass for their growth and health. Carnivorous animals could not feed on vegetable food, but as soon as that has been animalized by being eaten, then they feed on the flesh of those that feed on grass. Lastly, man, being omnivorous, has the necessary mechanical organs for digesting either vegetable or animal food, separately or combined. Grass, therefore, begins the process of furnishing food for the cattle on the thousand hills; men eat the beef; and so all flesh is actually grass, according to the Bible. Destroy the grass, and the great magazine of universal food would fail, and all animal life would cease by starvation.

To Cover a Steep Bank with Grass.—The following method is recommended by a German horticultural association. For each square rod to be planted, take half a pound of lawn grass seed, and mix it intimately and thoroughly with about six cubic feet of good dry garden earth and loam. This is placed in a tub, and to it liquid manure, diluted with about two-thirds of water, is added, and well stirred in, so as to bring the whole to the consistency of mortar. The slope is to be cleaned off and made perfectly smooth, and then well watered, after which the paste just mentioned is to be supplied with a trowel, and made as even and thin as possible. Should it crack by exposure to the air, it is to be again watered and smoothed up, day by day, until the grass makes its appearance, which will be in eight to fourteen days, and the whole declivity will soon be covered by a close carpet of green.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, July 10, 1869.

City Stocks.

The week under review has been a dull one so far as stock dealings of every description were concerned, the Board having adjourned for a number of days to allow a general holiday during the period in which our national anniversary occurs....Sales of Spring Valley Water Co. stock were made at $64 50@64 25....The Pacific Insurance Co. have declared their usual quarterly dividend of 1 per cent. per month for the quarter ending June 30th. The annual meeting of stockholders will be held on Tuesday, the 13th instant. The Union Insurance Co. has also declared its usual dividend, payable on and after the 12th. The Occidental Insurance Co. announce their usual quarterly dividend of 1 per cent. per month for the three months closing with June; and the People's Insurance Co. their usual monthly dividend, both payable on and after the 10th inst. ....The savings banks are beginning to announce their dividends out of the earnings of the past six months. The Odd Fellows' Savings Bank will disburse 13 per cent. per annum, free of Federal tax, on and after the 15th. The Savings Union pay at the rate of 11 2-3th per cent. per annum on term, and 9½ per cent. on ordinary deposits, in both cases free of Federal tax, on the 15th inst. The German Savings and Loan Society same dividend as Savings Union. The Sacramento Savings Bank had $1,303,181 55 on deposit on the 30th of June, distributed among 2,510 depositors. They pay a dividend of 1 per cent. per month for the first six months of the current year.

The Stockton Savings Bank credits its depositors with $261,659 at the close of June. Stockholders receive a dividend of 12 per cent. per annum; six months depositors, 10 per cent.; three months depositors, 8 per cent.; and transient depositors, 4 per cent. The Savings and Loan Society disburses a dividend of 12 per cent. per annum, free of Federal tax, out of the earnings of the past six months. At the close sales of Pacific Insurance Co. stock were made at $103@110 per share.

Mining Share Market.

Owing to the interruption of stock transactions during the period since our last similar reference, by the recurrence of our national holiday, the market has been confined to a few days' business; however, during that time the sales have been quite large and prices very fair, extending very generally over the list of the Board and including a considerable amount of White Pine stocks.

From our carefully compiled record of the sales in the San Francisco Stock and Exchange Board, we give the following interesting figures, for the first six months in 1866, 1867, 1868 and 1869:

MONTH.	1866.	1867.	1868.	1869.
January....	$2,727,187	$3,654,322	$8,638,934	$7,964,734
February...	3,752,282	3,303,520	9,716,596	6,818,644
March.....	5,226,084	4,034,288	11,471,830	6,954,145
April.....	4,034,096	5,389,918	12,385,304	7,286,211
May.....	3,052,102	7,651,855	10,162,396	6,961,913
June.....	2,406,341	6,964,365	9,078,063	6,336,337
Totals....	$21,275,102	$31,113,367	$61,513,123	$42,501,984

HALE & NORCROSS—met with a considerable demand at prices ruling for some time past. The ore extracted during the week ending July 3d, amounted to 1,321 tons, 547½ coming from the fourth station and 600 from the fifth station. During the same time 902½ tons were delivered to the reduction mills; on hand, 1,923½ tons. The fifth station will require retimbering, taking several weeks to do it; however, this will not interfere with hoisting from stations above. They intend to work sixteen hours and hoist from the fifth level during the remaining eight hours, which will not materially lessen the product. On the fifth station they are cross-cutting and developing the southern portion of the mine, which is reported to be looking well. The south winze which they are raising up from cross-cut No. 1 is in excellent ore at the height of fifty feet above the fifth level. In the old mine the cages are now running to the 900-foot station, and they are now re-opening the single east drift on that level. During the present week $32,145 in bullion came to hand. A dividend of $6 per share is payable on and after the 10th.

CHOLLAR-POTOSI—has been in good request. For the week closing July 2d, 1,660 tons of ore were mined, 700 of the amount being extracted from the Blue Wing locality and 960 from the New Tunnel. In the Blue Wing the faces of the stopes show more ore and of an improved quality. In other portions of the mine no material change is noticeable. They paid a dividend of $20 per share on the 7th. The aggregate yield of bullion for the month of June is $175,700.

GOULD & CURRY—has been quite active. The ore extracted during the week ending July 5th, amounted to 380½ tons. The bullion returns for June foot up $58,219. No important changes in the mine. The breakage of the crank shaft to pump gear has temporarily interfered with work at the seventh station....IMPERIAL shows a yield of $26,386 in bullion, and EMPIRE $15,277 during the month of June....SIERRA NEVADA pays a dividend of $2 50 per share on and after the 10th. Capital stock has been increased from $1,500,000 to $3,000,000, divided into 15,000 shares of $200 each. The office has been removed to room 15, third floor, of the Express building....GOLD HILL QUARTZ shows a bullion product of $6,074, and SAVAGE $89,500 during the month of June....OPHIR drift is 413 feet in length.

AMADOR (Cal.)—reports that in the new south shaft they have a bowlder ledge, on the west side of the "gouge," very similar to that in the north shaft stopes, and will pay from $6 to $8 per ton at a point fifty feet below the surface. This ledge is twenty-two inches in width, and together with the gouge (22 inches) and the main vein of sixteen inches, which pays from $18 to $20, they have a vein of five feet. Balance of the mine is looking as well as usual. A dividend of $8 per share is now payable....EUREKA (Cal.) disburses a dividend of $5 per share from and after the 10th....NORTH STAR (Cal.) levied an assessment of $20 per share.

We are indebted to the "Commercial Herald" for the following interesting

MINING REVIEW.

THE WHITE PINE MINES.

It being now nearly a year since the people of California began first to hear much about White Pine, and a little more than half that time since immigration and capital began to flow actively into that district, a brief review of its history might not, just now, be altogether inopportune.

One year ago, then, there were not above three or four hundred inhabitants within the limits of the White Pine District, a large proportion of these being mere sojourners. The population, up to that time, and for a month or two after, was somewhat transient—people coming and going—because, while the ores were evidently rich, and the surface deposits apparently extensive, they could not satisfy themselves as to their probable permanency. Then, there were no mills or reduction works there, except the small establishment of the Monte Cristo Company, fourteen miles distant from the mines. No towns had been built—Treasure City and Hamilton consisting of a few rude cabins, not exceeding thirty or forty in number. No roads had been constructed, nor were there then more than two or three lodes in the district at all developed. The bullion product had, up to that time, reached only a few thousand dollars, being chiefly the proceeds of Eberhardt ore, the most of which had been sent to Austin for reduction. As yet, not a sample of these rich ores had reached San Francisco, nor was anything known here of the wealth of White Pine, except what could be gathered from the vague rumors that had then begun to spread abroad. We then knew less of White Pine than we do now of a dozen other districts around it. In June, 1868, there were, probably, not over two or three hundred company claims recorded in this district—now there are more than four thousand; an increase not referred to as being a creditable achievement, or one likely to promote confidence in the district, the greater proportion of these locations being worthless, and not a few wholly mythical. During the months of June and July population increased slowly, and not much progress was made in improvements. In September more people came in, confidence in the mines increased, and every branch of business was marked by greater activity and energy. Roads, already laid out, were built, mills were brought in, and the owners of promising claims began to prospect the same on a liberal scale. No large sales of mining properties had, however, as yet been effected, and the prices of town lots remained at low figures. By the middle of October one ten-stamp mill, erected by General Page, at Shermantown, had been got in operation; and, by the tenth of the following month, another of like capacity, put up by Jeremiah Miller, was running at Hamilton. The starting of these mills gave a new impulse to business, and people beginning to flock into the district, and real estate as well as mining claims soon began to appreciate. By the middle of November a good many capitalists had already visited or were then collected at White Pine; and before the end of the following month a number of leading mines had been disposed of. During this period the Stanfords had bought the California and the South Aurora mines; and the Virginia, the Pocotillo, the North Aurora, Hidden Treasure, Featherstone, and several other valuable claims, had changed hands; the purchase money amounting, in the aggregate, to considerably over a million of dollars.

Toward the latter part of December the winter set in with great rigor, continuing, with but slightly interrupted severity, until the middle of May—seriously interrupting work in the mines, and preventing most kinds of out-door business being done to any advantage. During all this time—a period of four and a-half months—very little could be accomplished, not only on account of the cold and stormy weather, but chiefly because there was no lumber or other material for building, no fodder for stock, and but very limited supplies of most staple articles of food.

Throughout the whole of this inclement period, while the cost of living was enormous, and when little or nothing could be done, multitudes, disregarding the warnings against such a course given on every hand, rushed to White Pine, there spending their money and means, so that many were obliged to leave before the season for prospecting, or even seeing the mines to advantage, had arrived. These people, disappointed and disgusted with their experience, left the country, cursing its rigorous climate and denouncing the mines. In the meantime, thousands of worthless claims had been located, many of which the locators, taking advantage of the reputation of the really good claims in the district, managed to dispose of, generally for small sums, parties excited by the rich ores exhibited being disposed, notwithstanding they had often lost by this sort of venture, to risk a trifle where the chances seemed so good. And thus it happened that large numbers of persons became interested in a small way in these mines during the winter, when little was or could be known about them, to find, on the approach of spring, that they had nothing to represent the property purchased, except, perhaps, a thread of spar or a bunch of barren quartz. The deceptions practiced in this manner have lead to a wide-spread distrust of the White Pine mines, and done much toward discouraging investments in that region. It is an indisputable fact, however, that those who purchased properties at all developed, buying only on careful inspection, have in every instance done well, and could to-day realize two or three hundred per cent. on their investments, and in some cases much more. In fact, never before have men investing in any mines had more cause to congratulate themselves on their ventures than those who purchased largely and intelligently at White Pine.

Having shown how little had been accomplished in this district one year ago, we will briefly glance at the work since done, and the progress that has been made, as affording the best evidence of the enterprise and energy displayed by the inhabitants, and their confidence in the resources and future of the country.

There are, then, at the present time, ten quartz mills completed and running in the district. These mills carry an aggregate of 112 stamps, and, including sites, water franchises, etc., have cost a total of not less than $600,000. Three considerable towns have been built, many of the structures being of a capacious and substantial kind. At least 150 miles of toll roads have been constructed, at an expense of fully $150,000. Over 20 saw-mills and smelting works have been put up. Immense quantities of wood have been cut, and many thousand feet of lumber manufactured. A vast amount of work has been done upon the mines, from which eight or ten thousand tons of ore have been extracted. A magnificent system of water works has been projected and brought nearly to completion; besides which, a great many minor enterprises and improvements have been planned, and many of them executed; nearly all of which, it should be borne in mind, has been performed during the rigors of a long and dreary winter, with labor and all kinds of material at exorbitant prices.

In and about the mines and mills there are now employed about 2,000 hands, whose wages average $5 per day. About 3,000 tons of ore are raised every week, of which not over a third is milled, for want of reduction facilities. The weekly product of bullion amounts to about $120,000, with the prospect of being increased at least one-half within the next six months. The ore now being crushed averages considerably over $100 to the ton, each stamp crushing about a ton and a quarter per day. There have now been extracted from the White Pine mines very nearly $2,000,000, it being scarcely a year since the first crushings were made, and not more than six months since no more than three mills, all of small capacity, have been running on these ores.

THE COMSTOCK LODE, ETC.

In the Comstock mines no important changes have occurred during the period under review. In the Hale & Norcross ground heavy bodies of good ore have been developed, imparting a stimulus to companies prospecting for ores in their lower levels in the vicinity. The Savage and Hale & Norcross may be classed as the most successful companies on the Comstock during the past six months. The fire in the Gold Hill mines proved a more serious affair in a pecuniary point of view than was at first anticipated; not that it damaged the mines so seriously, but from the fact that it was so long before it could be extinguished, causing a stoppage of mills, product of bullion, labor, and business generally.

The product of ore from the various mines has been quite large, but the yield of metal per ton has been below what may be considered the average of last year. This, however, has been attended with a lessened expense, but not enough to make up the former aggregate profit per ton. The Carson and Virginia Railroad is being pushed with vigor, and will no completed within the coming quarter, an avant that will cheapen transportation, and allow most of the ore to be reduced by water-power, thereby enabling the working of ore which otherwise could not be made to pay for reduction. Outside mines in Storey and Lyon counties have contributed quite a large percentage of the ores lately reduced at the mills in that part of Nevada.

In California there has been less activity and change than in the State of Nevada, but at the same time a steady advance. The quartz interest especially has been quite active of late. In several of our more northern counties surface diggings have paid handsomely, and in a number of places old diggings have been rewashed with profit. In most places, however, the old surface diggings have fallen into the hands of the Chinese, who are now found in nearly every ravine and gulch in the gold-bearing region of the State, though it is impossible to form any correct idea of their gains, further than estimating their time at $1 per day, a Chinaman never leaving when he can make that sum daily.

The mining ditches that formerly yielded so largely no longer pay except in a few localities. The more extensive use of water for driving quartz mills will, however, gradually cause this species of property to appreciate in value.

The gathering of sulphurets carrying more or less of gold is gradually becoming a business of importance in surface mining. Formerly, when large quantities of water were used for sluicing purposes, it was impossible to save these sulphurets. But with improved facilities and cheapened labor, this business can now be made remunerative, the only drawback to a much more marked success being the difficulty still experienced in extracting the metal after the sulphurets are collected.

Quartz mining has made satisfactory progress during the past half year, the only thing required to insure the general success of this great industry being cheaper machinery and labor. With any material reduction in the cost of the former, men of small means would be enabled to carry on operations on a limited scale, gradually extending them as their ability increased.

A very considerable reduction in the cost of extracting the ores is likely to occur through the use of Giant Powder and the introduction of the single-hand drill, it being shown by actual trials carried on through several months that ore could be broken out with Giant Powder at a cost of less than one-half that attendant on its extraction by black powder. The principal objection urged by miners against the employment of this new explosive, that it is injurious to health, is considered untenable by many who have experimented with it on an extended scale. The late very general and long extended strike of the miners in Nevada country, without settling the questions at issue, viz: the introduction of the Giant Powder and the employment of the single-hand drill, has had a most mischievous effect in a variety of ways. Through this cause the laborers themselves have been thrown out of work and deprived of their earnings, while the mine-owners have lost the profits that they might otherwise have realized from the working of their ores. The product of bullion has been reduced, and business of all kinds in the vicinity has been made to languish; and, finally, the probability of Chinese labor being substituted for that of white men has been rendered imminent: a result that, however it might benefit the proprietors, could not fail to operate to the permanent injury of the white miner.

A difference of one dollar on the cost of raising and working a ton of ore has now become the determining question whether many of our mines are to be worked or to remain idle—a point that the use of Giant Powder and the single-hand drill will in many cases be able to settle in favor of a continuance of operations; a circumstance that renders the determination of this matter one of great practical importance.

It is the opinion of many that quartz mining is likely, in any event, to experience a decided expansion in California; the introduction of more effective methods of saving the metal, and the reduced cost of labor and machinery, coupled with a growing spirit of economy, tending to warrant this conclusion.

The smelting furnaces in the Cerro Gordo District, Inyo county, have been doing a largely increasing and profitable business of late, the crude metal accumulating to such an extent that it has been found expedient to erect refining works, so that the precious metals may alone hereafter be shipped, the lead being retained to await increased facilities for transportation. New companies have lately commenced the construction of additional furnaces in that locality, and it will not be long until California will be producing silver in notable quantities.

In Oregon, mining enterprise is being gradually extended, though not marked by any special activity.

In Idaho, less is being done in the department of quartz mining than formerly, owing, in part, to a large emigration from that Territory to the White Pine region, and in part to the recent disastrous failure of what was considered one of the representative mines of the country.

From Arizona, more encouraging accounts reach us this year than have emanated from that country for several years past; and as a number of companies have fitted out in San Francisco with a view to making a more thorough exploration of that Territory than has ever yet been made, it may be reasonably anticipated that important discoveries will transpire in that quarter before the season is over.

A new feature in the disposition of ores arises from the practice, now becoming prevalent in many parts of the State of Nevada, of sending large quantities of rich but rebellious silver ores by railroad to this city for reduction or a market; a method of disposing of this class of ores that will no doubt soon grow into general favor, in view of the satisfactory results that have attended these first trials. Thus far, more argentiferous ore has reached this city the present year than arrived during the last two preceding years.

JAMESTOWN, Cal., July 6th, 1869.

MESSRS. DEWEY & CO.—GENTLEMEN:—The Patent for our Ore Washer and Concentrator was duly received by express. We return you our thanks for the promptness and successful manner which have attended your efforts in our behalf. Yours, WM. G. HESLEP.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Tarshish.—*Miner*, Jnne 26th: Mr. Schwerin is having constructed under the snperintendence of an old placer miner, a set of slnices for the purpose of concentrating the soft Tarshish ore.

M. C. M. Co.—An old and experienced amalgamator offers to erect roasting furnaces for the Monitor C. M. Co's mill, which shall roast our ores and render them fit for amalgamation at an expense not to exceed $5 per ton; the M. C. Co. to accept and pay for the same when it is proved. The offer will be accepted, and the success of the plan will decide the long vexed question of profit from onr low grade ores.

Morning Star.—*Chronicle*, June 26th: Election of officers was held on the 17th. The present snperintendent, Mr. Gamble, is retained. He has received orders to get out all the ore in sight in the npper levels, and we hope to see the working force greatly increased as soon as the new officers get posted.

Mountain.—There is a change of rock, and better headway is the result.

AMADOR COUNTY.

The Keystone mill, of 20 stamp capacity, crnshes ont an average of ahout $25,000 per month.

Muletown.—Mining at this ancient burg is being carried on pretty extensively, and pays well. Many more claims that are believed to be good, wonld be worked but for the fact that they were located on the Seco grant, and miners are compelled to pay a tax before a permit will be granted them to prospect.

CALAVERAS COUNTY.

Lower Rich Gulch.—*Chronicle*, July 3d: The 16-stamp battery on the Palomo is kept at work day and night, the rock yielding fair returns. The lead increases in width and richness as the shaft goes down. Alexander & Co's mill never stops, and it pours a constant stream of the precious metal into the pockets of the owners.

Railroad Flat.—The main shaft on the Petticoat mine has reached the depth of 200 feet. Levels will now be run upon the lead and sufficient rock taken out to keep the mill in constant operation. Labor is being continued vigorously upon the various mines in the district with success.

EL DORADO COUNTY.

Georgetown.—Correspondence of Placerville *Democrat*, July 3d: The Eureka Co. have their 8-stamp mill and chlorine works completed, and will start up about the 6th. Wood & Co. have their machinery on the ground and are putting up a water mill. Other claims are working. Some very rich specimens have been on exhibition for some days, taken last week out of the Crane's Gulch claim.

KERN COUNTY.

McKneadney Mine.—Havilah *Courier*, June 29th: The miners made a clean up on Thursday. Eight hands, four weeks' run, worked about 70 tons, which yielded $2,950. The proceeds were appropriated to paying the back wages.

LOS ANGELES COUNTY.

The *Star* of June 26th says: We were shown this week specimens of silver ore from a vein near the line of the San Ymidio Rancho. The ore looks very rich. The lode indicates a breadth of several feet.

Near Fort Tejon there is a gold mine being prospected by Treadwell & Co. Should it maintain its present indications there will be a mill placed on the premises.

NEVADA COUNTY.

Empire Mine.—Grass Valley *Union*, July 1st: We mentioned on Tuesday that the Empire had started up, and that probably enough hands to fill the mine could be had within a day or two. Our hopes proved delusive. Yesterday a number of men were cautioned that if they persisted in working, misfortunes would befall them. So on Weduesday, only about half the men went down the shaft. The men are even afraid to tell the names of the parties who warned them. The labor of this place it seems is held nnder threats of violence, and we think it about time such things were stopped.

Same of 2d: The Empire is running ahead with both shifts full of men. This is rather an unexpected state of affairs.

At the Eureka yesterday, several car loads of splendid rock came to the surface.

Hartery.—3d: A clean up of one week's run of the Hartery mine was brought to Delano's bank yesterday, and made 196 ozs. 13 dwts. gold.

The *Union* of the 3d has a long editorial on the Empire mine and the strike. There have heen more threats. It places before the people of the town the serious question, "What shall be done?"

At the Cascades.—*National*, Jnne 30th: The Red Diamond Co. have completed their flume, 700 ft. long, and have commenced hydraulicing. They use 300 inches of water and employ five men. The Nevada Consolidated Blue Gravel Co. are making preparations for a general clean up. They are working 14 white men and 13 Chinamen.

Wisconsin.—This mine has not been affected by the strike, but has pnrsued the even tenor of its way, yielding good rock and giving employment to 60 men. Last week the owners purchased the Burnett machinery, consisting of a fine engine, 12-inch cylinder and 24-inch stroke, good hoiler, and hoisting aud pumping gear. This machinery has never been used.

Same of July 2d: In the Wisconsin, rock now taken from the fourth level, looks exceedingly well. Ben McAuley, at the Sebastopol mill, has just completed a crushing of 150 tons from the mine, from which $30 to $40 per ton was realized, including sulphurets.

Clean Up.—Same of 3d: The Higgins ledge, known as Frank Morse's mine, continues to pay well. A clean up was had yesterday after a run of less than two weeks, which panned out over $2,000, exclusive of sulphurets.

Celestials.—*Gazette*, July 1st: Abont 60 Celestials left Nevada yesterday for North Bloomfield. They are to be employed in extending the ditch of the Gravel Co. to Big Cañon Creek. The digging of this ditch is a great internal improvement. Without Chinamen, it would not have been attempted.

Empire Again.—Same of 3d: Notwithstanding the threats made against the workmen in the Empire mine, and the number that left in consequence, the mine is still running with a full complement of men. A good many of the workmen are from other points in the county.

Perrin & Co.—5th: We saw on Saturday a gold brick, valued at $1,019. It was the result of 46 loads of rock crushed at Jos. Perrin's mill, on Wolf Creek. The crushing previous to this yielded $30 a ton.

Mining Property for Sale.—The Union mine, with the boisting and pumping machinery, and the Forest quartz mill, are offered for sale.

PLACER COUNTY.

Letter to Butte *Record* of July 3d: At Damascus there are several companies just striking through to pay dirt, and everything is lively. The Mountain Gate claim has, through the labor of five or six men, yielded for the last four years more than the expenses of 30 men engaged in opening out a drift through another part of the claim. They have now finished the worst part of the joh, having two tunnels of thirty-odd huudred feet run into the mountain side.

SHASTA COUNTY.

Roaring River.—Correspondence of the *Courier*, July 3d: The three ditches traversing this section are now in good repair and cover some of the best placer mines to be found in the State. The best diggings are now found in the banks and bars from five to fifteen feet deep, and can be worked to the best advantage by blasting powder and bydranlic pipes. Now the supply of water is more abundant thau at any time during the past six years, and is sold to miners at eight cents an inch. There is any amount of unclaimed ground covered hy the ditches which will pay.

SIERRA COUNTY.

Progressing.—Downieville *Messenger*, July 3d: The work on the Hog Cañon quartz mill and mine is said to be progressiug rapidly. . .The Keystone Co. is puttin a new and larger pnmp iu their shaft. I understand tbat the last clean-up was best ever made at that mine....Wate given out at the Woodchuck mine.

TRINITY COUNTY.

Canon Creek.—Corresponder *Journal*, July 3d: D. Evans in' tend the Depinette ditch do about three miles, to Conr season. Should this ent' tbrough, it will make Cañon Creek, for the dit dreds of acres of good

TUOLUMNE COU

Rich Strike.—S 3d: J. W. Ander Curtis Creek, a f of quartz, bear week an assay of 96 ounces of gold and 24 ounces of silver to the ton. The lode is on Curtis Creek, below Algerine.

Another Chipsa.—A piece of pnre gold weighing 22 ounces was found in the old Daly claim at Columbia on Wednesday last.

Arizona.

Black Canon.—Prescott *Miner*, June 12th: The few miners at work in Black Cañon Creek, are doing well. A miner recently wrote to some friends here to go down there, as they conld make $6 a day; and many will go, as soon as the rains raise the water.

Black and Bradshaw Monntains have never yet been prospected. There is no trouble ahout finding diggings in this country; the trouble arises in the working of them. Large parties cannot agree among themselves, and small parties dare not stop long in one place, on acconnt of the Indians. When the time comes that two or three men can, with safety, start out alone, and work, then will come flush times.

Items.—Work on the Sterling goes on as usual....Gennuy's arastras were running on Montgomery ore at latest accounts.... The Vulture is yielding plenty of ore. Both mills are at work....The White Picacho is to be worked....Gray & Co. will soon start their mill at Big Bug.... Geo. Lount has, he thinks, discovered the reason why the Paul & Wood process failed on Chase ore....A. French iutends to rent a mill on Lynx Creek, and work surface ore.

Bashford Co.—This company will cut a ditch to carry water into the gulches back of the old Mexican camp, on Lower Lynx Creek. They will take the water from a creek that empties into Lynx, near the old French diggings. The Mexicans merely skimmed the bedrock in the gnlches.

Independence Mine.—Same of 19th: On the 12th, the shaft was down 25 ft.; the lode 12 ft. thick, and the rock rich in free gold. About 100 tons of rock were on the surface, which Mr. Boggs says he intends working in arastras. He brought over three ounces of amalgam — worth $30— which he got from 40 lbs. of rock.

Montgomery.—The news from this mine is cheering. Geo. Monroe says the wheel and arastras work well, and the rock was the richest he had seen in the Territory.

Black Cañon.—Mr. Branerman has informed us that the miners in Black Cañon Creek, worked in the diggings as long as the water lasted, and made very good wages. He weighed, for one miner, 1¼ pounds of gold.

Lower Lynx Creek.—Joseph Revoirs and partners have averaged $7 a day each, in their claim. They are now waiting for water.

Walker's District.—Ed. Bowers, Supt. of the Wells Hydraulic Co., has completed one mile of ditch to carry 500 in. of water, and one-half mile which will carry 300 in. A large reservoir, in Rich Gulch, will soon be finished.

Henry Herbert, an old Nevada County, Cal., miner, had found prospects below the cañon—that warrant the belief that the har will pay $7 or $8 per day to the hand. Uncle Billy Pointer was working on his lode, and taking out very rich rock.

Colorado.

Bullion.—Central City *Herald*, Jnne 16th: Warren Hussey & Co. had three retorts on their counter last evening, one of 105 ozs. from the Jones, one of 92 ozs. from the Bobtail, and a large one from the U. P. R., besides a number of smaller ones, in all about 600 ozs., all of which came in during two or three days.

New Lo -Richard Snaire and another
man hav new lode, and called it

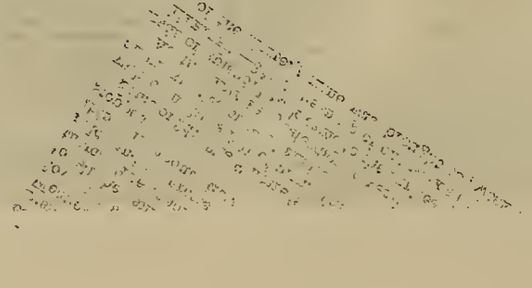
unco
ft



are of the opinion that the richest and strongest vein has been missed entirely in running the drift east from the main shaft. The mine, if properly worked, ought to give employment to a large number of miners. The Central Gold Mining Co. is one of the corporations whose operations have been disastrous to the stockholders and a curse to Gilpin county.

Georgetown Items.—Mr. Burleigh has returned from the East, and will push the Burleigh tunnel with vigor....The Baltimore Co's tunnel above Brownsville is going into tbe mountain two feet per day.... Stewart's works are in full blast, turning out from 1,800 to 2,000 ounces of silver per week, running on Equator ore for the last three weeks, and in a few days will again commence on ore from the Terrible mine....Saw a 1,500-ounce brick from Clark & Co's bank, yesterday, from Stewart's, out of Equator ore....Kurtz's Concentrating Works are approaching completion.

The *Register* of the 22d says: Professor Hill's works are sending up the smoke of their burnings continually....The Teats mine never looked better than to-day. A large force is at work taking out the best ore ever produced in Colorado. An assay made a few days ago hy Von Shultz gave $29,000.

Idaho.

Big Clean Up.—Idaho City *World*, June 24th: Doc. Noble, Saunders, Elkins, Noble & Alderson, on Buena Vista Bar, last Saturday, after a run of fourteen days, cleaned up nearly $5,000.

Keystone Ledge Ore.—Bailey Simpson showed us some ore from the Keystone ledge, which had been roasted in a forge, and showed silver all through.

New Quartz Ledge.—We learn that a ledge was discovered Saturday, near Democrat Gulch, which prospects richly, and crops out an average width of over three feet, so far as traced, a leugth of two miles.

Bullion.—Silver City *Wave*, July 2d: Wells, Fargo & Co. shipped during June, from their office in Silver City, $96,320 coin, equal to $128,426 currency. We know of shipments by private hands amounting to several thousands, that will swell the coin value perhaps to $110,000.

Moose Creek Mines.—A. C. Wellman writes the Walla Walla *Statesman* of June 18th from Pierce City, that "there are only about 40 claims that pay anything at all, and even these cannot be worked but a short time longer on account of water. Ditches are being brought in, hut it will take all summer to complete them. Before the claims were opened the prospects were very flattering; one, two, three, and even $20 was got to the pan, but the leads, after working, have proven to be very narrow and spotted. The basin is low, yet diggings are well np to the head of the gulches, making natural water scarce. The largest week's work yet made was 48 ozs. to two men, and the largest nugget $117."

Warren's Diggings.—The Walla Walla *Union* says: Warren's diggings are badly off for paying placer claims, though they have some good paying ledges and two mills running. A discovery has recently been made in Jaw Bone Flat, near Lewiston, but requires a ditch at a cost of about $15,000 to be successfully worked. The probability is the ditch will be brought in.

Nevada.

COPE DISTRICT.

The *Enterprise* of June 29th gives a notice of this new mining region, having obtained items from Col. Frank Denver, just returned. We condense: "The mines are favorably situated for working, and the leads of good width. The ores are sulphuret, chloride and ruby silver. As yet but little work has been done. Col. Denver and party stripped the ledge for a distance of 300 feet, and found it to be on an average 5½ feet in width. Three hundred pounds of ore from this lead worked at the Miners' Foundry, San Francisco, yielded $420 per ton.

They have laid out a town called Mount- ity, on the banks of the Owyhee n the town and the valley there 300 persons. In the vicinity ower sufficient to run 1,000 er of the district is 20 line.

way to Mountain nines 20 miles in which is found. s to s

great source of revenue to its owners; but that outside of this, others have have not as yet been discovered.

The Elko *Independent*, June 30th, says the daily reports are encouraging. It gives also a letter from Bull Run, a new district due north from Elko, with ledges said to be like those of White Pine. The same speaks of rich discoveries on the east side of the Ruby range, and great excitement among the ranchers.

HUMBOLDT.

BATTLE MOUNTAIN.—Correspondence of the *Enterprise*, July 1st: "Beyond doubt, these are the richest and most extensive copper mines in the State, averaging 40 per cent. copper, and, in some instances, from $6 to $20 in silver. A number of companies have been organized in the Eastern States and England to develop them, some of whom are now delivering ore at the station for transportation by rail.

There are silver-bearing veins in this district, which are considered very valuable, among which the Little Giant is most prominent, paying a profit from the beginning, without capital. It is owned by A. P. K. Safford, Geo. W. Fox, Roht. McBeth, and John Mellander. The company have a 5-stamp wet crushing steam mill, complete in every particular. Several tunnels have been run on the vein, the lower one exposing the ledge to the depth of 250 ft., showing more ore than the mill can work in one year. I find that the average yield of this ore, up to this time, is $186 per ton; the hullion showing no gold, and averaging .994 fine in silver, bringing a premium of 2¼ per cent. The average width of the ore is about 16 inches, and is all milled without sorting.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

OCCIDENTAL MINE.—*Enterprise*, July 2d: Good progess is made in the lower tunnel. The rock is becoming softer.

SIERRA NEVADA.—The Sierra Nevada are still taking out large amounts of rich ore, and their mill of 20 stamps is pounding away day and night.

FLOWERY.—The mine is looking well, and fine ore is being extracted at both the shaft and tunnel. They keep their mill in constant operation.

JULIA.—The Julia Co. are going ahead with their shaft.

OPHIR.—Same of 4th: The Ophir Co. are making good progress with their shaft to the westward.

SACRAMENTO.—The mine is yielding a considerable amount of good milling ore. The summit mill is running on ore from the mine.

DIVIDEND.—The Chollar-Potosi yesterday declared a dividend of $20 per share, payable July 7th.

Virginia City correspondence of the *Herald*, dated July 3d: The Yellow Jacket Othello Co. have decided to erect their 10-stamp mill, now on the road from Elko, at Swansea.... *Telegram*, June 26th: The Logan mill in Swansea is fast approaching completion....Mr. Mosheimer's smelting works at Swansea will be in complete running order in from 10 to 12 days. The capacity of the furnace will be 10 tons per day. They have now a large amount of ore upon their platform, and more arriving daily. A great deal of the ore is about 70 per cent. lead, carrying from $40 to $50 of silver per ton.

OUTSIDE DISTRICTS.—TEM PIUTE.—Parties are negotiating for the Crescent mill. This mill was built two years ago by New Yorkers at a cost of $75,000, and has never run a single day. It is within 15 miles of the district....One mine has been opened which shows chloride from one end of the face to the other....Ely District is 140 miles southeast of Hamilton. A letter to the *Empire* of June 29th says: "Our mines are well-defined, and pay from the top down. We have milling rock and smelting ore in abundance. In the Pioche ledge they have gone down over 40 feet. We have a furnace for smelting ores capable of working from three to four tons per day. The district possesses plenty of wood. We have good springs of water." ....*Telegram*, June 28th: Assays of ore from the Oro Fino ledge, Sacramento district, gave $376 in gold... In Robinson district, Sam. Brannan is digging wells. The ores assay up to $200. Most of them will have to be smelted.

ITEMS OF MINING PROGRESS.—*News*, June 24th: Ince Hall's mine is turning out rich ore....Snow having disappeared from Metal Range, miners must leave for the present, having no water....The Whiteman and Loneman mine, has a shaft down 78 ft., which followed a fine hanging wall all the way....Same of 28th: The Alturas and Industry mines were connected on Thursday by the former breaking through. Saturday the Posthole broke through into the Alturas, and the latter's title not being as old as that of the former, the Alturas surrendered its ground. The Posthole did the fair thing, gave up all the rock extracted by the Alturas Co., and purchased the tools used in that shaft....Giant Powder is used on the John Dare....Twenty tons of ore was sent yesterday to mill from the Pocotillo, by pack mules....The Addington struck it on Saturdry....The Nevada (Treasure Hill Mill and Mining Co.,) Industry and Posthole mines have come to an amicable adjustment of title....30th: Pennsylvania started up yesterday....The Dorin has struck ore assaying from $236 to $722 per ton, at a depth of 38 ft....July 1st: The Mammoth has purchased the Shehoygan....Ore assaying $1,900 has been taken from the Excelsior mine....*Empire*, June 27th: One hundred and twenty-five tons of ore from the Rattler mine, crushed at Dunn & McCone's mill last week, yielded $19,040, or $152.32 per ton.

an abundance of ore and the mills to work it.

Oregon.

CANON CITY.—Dalles *Mountaineer* correspondence, June 9th: The Prairie Diggings Co. has a good ledge, an excellent mill, and fine water-power,—and is making good dividends.

WILLOW CREEK MINES.—The Portland *Oregonian* of June 19th, says: The mines on Willow, Birch and Camp creeks prospect finely, but the want of water halks all profitable enterprises. During this season the great ditch will probably be completed, and it is expected that next spring will open with more favorable prospects.

Wyoming.

ITEMS.—The *Sweetwater Mines*, June 23d: Mason & Co. are prosecuting work with vigor on their quartz mill on Little Hermit Creek....Pease & Co., of Atlantic City, are extracting ore from the Caraboo to be crushed in their arastra....There was a rumor on the street yesterday that placer diggings had been discovered a few miles from here that would yield 40 cents to the pan....James Mills is driving ahead the work on his quartz mill....The Confidence ledge shows free gold in abundance. There is a shaft down eight feet, and a vein of quartz over five feet in width....Ledges, and rich ones too, are daily being brought to light that have been trampled over thousands of times. The custom mills that are in course of construction will soon be ready to crush any amount.

ITEMS.—Same of 26th: Mr. Mill's mill is going rapidly forward. Kitter & Mason's mill, on Little Hermit Creek, is also progressing. Mr. Anthony's mill at Atlantic City, is completed, and Rice & Co's mill will soon be crushing....Hunt and Daniels on Cariso Gulch, cleaned up yesterday. Amount not known, but big....Rock Creek claims are paying better than was expected. ....Thos. Collin's 20-stamp mill is on the road from Chicago....We were shown quartz this morning from five ledges discovered on the 15th. The rock is sticking full of free gold, and we are told that as far down as they had sunk, gold was visible. These ledges are four miles from South Pass, and three from Atlantic City, up Rock Creek.

Horace Greeley on Patents and Copy Rights.

"Sir Walter Scott barely escaped dying a bankrupt, when one cent per volume from his American readers would have saved him from pecuniary embarrassment, smoothed his downhill of life, and perhaps enabled him to live longer and write more and better. I wish we had rendered him naked justice.

As to the abolition of the Patent system, which has of late been influentially advocated, I shall be more easily reconciled to it [illegible] be swiftly followed [illegible]hts of property [illegible]of all legal [illegible]h rights. [illegible]all re- [illegible]ld,

Chemistry of the Stetefeldt Chloridizing Roasting Furnace.

Written for the Mining and Scientific Press.
BY G. KUSTEL.

The mechanical part of the roasting of silver ores in Stetefeldt's furnace is so simple that the whole manipulation is explained in a few words. The principal point is the maintenance of a uniform fire in two fire-places, and a certain degree of pulverization. The ore must be carefully mixed with salt of equal fineness, which best accomplished by crushing the ore together with the salt. The hopper is continually charged with the pulverized ore. The feeding is done by machinery, with great precision, by an improved arrangement.

The chemical proceeding of the chlorination is very interesting. At the first glance it would seem that, considering the short time of two seconds in which the falling ore is exposed to the flame, a perfect chlorination could not take place, especially if compared with the known facts apparent in the common roasting furnace—that is, that sulphurous acid is first formed under influence of a dark red heat, by aid of the oxygen of the air, while the metal, deprived of its sulphur, becomes an oxide. The oxygen of the air and of the oxide act on the sulphurous acid, converting it into sulphuric acid, which again combines with the metal oxide to a sulphate. The sulphate reacts now on the salt, setting the chlorine free, and the formation of chlorides begins.

This reaction and transformation requires time, which is not offered in Stetefeldt's furnace; but the chlorination is effected nevertheless, and very perfectly, with less salt, and in a few seconds. The chemical action in Stetefeldt's furnace is as follows: As soon as the ore enters the furnace, each sulphuret particle ignites, being surrounded by a glowing atmosphere; evolving at the same time sulphur, which, in presence of atmospheric air entering undecomposed through the grates, is converted into sulphurous acid, and the metal into an oxide. In contact with ore particles and oxygen, the sulphurous acid becomes sulphuric acid. This acid does not combine with the metal oxide to a sulphate, as is the case in a common furnace, or if so, only to an insignificant degree, on account of the temperature, which, nearly from the start is too high. The sulphuric acid therefore turns its force directly against the glowing salt particles, setting free the chlorine. All these reactions are, so to say, in *statu nascenti*. From the burning fuel some steam is present among the gases, giving rise to the formation of hydrochloric acid. The whole space of the furnace is then filled with glowing gases of chlorine, hydrochloric acid, sulphuric acid, sulphurous oxygen, steam, and volatile base chlorides; all of them acting de- and composing on the sulphu- les with great energy. The ses the sulphurets direct- of metal and chloride ses and combines hates. The hy- e. The sul- salt and oxygen and

San Francisco:

Saturday Morning, July 10, 1869.

Notices to Correspondents.

Crystal.—Professor W. K. Sullivan found that crystallized gypsum heated with water in a sealed tube to a temperature of 150° Centigrade, lost part of its water, and formed the hydrate 2 (Ca O SO_3), + HO; when beated for several hours at a temperature of 200° C., tbe gypsum became completely dehydrated. Several of the zeolites, beated under similar circumstances, were also dehydrated, but required a much bigher temperature and a much longer exposure to heat than required to dehydrate gypsum.

Tide Mills, Humboldt.—By the estimation of Bessel, 25,000 cubic miles of water, flow every six hours, from one part of the earth to another. The mechanical force so exerted diminishes the amonnt in store by a like quentity at every tide which is converted into heat, and thus adds to the temperature of the globe.

J. H.—The influence of the Gulf Stream on the climate of Ireland generally, but its S. W. coast particularly, is such that the arbutus flourishes as well there as in the uorth of Spain and Portugal; and Dr. Lloyd of Dublin reports as the resnlt of a series of day and night experimonts, that the temperature of the sea off the west coast of Ireland is four degrees higher than the mean temperatnre of the adjoining land.

Peuruddock, Silver City.—The decpest mine in Cornwall in the year 1857, was the Fowey Censol's copper mine. At that time it was 328 fatboms (1,968 feet) deep from the surface, and 298 fathoms below the level of the sea. At the same period it was calculated that all the levels on the course of the lodes amounted to 153 miles. Of the cross courses or levels N. and S., twenty-two miles, and of the shafts, seven miles, or a total of underground workings aggregating 182 miles.

Another Manufacturing Establishment Burned Down.—The Pacific Wood Preserving Co's works, northwest corner Ritch and King streets,—usiog tar to inject into the fiber of wood, and whose business operations were just beginning to he very extensive and promising,—have this week met the misfortune of the Pioneer Fuso Factory of last week—total destruction by fire caused hy the uuusually combustible material employed. Origin: the bursting of a retort, which let the tar into the furnace. Loss, $20,000, without insurance. Great castings for this company were noticed by us in connection with the Vulcan Foundry several weeks ago. Very little delay will be occasioned before the uew apparatus will be set up in working order. Sand reservoirs are to be provided, so that in case of a similar accidèut the fire can at once be smothered.

Numerous elegant dwellings are being erected at Shermantowu.

METALLURICAL.

Milling.

Amalgamation with the varied and excellent California foundry improvements and attachments thereto, is usually comprehended under this misused word, which is properly to be regarded as the popular coinage responding to a demand for some handier word than "beneficiating," or "*zugutemachen*"—in which it seems the French, Spanish, and German langnages are as badly off as the English. "Milliug" would be an excellent word if beneficiating or amalgamating were purely mechauical, as is the case with free gold. Where chlorides are first formed, and iron or copper come into play under fixed laws of chemical eqnivalents, "milling" should not be a mere working by recipe as bousewifely girls are wont to do in baking a pie; yet such is too generally the signification and the practice.

"A. B.," a Ceutral City, Colorado, correspoudent, writes:

"I notice in the Mining and Scientific Press various kinds of machinery for working silver ores. If it is not asking too much, I sbonld be pleased to receive from you your opinion as to the best mode of working what is termed refractory silver ores; the best crusher, the best pulverizer, what amalgamator is considered the best in your country; also roaster, etc."

From every quarter the word comes that this subject is of an importance above all others, even to the existence of entire settlements; and invariably it is the *cost* and *percentage* to be obtained, that presents itself to tho science of the practical metallurgist. Good resnlts, where the results are bullion, call for the keenest practical intelligence and enlightenment with all the aids of the books and of new experiments that are to he bad. "Our greatest need," says the Portland *Oregonian*, "in connection with our vast mineral resources, is that kind of knowledge that will enable us to work our mines with the largest profit; aud for the want of this many mines are abandoned which in Europe or elsewhere would be worked with success."

"What we want," says the Austiu *Reveille*, "is some cheaper way to work our ores. Until this desideratum is attained, no exteusive mining need he expected in this portiou of the State. Forty-five dollars a ton for crushiog and amalgamating, with twenty per ceut. deducted from the pulp assay, together with the bullion tax, brings the price of milling our ores to such a figure that an embargo is virtually laid on every ton of ore the pnlp assay of which is less than $100 per ton."

The cost of working ores and the percentage of bringing-out vary so greatly in different regions aud on different ores, *depending always upon their mineral composition and gangue*, that it will, of course, be impossible to reply to "A. B.'s" inquiry in a general way. Weekly repetitions of data of cost, from everywhere, are to be found under "Mioing Summary." This varies from $3 to $50 per ton iu amalgamation and wet extraction, the tools depending always upon what is sought to be done, or the process. If coarse pieces will do, as in smelting, the jaw-crusher is best; if it must bc fiuer, the rollers; if pulverulent, the stamp mill, or somo of the grindiug machines or paus. Varuey's pans will take ore from a quarter-iuch screen and deliver it, fully prepared, to his amalgamating pans. Hephurn's new grinder and amalgamator will take ore from a three-eighths of an inch screen, and grind and amalgamate it in about tho same time as the usual pans do from a No. 6 screen. Hunt's grinding cylinder will take ore from a quarter inch screeu, and griod it to impalpable powder iu the timo usually taken to do the same in pans, but mnch more regularly.

To reduce from coarse to fine, a crusher, rollers and stamp mill (or grinder, depending upon the harduess and brittleness of the ore and gangue,) may follow each other. To do *all* economically, nothing but the stamp mill has thus far answered. Howland's circular stamp mill is a well-devised modification, having tbe advantage of compactness for transportation and extreme simplicity,—described in the Press of March 6th, 1869. Wbere jigging is not practiced for concentration, rollers are of less importance. Probably no one thing conld be mentioned that would do more towards making low-grade ores pay good dividends in this country than the introduction of improved sieve concentration processes, practiced in all older mioing countries, on the principle of the Coruish "jigging."

By the Hepburn pan, supplied with thirteen sliding disks, it is claimed that $7 and $8-ores can be worked at a profit—at a cost of $3 per ton—the large amount of exposed ruhbing surface being the cbaracteristic feature, and having the quicksilver so arranged underneath as not to he mechanically floured by grinding. Two tons, we are told, can be worked at a charge witb two-horse power.

This appears to be the best of the grinding pans; it is adapted for use after crushers that reduce to hickory-nut size, on ores that amalgamate easily raw, without preliminary chloridizing, and where scarcity of water renders dry crushing preferable.

Dry amalgamation by the Paul & Woods process has run for a sufficient time now to be pretty satisfactorily tested; and Mr. S. A. Chapin of the Twin mill, Silver City, N. T., certifies that he obtains ninety per cent. where in the ordiuary pan there could be obtained only sixty per cent. This is the simplest of all processes. Dry pulp (1,000 pounds), is iutermingled with one-third its weight of quicksilver in an iron harrel 38x48 inches, for four hours, under moderate warmth—less than the vaporizing degree—at twenty-six revolutions per miuute. So very miuutely is the quicksilver found to be mixed with the pulp that it is not perceivable with the naked eye, yet by simple agitation in water it is settled and collected without difficulty, according to the statement. Theoretically, neither ore nor quicksilver is wasted. It is alleged that sulphuret, antimouial iron, lead and copper ingredients, do not interfere, but stand by and see fair play; though it would seem that chemical decomposition and re-affiliation must include in the play some of the base metals, or there is something very mysterious done iuside of this iron barrel. After further trial, we shall probably learn that the process is most favorable to certain ores or combioations of ores and gangues in places where there is little or no water.

Smelting.

Whatever processes may be best suited to locality and circumstancos where the ores are fahl-ore, grey copper, stetefeldtite, or the red and black antimonial silver minerals, for which modified amalgauation is generally practiced, and is in most cases the cheapest; for the sulphurets, carbonates and oxides of lead and copper, or ores containing more than fifteen per cent. of those minerals, there need be no hesitation about pronouncing in favor of smelting. There are wet copper extraction processes—like that tried by Ramdohr at Virgiuia City—adapted to low-grade ores for copper alone, which is brought into solution as sulphate, aud precipitated by "iron spouge;" bnt wet copper extraction on low-grade ores does not appear to be thriving at present anywhere hut on the Rhine.

Many ores have heeo pronounced smelting ores ou this coast which can bc successfnlly and more economically treated by other methods. Because ores are "refractory" with quicksilver under unskillful hauds, it is not necessary to conclude, therefore, that smelting will bc necessary.

Are there any smelting ores at White Pine? There have been formed six or eight smelting companies on that supposition, answering the question iu the affirmative. But without ores richer than the carbonate of lead found there, and without water to concentrate, tbe task, it would seem, should not be hastily undertaken. The base metal ores there generally contain more than fifty per cent. of lime or quartz, or other earthy material. The "smelting process" ougbt certainly not to be held responsible for failure in smeltiog raw ores of such a character—unless the veritable nuiversal flux could be taken advantage of. A proper slag,—from singulo to bisilicate,—is, of course, of the first importance; involving precisely the same principles and method of procedure, chemically, as solubility in the wet way, and being based on a similar relationship of the alkaline to the acid ingredients—of lime to quartz in this iustance, the chemistry by fluidity of fire being qnite the same as by water. What makes smelting difficult is, that no recipe can be given for it: the smelter should be aware at every step of what he proposes to effect.

The cost of smelting at hest is not a trifle—is more likely to be above $75 to the ton than less; *vide*, our reports of Belshaw, Desmerenx, and Aaron's results at Lone Pine. Stetefeldt, at Eureka, Nev., could not do it for less than $80. Calculations must not be based on small and favorable samples. The following table, made by Frederick Brunckow, a practical engiueer (subsequently killed by Mexicau robbers), sbows that where labor was cheap, smelting still cost $89.92 per 3,000 pounds =$60 per ton. The comparative figures of patio and barrel amalgamation are sufficiently striking. It is a statement of the cost of reduciug 3,000 pounds of silver ore by processes adapted to the several kinds, at the Real del Monte Company's reduction establishments at Sanchez, Velasco, San Miguel and Regla, Mexico, in 1854; the average yield of the principal ores being $800.

At Sanchez, Velasco, or San Miguel, the Barrel Process is used; at Regla the Patio amalgamation and smelting.	BY BARREL AMALGAMATION AT			*Bypatio Amalgamation at Regla*	*By Smelting at Regla.*

Ramie and Kindred Textile Substances will he nnder consideration this (Saturday) evening, before tho Polytechnic Society of the Mechanics' Institute,—a paper having been prepared with care and with the advantage of some experience, by Dr. Silver,—wbile membors or visitors who have experience or information on the subject of textile fabrics, will probably add to the interest of the bearings of that important subject.

"Las Minas" furnishes somc notes of miues on Treasure Hill, which will appear next week.

Another Test of Barlow's Anchor.

On Thursday last a number of nautical gentlemen and others connected with the press, were invited to witness, from the steam revenue cutter Wyanda, a trial of the new anchor lately invented by Mr. E. T. Barlow, of this city. The Collector of the port having kindly given permission for the use of that vessel for the purpose, she steamed out to a locality in the Bay just beyond the Dry Dock, where the anchor was let go in the soft mud, holding the steamer firm to her place, against a strong wind, acting in conjunction with the tide. After holding awhile, the steamer was backed, at a rate of 50 revolutions of the screw a minute, under which tension, the anchor dragged in the soft mud; but again held her fast as soon as the engine was stopped. The anchor was then taken up, and again let go at a point near the Potrero shore, just beyond Long Bridge, where the same results were obtained.

Some idea of the holding capacity of this anchor may be formed from the fact that it weighs only 595 pounds; while the smallest anchor, of the ordinary construction, employed on board of this cutter, weighs 1,400 pounds—she being a ship of some 300 tons, new measurement. This anchor is quite novel in its construction and appearance, having no stock, while the shank consists of two parts, sliding upon each other, and held in place by two pivots, one at the ring and the other at the crown. It is so arranged that both flukes take the ground, instead of one. It is by the application of this principle that the inventor is able to dispense with about half the weight of iron to secure the same holding power obtainable from the common form of anchor.

There can be no doubt whatever of the great superiority of this anchor on small vessels, say below 800 or 1,000 tons. Experience alone must determine its success, when heavier masses of iron are put into this shape for holding larger ships. What has already been demonstrated renders it a matter of earnest desire with many, that the anchor should be submitted to a thorough trial, under all conditions and for the largest class of vessels. If an anchor can be made with one-half, or even one-quarter the metal now employed, to render equally effective the present form of anchor, the fact is one of great commercial importance. The Admiral commanding the Navy Yard, and other officers of the navy, have at a previous trial, pronounced this better than an ordinary anchor of equal weight. It was the testimony of Capt. Bailey commanding the Wyanda, and the nautical gentlemen present at the trial on Thursday, that Mr. Barlow's anchor, which in this instance weighed 598 pounds, was fully as effective as one of the ordinary make, being 1,000 pounds. In view of these facts, and this testimony, we trust that some one will have the enterprise and energy to put a little capital against Mr. B's ingenuity, and hereby possibly introduce a new, efficient and economical anchor, and in so doing, secure a future for themselves.

Lectures by Miss Dickinson.—Lovers of popular lectures will receive the announcement of the course of lectures in this city by Miss Anna E. Dickinson with pleasure. The great interest which has invariably been manifested in her speaking throughout the Atlantic States, has created a strong desire in the minds of intelligent people of this coast to listen to her celebrated lectures. We shall expect to see crowded houses, and from our own experience we are quite sure that all who attend will be richly rewarded for their presence. Miss Dickinson is an earnest friend of the mental and physical welfare of the working classes, and speaks in an independent manner of their rights and follies. The subjects of her first course are as follows: Monday evening, "What Next;" Wednesday, "A Struggle for Life;" Friday, "Nothing Unreasonable."

New Books.

The New West, or California in 1867-8, by Charles Loring Brace. New York: Putnam & Son. 12 mo. pp. 373.

Mr. Brace has a wide personal acquaintance as a working philanthropist, and is not only a very amiable person but the author of a number of works of excellent quality and possessing a tone that seems to agree well with the man; such as "Home Life in Germany," "The Races of the Old World," "Hungary in 1851," etc. In this book he has used his own traveler's sense, and good taste, with all the aid of existing published information regarding our resources, in giving his own impressions touching such questions as have a bearing upon the problem of making in rural California a home. To old residents even, the work contains much suggestive matter, as it discusses many questions brought to a more practical issue in our midst since the completion of the Pacific Railroad, though containing in the main matter that has been seen by most readers in another shape. Some of the more original chapters are on "The Effect of Climate on Race in California," "Where to Settle in California," "Professional Robbers," "The Chinese," etc.

Bancroft's Guide for the Pacific States, for travellers by railway, stage, and steam navigation; comprising routes and modes of travel, distances, fares, descriptions, maps etc., etc.

To live in the blessed 19th century, the age of inventions and communication by steam, is not to exist within one narrow horizon for half a life-time without a break; but steam having given us wings, we are like birds of passage and flit whither we list, for pleasure or profit; and we know and enjoy, in consequence, very much more than has been possible to our good grandfathers. The railroad and traveler's Guide Book has become as great a necessity as the Bill of Fare, or the Market itself. Bancroft & Co., the enterprising publishers, (who keep a sentinel on the watch for every new demand from our roving and prospecting constituents,) have just published a new guide under the above title, of the size and appearance of Appleton's Railroad Guide,—of Bradshaw, and all the French and German railroad publications,—pp. 137, containing time tables, maps, etc., which strike every old Californian especially who aims to inform himself constantly of the resources and growth of surrounding or distant sections, as exceedingly well worth having. So easy is it to travel, and to see for one's self in 1869, that nothing but a complete guide has been wanting, for a person casually thinking of any heretofore inaccessible point, to wish himself there and to be there without further ado. The price is 50 cents.

Practical Specifications of Works, executed in Architecture, Civil and Mechanical Engineering, Road-making and Sewerage; to which are added a series of useful agreements and reports. By John Blenkarn, C. E. and architect. Philadelphia: H. C. Baird. 1868. 8 vo. pp. 416.

Projectors of promising and important enterprises are not always wide-awake as to the financial details essential to the beginnings of carrying out. Here lies the wide gap between all the fine plans that are conceived, and their execution. There exists, accordingly, a class of more practical and less presuming engineers, who are sometimes called contractors and sometimes boss laborers, and whose care and specialty it is to be clear on all questions of cost, and specification in detail. The present work is intended to assist engineers and architects with examples and methods chiefly of specifications accompanied by plans, in the acquisition of such all-important practical points in the business of an engineer in full reputation and activity, as could otherwise be acquired only by many years' of experience.

Coal.—At the Bellingham Bay coal mines machinery has been set at work to pump the water out, which will take to the 1st of July. The machinery throws out about four tons of water per minute.

A new discovery of coal has been made in Snohomish County (W. T.), which prospects well.

The "Avitor."

Very warm and hopeful things are said in favor of F. Marriott's aerial machine, by those who went out to witness the several tests made last Sunday—which make us regret that we did not avail ourselves of the opportunity to be amongst the number.

Among other notices given by the reporters of the San Francisco daily press, we quote the following from the *Times* of Monday:

The day was beautiful, but unfortunately the strong wind which prevailed prevented as thorough a trial as was desired. But the inventor, Mr. Frederick Marriott, of this city, who has been at work for eighteen years on the subject of aerial navigation, has now the proud satisfaction of standing where Fulton did when he made his first steamboat. He has secured, beyond doubt, a firm foundation around which inventors of all civilized nations will cast their offerings of improvements until the air will be traversed by men as safely as it now is by the birds. The problem is solved—aerial navigation is no longer a question of doubt.

The Aerial Carriage.

The carriage, which is merely a large working model, is a balloon, shaped liked a cigar, both ends coming to a point. It is 37 feet long, 11 feet from top to bottom, and 8 feet in width. These are the measurements at the center of the balloon, from which point it gradually tapers off toward either end. Around the balloon lengthwise, and a little below the center, is a light frame work of wood and cane, strongly wired together and braced. Attached to this frame, and standing up as they approach the front of the carriage, are two wings, one on either side. They are each five feet wide at a little back of the center of the carriage, and do not commence to narrow down until they approach the front, where they come to a point. These wings are made of white cloth fastened to a light frame work, which is braced securely by wires. The main frame is secured in place by means of strong ribbons which go over the balloon and are attached to corresponding portions of the frame on the other side. To the frame at the hind part of the carriage is attached a rudder or steering gear, which is exactly the shape of the paper used in pin darts, four plans at right angles. This, when raised or lowered, elevates or depresses the head of the carriage when in motion; and when turned from side to side guides the carriage as a rudder does a boat. At the center and the bottom of the balloon is an indentation, or space left in the material of which it is built, in which the engine and machinery are placed on frame work. The engine and boiler are very diminutive specimens, but they do their work handsomely. The boiler and furnace are together only a little over a foot long, four inches wide and five or six inches in hight. Steam is generated by spirit lamps. The cylinder is two inches in diameter and has a three-inch stroke. The crank connects by means of cog-wheels, with tumbling-rods which lead out to the propellers, one on either side of the carriage. The propellers are each two bladed, four feet in diameter, and are placed in the frame work of the wings. The boiler is made to carry eight pounds of steam. When not inflated, the carriage weighs eighty-four pounds. The balloon has a capacity for 1,360 feet of gas. When inflated and ready for a flight it is calculated to have the carriage weigh from four to ten pounds.

Public Trial Yesterday.

The 8:30 A. M. train to San José, yesterday, carried to Shell Mound about 100 invited guests to witness the public trial of Marriott's Aerial Carriage. On arriving at the scene the Avitor works were found with door open and the carriage just coming out into the open air. The wind was blowing quite hard, and coming in gusts it was found that it would be impossible to have a satisfactory trial out of doors. By holding on to the guys and frame work in this wind caused the carriage to be severely strained, and finally it was taken back into the works. The room where it was built is quite large, resembling in construction the Mechanics' Pavilion in this city. Steam was raised and the carriage, obeying its propellers, raised several feet from the floor and started forward at rapid pace. Persons having the guys in hand stopped it at the end of the hall, and turning it around it sailed back. The party congregated cheered heartily. But the trips were not satisfactory to those having it in charge, and on looking the balloon over they found that it was leaking quite badly. It was taken to the pipe leading to the gasometer and the process of filling it up and stopping the leak was commenced. When ready and moved out for a start a large rent occurred at one of the seams near one of the propellers. This was sewed up and made tight, but on refilling the balloon, it gave way several times. Finally, about half past one P. M., damages were repaired and the carriage moved off for another trial. This time it was a complete success. While yet the machine remained, as it were, perfectly dormant, resting upon the floor with less than sufficient buoyancy to raise itself—requiring additional aid to relieve it from connection with earth—the machinery was put in motion and the propellers commenced their revolutions. *At once life was imparted to the whole body*, and it arose promptly and gracefully and took its flight into the air under guidance of the rudder, thus establishing the astounding fact that it had power and could fly; and giving proof that the grand problem had been solved. The carriage mounted nearly to the roof with a firmness and steadiness equal to the movements of an ocean steamer upon smooth water. The guests cheered long and loud, and many fairly danced with delight at the success. The trip back and forth was performed several times with the same success. Finally the carriage was taken out into the open air and held while several photographs were taken.

"As to the shape of the model (writes a correspondent of the *Herald*), just imagine a large and very thick cigar, thirty feet long and fifteen in diameter. From the bottom, and midway, there is a large open cut, in the shape of a V, running up to the center. The boiler is placed in the lower part of this cut, and the engine a little above. A light wooden rib encircles the balloon lengthwise, and divides it into two equal parts. From the head there are two wings of light cloth, in the shape of a jib, attached to the rib and held extending horizontally by a frame. These wings extend beyond the cut, and their breadth is then increased to about five feet. A propeller in the center on each side, about four feet in hight, within and at right angles, with the wings, is worked by the engine. The rudder is five feet long. It is formed, as we might say, of four cloth rudders attached together at right angles, longitudinally."

The editor of the *Transcript* says: "The model possessed a gas capacity of 1,360 feet, and a total weight of 80 pounds. The gas supply was insufficient to raise the Avitor from the ground; but as soon as the little engine started the propeller, the machine lifted itself from the ground, and gracefully commenced its flight through the air. It was kept from going out of sight by two cords attached to it in the hands of persons on the ground. Its motion was regular, and without any of the swaying which might naturally have been anticipated, and its speed, with 90 revolutions of the propellers to the minute, was between four and five miles an hour. The rudder acted well, guiding the air-ship perfectly."

A company has been formed, comprising the names of a number of well known and substantial citizens, for the purpose of constructing a full-sized aerial ship.

Steps have already been taken to protect the inventor's rights, through the agency of this office. We expect to say more of the Avitor soon, and publish an engraving of its appearance on an aerial voyage.

A Silver Plated Locomotive.—The locomotive "America," built at Patterson, N. J., in 1867, and sent to the Paris Exposition, has been brought back to New York, and purchased by the Rock Island Railroad Company. An exchange says it "will open the route to Omaha. An effort will be made to take it through to San Francisco. This locomotive is the finest specimen of workmanship of this kind ever manufactured in the country, and cost $60,000. The boiler is silver plated, the smoke stack of German silver, and the engine house inlaid with hard wood. The tender is beautifully veneered, the word "America" being set in different varieties of wood letters. All the bright work is splendidly polished, the bell, whistle and dome being heavily silver-plated."

Scientific men say that the time of the diurnal revolution of the earth is gradually being shortened on account of shrinkage of the earth by cooling in the interior.

The Humboldt Mines, Nevada.

Our business agent writes as follows of some of the mines in Humboldt County, Nevada:

Unionville is about twenty miles from Reese River, in Humboldt County. It is a fine, thriving and prosperous town, with three quartz mills running night and day. The first one as I approached was that belonging to the Silver M. Co. This mill now has five stamps in operation, but will soon add five more. The superintendent, Mr. Stewart, informs me that the rock is paying very well—from $35 to $160 to the ton; while there is some that pays much better by shipping to Europe for reduction. Of this they are sending off large quantities every few days. It is black and full of sulphurets, yielding all the way from paying rates to $1,000 per ton.

Fall's Mill.

The next mill reached was Fall's, which is running ten stamps and doing well. This company has a new engine on the ground, which will be running in a few days. Times are lively here, and there is water enough to make power for running fifty mills with large stamps; but fuel is very scarce. Mr. Fall has been using sage brush, and has teams constantly employed in hauling it to the mill.

Placer Diggings

have been struck six miles from this camp, where two companies are working, with results of from $4 to $6 per day to the hand. They have plenty of water.

The Arizona Mine

is about two and a half miles from Unionville, up the cañon, and on the side of a very precipitous mountain. The company has a very fine ledge, from four to ten feet thick. Through the kindness of the superintendents, Messrs. Ross and Brackett, I was shown through the mine, which is owned by the company that has the mills at Unionville. There is a tunnel 400 feet long, with drifts running south and two chutes running up to the top of the hill. I could see an abundance of native silver and chloride all through the white quartz.

Mr. Stewart has some thirty men employed, and Messrs. Fall & Co. have thirty-four in the mine, working day and night. The ore is very rich. One of these companies own the original mine, and the other is an extension of the same, south. The two companies use the same tunnel for bringing out their ore, which is hauled to the mill by oxen. There are, no doubt, many other valuable mines in this neighborhood, which will eventually be brought to light by some industrious prospectors.

A Sulphur Mine.

Mr. Spence is opening a sulphur mine near the Humboldt House, and about 800 feet from the C. P. Railroad. He is now down about 28 feet, and it is expected that the company with which he is connected will fit up refining works at an early day. The deposit is a very promising one.

Ayer's
Hair Vigor,
For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a
HAIR DRESSING,
nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.
Prepared by Dr. J. C. Ayer & Co.,

F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.
OFFICE, 506 JACKSON STREET,
GENERAL DEPOT:
Corner of Jackson and Montgomery streets.
This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the venous circulation.
It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.
California Vichy Water is used with success in many cases, such as—
Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the Indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.
(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.
PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.
Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

FOR THE WEEK ENDING JUNE 22D.

MEAT-CUTTING MACHINE.—Jas. G. Divoll, Sonora, Cal.—91,526.

This invention relates to an improved apparatus for cutting or chopping meats, in order to reduce them to sufficiently small pieces to be fed into a machine for grinding it into sausage meat. It can also be used for cutting any vegetable substance which it is desired to reduce in size. It consists of two eccentric knives, operated by proper mechanism inside of a closed case or box, in which the meats or vegetables to be cut are first placed. The box is arranged to move back and forth, so that the knives will cut from side to side, thus bringing every portion of the substance to be cut under their action.

WATER-CLOSET VALVE.—W. Smith, San Francisco, Cal.—91,574.

LETTER-BOX.—Fred. Wittram, San Francisco, Cal.—91,583.

ORE-WASHER AND CONCENTRATOR.—Wm. G. Heslep and Thomas A. Cochrane, Jamestown, Cal.—91,627.

This invention is illustrated and fully described on the first page of the present issue.

MINING SLUICE FOR SAVING SULPHURETS. Orlando Jennings, North San Juan, Cal. 91,638.

This invention was fully illustrated and described in our issue of April 24th.

GANG-PLOW.—J. W. Lewis, Oregon City, Oregon,—91,643.

ROLLER-CUTTER FOR PLOWS.—J. W. Lewis, Oregon City, Oregon.—91,644.

COMPOUND FOR SALVE.—Nicholas Lumsden and Frank Lessman, Oakland, Cal.—91,647.

ELLIPSOGRAPH.—Andrew Smith, Dayton, Oregon.—91,681.

POCKET KNIFE.—Addison G. Waterhouse, San Francisco, Cal.—91,693.

STEP-LADDER.—Charles Edward Boman, San Francisco, Cal.—91,706.

DEVICE FOR TREATING HIDES.—Herman Royer, San Francisco, Cal.—91,772.

The above invention consists of a rare device for converting hides, in their raw and rough state, into leather, suitable for belts, lacings and other purposes, and is an improvement on a machine for which a patent was issued to the present patentee and his brother Louis, May 12, 1868. The invention consists in a device by which the hides, when properly secured in it, may be twisted each way, back and forth, until it becomes soft and pliable, without injury to the texture; thus rendering the hide so treated capable of being used for many purposes for which tanned leather is ordinarily employed. By the use of this device the operation of preparing a raw hide in the manner indicated is readily, easily and quite perfectly accomplished.

SEAT FOR VEHICLE.—Samuel S. Simmons, Watsonville, Cal.—91,779.

Every person is a benefactor to his race who eases the jolts and jars to which we are liable to be subjected. It is usually considered one of the "pleasures" of life to be rolled "gently along" a rough road in some wheeled vehicle, and thus be moved from place to place without violent exercise. This is true when we ride in a carriage borne upon yielding springs. But when we attempt to make the passage in one of our lumbering farm wagons, the exercise is often a little more than the rider bargained for. This invention is intended to ameliorate affairs by providing an easy seat for the driver, as well as for others in the wagon, and is especially applicable to sulkies and gigs. The seat is mounted on an oscillating frame, and is held in an upright position by springs placed on each side, at its lower end, which allows the seat to move from side to side, and permits the driver to maintain it in a vertical position at all times. Springs are also arranged so as to allow the seat to have a forward and backward motion, thus rendering it much easier for the driver than where the seat is fixed. It also consists in providing movable or adjustable stirrups for the feet of the driver, with which he can more readily accommodate himself to the movements of the vehicle.

FOR THE WEEK ENDING JUNE 29th.

MACHINE FOR KYANIZING WOOD.—David W. Hunt, San Francisco, Cal.—91,848, antedated June 22d, 1869.

FLUX FOR SMELTING ORES OF GOLD, SILVER, AND OTHER METALS.—Chas. W. Moore, San Francisco, Cal.—91,862.

AMALGAMATOR.—Geo. Stevens, San Francisco, Cal.—91,878.

DUST-DEFLECTOR FOR RAILROAD CARS.—J. P. O. Lownsdale, Portland, Oregon.—91,947.

PROCESS OF ROASTING AURIFEROUS SULPHURETS.—Wm. Bruckner, Central, Colorado Territory.—92,009.

SUBMARINE FOUNDATION.—Wm. H. Foye, San Francisco, Cal.—92,033.

STEAM ENGINE GOVERNOR.—William H. Howland, San Francisco, Cal.—92,051.

STEAM ENGINE VALVE.—William H. Howland, San Francisco, Cal.—92,052.

GANG PLOW.—William B. Rice, Oakland, Oregon.—92,099.

The above list of patents will be noticed next week.

Foreign Patents for Pacific Coast Inventors.

Frederick Gutzkow, of San Francisco, Cal., has made application for a British patent on his "Process for preparing sulphurets and obtaining pure silver therefrom," through the London agents of the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Number of application, 1868 of 1869.

British Patent No. 762 of 1869 was sealed June 15th, granting to William Babcock, of San Francisco, Cal., a patent for "a new or improved preservative paint or composition for protecting ships' bottoms, preserving submarine wood-work, and other useful purposes." This is the paint compositiou for which a United States patent was recently issued to Henry Roundy, of this city, through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. The paint is now being manufactured in this city by the California Marine Metallic Paint Co.

ADDRESS WANTED.—We are desirous of communicating with Allen Oliver, lately of Jamestown, Tuolumne County, California. tf

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m R. F. HOWLAND.

DR. HALL has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Carling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Dewilz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to newcomers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco. 21v18 3m

Cholera—How to Cure It.—At the commencement of the diarrhœa, which always precedes an attack of the cholera, take a teaspoonful of the Pain Killer in sugar and water (hot if convenient), and then bathe freely the stomach and bowels with the Pain Killer clear. Should the diarrhœa or cramps continue, repeat the dose every fifteen or twenty minutes till the patient is relieved. In extreme cases two or more teaspoonfuls may be given at a dose. The Pain Killer, as an internal remedy, has no equal. In cases of Summer Complaint, Dyspepsia, Dysentery, Asthma, it cures in one night by taking it internally, and bathing with it freely. Its action is like magic when externally applied to Bad Sores, Burns, Scalds, and Sprains. For Toothache, don't fail to try it. In short it is a *Pain Killer.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

REDINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents. jy1m

SUISUN CITY, Cal., June 26, 1869.

MESSRS. DEWEY & CO:—This is the third time you have presented me with Letters Patent within twelve months. Gentlemen, you have done all I have asked of you—you have been honest; you are men that an inventor can rely upon for doing business for him, and be need not fear of being swindled or wronged in any way. I would give you business to do in your various departments in preference to any one else. Many thanks to you for your success. You have obtained valuable patents for me, and I appreciate your kindness, your honesty, ability and success. Yours, RICHARD KNOTT.

To News Agents.

From July 1st, 1869, News Agents desiring five or more copies weekly of the MINING AND SCIENTIFIC PRESS, will be furnished direct from the office, at a reduced price from former rates. Orders for a less number can best be supplied through San Francisco wholesale agents.

A NEW Gold Metal.

THE GOLD METAL WATCHES

Now being introduced by

C. E. COLLINS & CO.,

No. 629 Washington Street,

SAN FRANCISCO,

Surpass anything yet made in the way of an Imitation Gold Watch. They wear well, and keep good time.

The Ladies' Watches cost $8 and $10 each.
The Gentlemen's cost $15 and $20 each.
Chains, from $3 to $6 each.

RECOMMENDATIONS:

SAN FRANCISCO, May 12, 1869.

This is to certify, that I have carried one of the small size Gold Metal Watches which I got of C. E Collins & Co., and I find that it runs as well, and keeps as good time, as any watch I ever carried, and I can therefore recommend them. I am engaged on the Sacramento steamer "Chrysopolis." C. A. COLBY.

I am engineer on the San Jose Railroad. I have been carrying one of C. E. Collins & Co's watches for about one year, and I can safely say it is the very best watch for time that I have ever seen. GEO. CORNWALL.
Engineer on the San Jose Railroad.

MESSRS. C. E. COLLINS & CO:—Having heard your watches spoken of in the highest manner, I have resolved to order one for myself. You may send me one of the Lady's $10 watches, without the chain. Send it as soon as possible, as I am very much in need of a time-piece.
R. B PATTEN,
Toano, C. P. R. R.

The public are cautioned against buying their watches at high prices, as many of them are sold for genuine *Gold Watches*, at from $100 to $150 each.

For List of Prices and Description of Goods, send directly to us. Can be sent by Express to be paid for on delivery.

C. E. COLLINS & CO.,
No. 629 Washington street, San Francisco.

P. S.—Where six watches of the above are ordered at one time, we will send one extra, free of all charges.

We also deal in the finest Gold and Silver Watches, Watch Materials, etc. Send for circulars or prices.
26v18-4t

Pacific Mail Steamship Co's
STEAMSHIPS FOR
NEW YORK, JAPAN AND CHINA.

Connecting with ARIZONA, Capt. Maury.

Passengers berthed through. Baggage checked through. One hundred pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets to Liverpool by the "Inman" and "National" Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship GREAT REPUBLIC, Capt. Cavarly, will be dispatched for YOKOHAMA and HONGKONG on SATURDAY, July 3d, 1869, at noon connecting at YOKOHAMA with the steamer NEW YORK for SHANGHAI. Shippers of freight to China or Japan are requested to mark on each package its destination.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

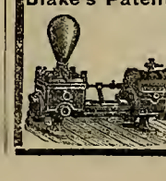
OLIVER ELDRIDGE, Agent.

THE BEST WEEKLY IN AMERICA.

MOORE'S RURAL NEW YORKER,

The largest, best and cheapest RURAL, LITERARY and FAMILY WEEKLY, in the world, enters upon a new Half Volume July 3, and hence *Now is the Time to Subscribe!* Sixteen five-column pages. Employs the best talent. Finely and profusely illustrated. For example, see the splendid full page group of GEN. GRANT'S FAMOUS HORSES, in No. for July 3d. Adapted to the whole country. Combines Ability, Variety, Taste, Spirit, Progress and Usefulness. Circulates all over the Continent, and now reaches the Pacific States in a week from date. Is not only a superior literary and Family Paper but treats fully and ably upon Rural and Domestic affairs, Science, Art, etc. Try it, and you will find that "Moore's Rural" is (as both Press and People say), the Best Weekly in America. Only $3 a year—$1.50 for half. Ask your P. M., or address D. D. T. MOORE,
1v19 2t 41 Park Row, New York.

Blake's Patent. THE BEST PUMP for Boiler Feeders, Breweries, Sugar Houses, Tanneries, Mining and Fire purposes, etc., is Blake's



Patent Steam PUMP

It is SIMPLE, COMPACT and POWERFUL, needs no expert to run it, and will start at any point. Is warranted positive under all circumstances. Send for a circular. W. O. M. BERRY & CO., 114 California St., San Francisco, Cal.

Company Transactions.

ELECTROTYPE ENGRAVINGS, CUTS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State

THE CROPS.—The Tuolumne *News* gives some interesting facts concerning the crops in that county, from which it appears that an immense amount of grain will be harvested this year on the west side of the San Joaquin river. In a region where not over 10,000 bushels of grain were ever raised before, there will be harvested this fall from 900,000 to 1,000,000 bushels. The *News* remarks that, enormons as this yield will be, there can scarcely be a doubt but that the lowest statement will certainly be realized. As nearly all of this is from land for the first time put into wheat, it will undoubtedly more than compensate for any falling off of crops in other parts of the State from the effects of rust, etc.

"HOW IS YOUR LIVER?"—This is the exclamation put by Lord Byron into the mouth of Beppo's wife on meeting her billious-looking lord after his return from captivity in a tropical clime. If the samo question was propounded to every American to-day, three out of every five thus interrogated would probably admit that the important organ was "out of order." Why should this be, when it is notorious that a course of DRAKE'S PLANTATION BITTERS will impart perfect regularity to its action, and give it a healthy tone, as certainly as the moon regulates the ebb and flow of the sea? Whenever the whites of the eyes betray a tinge of yellow, or there is pain in the right side or between the shoulders, or a general feeling of lassitude, languor and depression is experienced, be *sure* that the liver is affected, and commence taking this uncqualled anti-bilious and tonic preparation. The billious invalid who follows this advice will soon be able to meet the question, "How is your liver?" with the cheerful rospouso, "perfectly sound." *,*

THREE HUNDRED large mahogany logs from Central America, at much lower rates than Eastern mahogany, at Hobbs, Gilmore & Co's Box Factory, Market street, near Bealo. *,*

IF the type of your evening paper begins to look small, dim or indistinct, apply at once to C. Muller, 205 Montgomery street, for a pair of his A No. 1 Spectacles. *

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES;

United States Branch Mint, San Francisco, Cal., March 12, 1869.—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. Branch Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. A. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 25 pourings of brass.
GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs. A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when first used. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,

And in accordance with law, and an order of the Board of Trustees, made on the fourth day of June, 1869, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, Room 10 at No 402 Montgomery street, San Francisco, on Friday, the thirtieth day of July, 1869, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. W. COLBURN, Secretary.
Office, room No. 10 second floor of No. 402 Montgomery street, San Francisco. jy10

Thunderbolt Mill and Mining Company, White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the first day of July, 1869, an assessment of five cents per share (or $1 per foot), was levied upon the capital stock of said Company, payable on the tenth day of July, 1869, in United States gold coin, to the Secretary, at the office of the Company, No. 10 Stevenson Building, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twelfth day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twenty-sixth day of August, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

THOS. J. OWENS, Secretary.
Office, Stevenson Building, San Francisco, Cal. jy10

Yosemite Mining Company, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of July, 1869, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, San Francisco.

Any stock upon which said assessment shall remain unpaid on the seventh day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-fourth day of August, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary *pro tem.*
Office, No. 220 Clay street, San Francisco. jy10

Mining Notices—Continued.

Daniel Webster Silver Mining Company.—Location of Works: White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of June, 1869, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office.

Any stock upon which said assessment shall remain unpaid on the thirtieth (30th) day of July, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the nineteenth day of August, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.
Office, 413 California street, San Francisco, Cal. jy3

Metals—What are They?

[Written for the Mining and Scientific Press.]

BY E. PIQUE.

EDITORS PRESS :—In your issue of March 27th, you extract the following remarks from the *Mechanics' Magazine:*

"We have no general definition of a metal, to show us what constitutes any substance, metallic or non-metallic. This is very odd, as metals are considered to form such a distinct class from other substances. Still the most learned in chemistry are not agreed as to what substances are metals, etc. There apparently is no property yet discovered that is common to the whole list of fifty-two metals. The word metal, apparently, is just a name without any distinctive properties attached to it."

There seems to be truth in the above remarks. Some of the older chemical works give the following distinguishing properties:

Metals are elementary bodies, that

1. Possess a certain luster *(metallic luster)*. There are a good many other bodies that show the same; but they are mostly compounds, and not elements. The metals do not show that luster if precipitated in a finely divided state from a very diluted solution, but they receive it again by friction with a hard body.

2. They are not transparent *(opaque)*, and are *not soluble* in water. Both of these properties are shared by some not metallic substances; therefore, they do not afford any distioguishing mark.

3. Metals in a solid state are good *conductors* of *electricity* and of *heat*, while the non-metallic elements are *insulators* of oleotricity and bad conductors of heat. Only this last property has been retained by the new works of chemistry as a distinction.

It is generally agreed that out of the whole series of elementary substances there are thirteen that are not metals (oxygen, sulphur, selenium, chlorine, bromine, iodine, thorine, hydrogen, nitrogen, phosphorus, silicon, borax, and carbon). All of these (with the exception of *carbon*, which, when properly prepared, is a good conductor of electricity) are, in fact, insulators—or non-conductors of electricity—and this is sufficient to distinguish them from the metals. This holds good only at ordinary temperature, since the gases at a high temperature will conduct olectricity, and so will many of the solid insulating substances, when in a molten state. I would therefore propose the following definition: *Metals are elementary substances, which, at ordinary temperature are good conductors of electricity*, providing their particles are snfficiently condensed.

OUR INDUSTRIAL POSSIBILITIES.—"We shall yet make our own crockery and finer kinds of pottery, which we still mainly import, and shall grow as well as manufacture the silks for which we are still mainly indebted to the insects of China and the looms of France, we having in California a more genial climate for the silk-worm than Europe or Asia can boast; while we are already reeling and spinning, on American machinery invented for the purpose, vast quantities of raw silk imported in an imperfect or damaged condition (answering to the 'swingle-tow' of flax) which all the ingenuity and patient industry of 'the Flowery Land' had given up as hopelessly intractable and worthless. So shall we continue, under a beneficent policy of encouragement and support, to develop new and larger possibilities of industrial achievements, and in expanding and diversifying our own national industry, benignantly stimulate and ultimately renovate that of all mankind."—*Horace Greeley.*

THE CINCINNATI GAS EXPLOSION.—The engineer of the gas company writes in full of this occurrence,—before spoken of in the PRESS,—giving the facts and his explanation. The painter at work upon the crown of the gas-holder, who did not leave with the others at the dinner-hour, lighted his pipe and threw down the match. The gas that leaked from the crown, mixed with the air directly above it, and made an explosive mixture, which was ignited by the match. The pipe was found directly after the occurrence, still containing fire and hot ashes.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,

SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Acquires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

superior for working either GOLD OR SILVER ORES, and s the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. G. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequalled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing· Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.

San Francisco, May 1, 1868. 18v16tf

CALIFORNIA BRASS FOUNDRY.

No. 125 First street, opposite Minna,

SAN FRANCISCO.

ALL KINDS of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Oougs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch.

☞ PRICES MODERATE. ☜

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

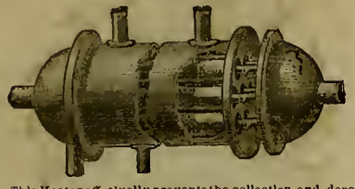
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, as I to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, **220** Fremont street,

1v1 San Francisco.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

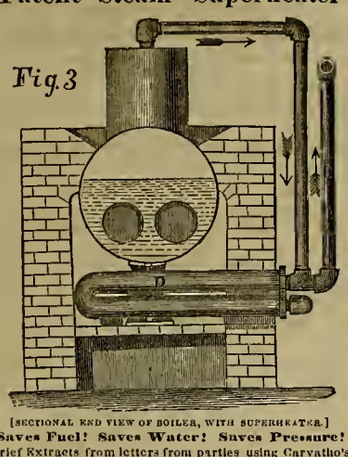
REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,
16v18-3m Patentee, Sacramento, Cal.

Important to every one using Steam for any purpose.

CARVALHO'S
Patent Steam Superheater



[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1868.

"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 3, 1867 (after *seven* years of service.)

"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.

"Superheater saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.

"Superheater saves 20 per cent. of coal, less steam pressure, exhaust more serviceable in drying paper."

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.

"Superheater saves not less than 20 per cent. fuel; no priming!"

CROCKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.

"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y. DYEING & PRINTING ESTAB., Oct 4, 1867.

"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINUOUS OIL REFINING CO., Binghampton, N. Y., Sept. 20, 1867.

"Superheaters give entire satisfaction, and we superheat to 55 deg—an increase of 20 deg."

CAREW MANUF. CO., So. Hadley Falls, Mass., Oct. 17, '67.

"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867.

"Superheater saves at least 25 per cent in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867.

"Superheater saves 25 to 30 per cent. in fuel; no priming"

CONTRA COSTA LAUNDRY, Oakland, July, 1868.

"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAVILAH M. CO., Cal., August, 1868.

"Superheater causes a use of 40 lbs. steam instead of 60 lbs; use much less water, and there is a saving of fuel." (2 sets.)

SIXTH MECHANICS' INST. FAIR, S. F. Sept 4, 1868.

"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.

"Superheater is a perfect success, and saves three cords of wood in ten, or 33⅓ per cent. in fuel; engine works better."

And many other letters of the same tenor.

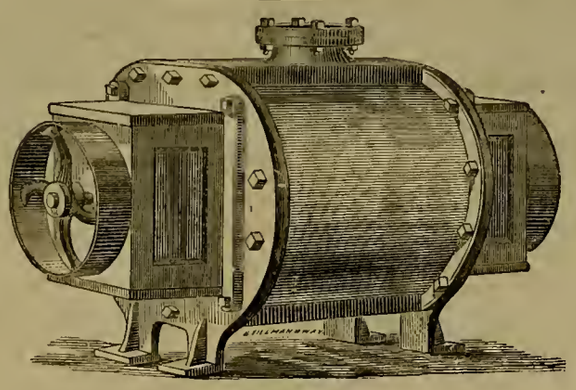
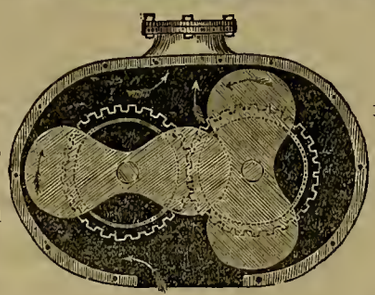
Awarded the First Premium at the Paris Exposition.



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may he seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

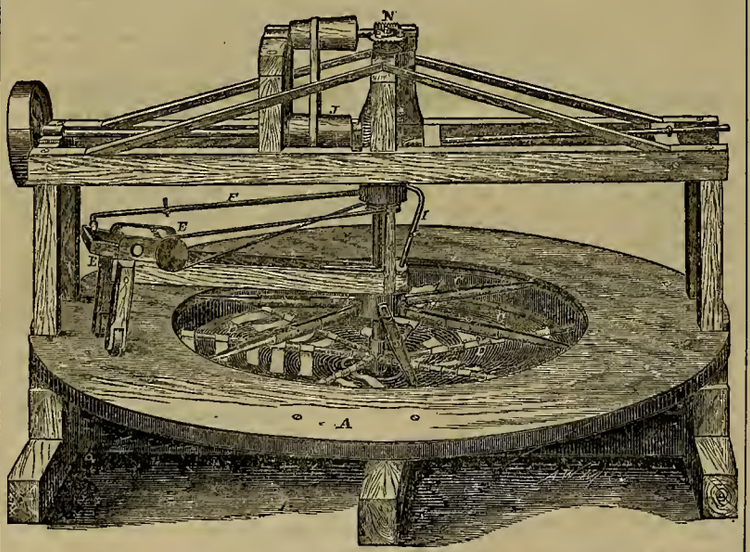
Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

KEEP & BARGION,
4v16 3m **Globe Iron Works, Stockton, Cal.**

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFCATES:

GRASS VALLEY, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.

WM. L. TISDALE, Supt. Star Spangled Banner Mine.

NEVADA CITY, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

REBELLIOUS ORES.
THE HAGAN FURNACE.

The above method for the purification of Rebellious Ores is respectfully offered to the public. Repeated actual workings show that the

HAGAN FURNACE

Will accomplish all that the Reverberatory Process will do, and at an expense that is merely nominal. It has never failed to treat any ore effectually.

It has never been claimed for it that it will extract gold from ores which do not contain any of that metal.

Parties owning rich but refractory veins, can treat with the undersigned upon the basis of

GUARANTEED RESULTS,

With responsible security. For an interview, and all desired particulars, address

THE PACIFIC ORE CO.,
P. O. Box **1019**, San Francisco.
June 25 1869. 29v18-3m

RANSOME'S PATENT
Diamond Grit Grindstones,

Warranted of Uniform Texture,

TWICE AS STRONG AND WILL CUT AT LEAST TEN TIMES AS FAST AS THE BEST NATURAL STONES.

We manufacture the following qualities, viz:

"Hard," for Machinists, etc.
"Medium," for General Use.
"Soft," for Wood Workers, Etc.,

Diameters, **4** to **70** inches; thickness, ¼ inch to 12 inches; and any fineness required.

Solid Emery Wheels and Sharpening Stones,
Of all forms and materials.

These Stones are fast superseding the natural ones in England, the tests made there showing them to cut about fifty (50) times as fast as the Newcastle, and entirely free flaws, and hard and soft spots.

☞ Grindstones, with Frames, Iron Troughs, Shafts and Treadles, ready to set up in working order, for sale a wholesale or retail.

PACIFIC STONE COMPANY,
E. T. STEEN, Sup't.,

International Hotel,
JACKSON STREET
BETWEEN MONTGOMERY AND KEARNY STS.,
SAN FRANCISCO, CAL.

THIS OLD ESTABLISHED HOUSE IS IN PERFECT order for the accommodation of guests. Persons seeking comfort and economy will find this the best Hotel in the city to stop at. The Beds are new and in good order, and the Rooms well ventilated. The Table will always be supplied with the best in the market.

Prices varying from $1 50 to $2 per day for Board and Room.

FINE BATH HOUSE AND BARBER SHOP ATTACHED TO THE HOUSE.

☞ Teams belonging to the House will be in attendance at all the boats and cars to convey passengers to the House FREE OF CHARGE, and to any part of the city for 50 cents

21v12 [F. E. WEYGANT, Proprietor.

The "Cloud Bursts" of Nevada.

Residents in the Great Basin frequently speak of "clond bursts"—very remarkable sudden rain storms accompanied by thunder and lightning which take place in the summer time, and which seem, therefore, to have their origin in the Gulf of Mexico.

The rainy season of Sinaloa, Durango, Sonora, and partly of Arizona, takes place precisely at the hight of our dry season, and the storms come invariably from the Gulf. Standing on the peninsula of Lower California, and looking across the Gulf of California, there is frequently to be seen in midsnmmer a great wall of black rain and thunder cloud which has been heaped and rolled up by counter cnrrents of the atmosphere, hanging for days, or weeks, without being able to make any farther advance westward. This mass coming from the Gulf of Mexico, draws northward [item for the "Avitor"] into Arizona and Nevada; furnishing the moisture for some heavy interior forests, such as those on the Uintah Mountains, in sight from the railroad beyond Salt Lake.

So sudden are the "clond bnrsts" of Nevada, that the name can scarcely be said to be a misnomer. A cañon found so perfectly dry, by the traveler, that he would not suspect it of having been rejoiced with water for many a year, may, in the space of a few minutes, pour down upon him such a boiling flood as will make the locality if narrow and confined, absolutely dangerous to vehicles or horsemen. Woodmen with teams, we are told, are not unfrequently obliged to make a "run for it" in order to escape intact with their tools and belongings.

The pecnliar featnre of these "cloud bursts" is that they are local. Some cause, or causes combined embraced under electricity and temperatnre, effect the very sudden condensation of cloud vapors over one locality. On the 25th inst., a sudden storm of this kind took place at Austin, of which the *Reveille* says:

A cloud was seen to gathcr and bnrst on Central Hill, above and a little south of the Boston mill. It discharged a volume of water equal, we should say, to 400 inches, which came rushing down the cañon, and throngh the upper portion of the city. It maintained its full volume for a quarter of an hour, after which it subsided gradually.

Neptunian Craters.

In the limestone country of the Western States—in Michigan, for example, near Green Lake, Kent Connty—there exist perfectly formed craters in level alluvial soil, the resemblance of which to the inside of an old and weathered volcanic crater, is very remarkable. The depth and diameter vary, but are in the case referred to about 75x100 feet. Calling to mind the vacancy in an unfilled bullet-mold, they were accounted for by the hypothesis that when the earth was molded, there was found not quite enough material ou hand to fill np. The following, from an exchange, especially if remembered in connection with our remarks on caves in the Nevada limestone rocks, will furnish a clue—Neptune being caught in the act:

A portion of earth near the residence of Johnson, in Plainfield township, Michigan, sunk recently to a depth of eighty feet, carrying with it a number of trees and stnmps. The open space is funnel shaped, about seventy feet across the top. Some of the trees lodged half way down the side, while others went to the bottom, leaving the leaves and branches withiu reach of the mouth of the opening. Two or three stumps and a log about fonrteen feet in length thrown in, afterwards passed out of sight. A distant roaring sonnd as of rushing waters, is said to proceed from the chasm.

SILK is manufactured extensively in Patterson, N. J., New York City, Hartford, nnd other Eastern cities, out of material from France, Italy, Japan and China. So soon as California has cocoons to spare, the proprietors of those mills will no doubt come aftor them.

Information for Inventors and Patentees.

AN EXTRACT

From the American and Foreign Patent Agency Circular of the Mining and Scientific Press, Dewey & Co., Publishers.

Steps Necessary to Procure a Patent.

The FIRST thing reqnired is a model, if yonr invention can be represented by one. It is not only immediately necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in nny of its dimensions. A model of less size will answer when more convenient. It should he neatly made, of hard wood or metal, or both, and varnished or painted; the name of the inventor and the name of the article should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, n full working model of the whole will not be necessary. It should he sufficiently perfect, however, to show, with clearness, the nature and operation of the invention, and the relation of tho new to the old parts of the machine.

As soon as the model is ready, it should be carefully boxed nnd shipped by express, or otherwiso, to our address, namely: DEWEY & CO., *Mining and Scientific Press, San Francisco.* Prepay expenses and send express receipt to us by mail.

A full description must also be sent with the model, embodying all the idcas and claims of the inventor respecting the improvement, describing the various parts and their operation.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by registered letter, post office order, or by draft on San Francisco, payable to our order. Always send a letter with the model, and with the remittance, stating the name and address of the sender. On receipt of the model and Government first fee of $15 in currency, tho case is duly registered on our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and acknowledgement before a Notary Public or Justice of the Peace, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government last fee of $20 in currency will be required. The law states that every patent shall be dated as of a day not later thnn six months nfter the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if tho final fee for such patent be not paid within the said six months, the patent shall be withheld, and at the expiration of two years the invention therein described shall become public property as against the applicant therefor.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, (unless they are of n common and well known character), and also of the manufactured article itself must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case the applicant has only to send us an exact description, and what it is desirable to claim.

For Designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances two photographs, with the negatives, answer well instead of drawings.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless the invention is one of great complication, usually the business can be well done by correspondence.

The usual time required to secure a patent, when the case is conducted at our agency, is from one to two months. We sometimes get them through in two weeks. In rare cases, however, owing to delay on the part of Government officials, the period is sometimes extended for months. We make a special point to advance our cases as rapidly as possible, and have been successful in obtaining patents for this coast more surely and speedily than any other agency in the United States.

Letters Patent and Who Can Obtain them.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or Foreigners, male or females, (including minors), and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

Citizens of Canada and Nova Scotia have to pay a fee of $500 for patents in the U. S., owing to discriminations made against Americans.

☞Our Illustrated Pamphlet, from which the above is an extract, will be furnished free on receipt of postage stamp. Confidential advice given, and every legitimate branch of Patent Soliciting business promptly and faithfully executed, by

QUARTZ OPERATOR'S HAND-BOOK.

—BY—

WHEELER & RANDALL.
San Francisco, 1865.

A cheap and handy book for Quartz Prospectors, Millmen, and Amateur Assayers.

This little work, of 130 pages, although partly devoted to a discussion of limited interest to general readers, contains instructions in the WORKING AND ASSAYING OF ORES, AND TABLES FOR REFERENCE, which renders it quite desirable and of frequent service.

Price, $1, coin—$1 30 in currency or postage stamps. For sale by DEWEY & CO.,
Mining and Scientific Press, San Francisco.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1863, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Representative Men.

Some fifty or seventy-five gentlemen, capitalists, representing the chief cities of the Mississippi Valley and Atlantic Coast, have arrived in this city during the past week. "They come," so says report, "to prospect the State commercially; to see what they can buy or sell, or to search out a place in which to established a branch or an original business." Some of them will no doubt conclude that California is the best location that presents for certain classes of business, both foreign and domestic; and we presume a large proportion of these visitors will arrange for business relations on this coast, of greater or less magnitude, before they return.

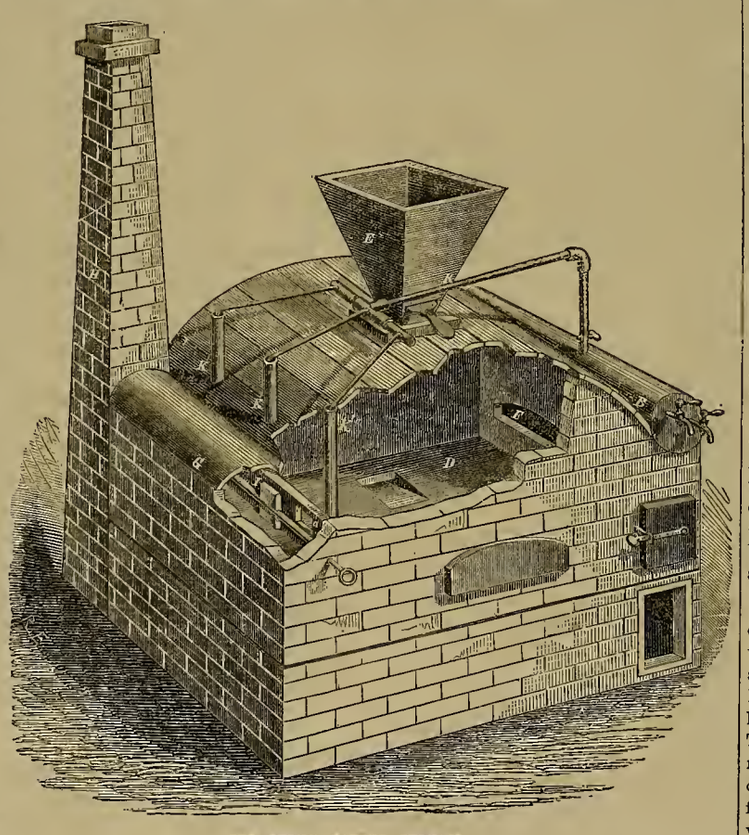
This movement is one which cannot fail to be productive of much good, in establishing commercial harmony and reciprocity between the emporium of the Pacific, and our Eastern cities. The East want teas, silks, etc., and come to San Francisco to see if some better mode of obtaining them cannot be devised, than the hitherto tedious passage around Cape Horn, or across the Isthmus. Much will also be done by this notable visit, towards still farther facilitating commercial relations between our Western and Eastern cities, and the new locations which are springing up all through the great interior of the continent, and now made tributary to the East and West by the completion of our great national highway.

THE INCREASE OF TEMPERATURE UNDER GROUND.—A committee, composed of Dr. Everett, Sir C. Lyell, Principal Forbes, Mr. J. C. Maxwell, Prof. Phillips, Mr. G. J. Symons, Mr. Balfour Stewart, Prof. Ramsay, Mr. Geikie, Mr. Glashier, Rev. Dr. Graham, Mr. E. W. Binnie, Mr. Geo. Mann and Mr. Pengelly, was appointed by the British Association at the Dundee meeting (1867), for the purpose of investigating the rate of increase of underground temperature downwards in various localities of dry land and under water, for which a sum amounting to £250 was placed at their disposal. The names are a guarantee that the investigation will be a searching one. The report may probably appear in the next volume of the transactions of the Association, which may be anticipated in the course of the current fall.

The Burns' Furnace at Meadow Lake.

The accompanying cut is after a drawing of Mr. Robert M. Burns' furnace, the principle of which has been tried at Meadow Lake, Nevada County, on a small scale.

"Certainly, some day,"—say the Truckee *Tribune*,—"some one will discover a process for the reduction of these ores, and when it is discovered and put in operation, Meadow Lake district will not be surpassed in the State; as it is, it must rest beneath its robe of snow, a deserted district." The auriferous iron pyrites of Meadow Lake contain $60 to $70 to the ton, but are more than usually "refractory," owing to the presence of other unfavorable mineral ingredients.



THE BURNS' PATENT FURNACE.

Mr. Burns claims to have solved the problem of profitable working. His method of procedure will be understood from the engraving, with the aid of a few words of explanation.

The ore is not pulverized, but is fed at once, in small pieces, through the hopper, E, into the chamber, D, where it is exposed to the influence of flame from the fireplace, F, and of steam from the pipes, K, K, K, obtained by heating water in the boiler, B, over the fireplace, whereby it is claimed that waste from volatilization or mechanical loss from draft is entirely prevented. A covered way, G, conducts the fumes to the chimney, H; a damper slide, I, being connected with a rod by which to regulate the draft. The time of roasting is about twenty-four hours.

At the end of that time the ore is drawn through the opening seen in the bottom of the furnace. It falls into a tank containing a solution, the exact operation of which is not fully understood. On drawing off the water into another tank the ore resembles ashes in consistency, and is said to be in a condition to be amalgamated with very favorable results.

Tests similar to those at Meadow Lake were recently made at Indian Valley, Plumas County, and parties witnessing the same have been so favorably impressed, we are told, that arrangements have been made for the construction of a furnace.

Mrs. Elizabeth Burns is the inventor of the process, as has already been published by the press throughout the State. After the patent is obtained, we may be at liberty to publish a more complete description—the solution used being a considerable portion of the invention.

Those desirous of obtaining further information on the subject, are referred to Robert M. Burns, Meadow Lake, Nevada County, or John H. Blood, Indian Valley, Plumas County. A patent for the above has been applied for through Dewey & Co.

Award of Bounties for Mulberries, Cocoons, etc.

The State Board of Judges met at Agricultural Hall, Sacramento, on Thursday, to make awards to the parties claiming bounties for plantations of mulberry trees, for cocoons, hops, and manufactures. Specimens of mulberry trees and cocoons, and worms in every stage of progress, were exhibited. The cocoons were very fine, and pronounced by competent judges the handsomest ever exhibited in the United States. By general consent it was conceded that the exhibit of Smith Brothers was the best.

Following are the names of exhibitors, the amounts claimed, and what for:

Mulberry Plantations of five thousand trees, over two years old, under the Act of 1866: I. N. Hoag, $6,125; C. W. Reed, Yolo, $8,875; John Smith, $500; Wm. M. Haynie, $300; E. F. Aiken, $375; J. T. Harbison, T. B. Flint; Leon Lambert, San Jose; M. Souffignon, San Jose; D. A. Merritt, T. G. H. Jones, and G. C. Holman, $250 each; A. P. Smith & Bro., $100; and G. L. Henry, $125;—making an aggregate of $18,150.

For Cocoons—Thos. A. Geary, $360.

For Hops—David Flint, $1,000.

The Agent of the Oakland Cotton Mills submitted for examination a bolt of cotton drilling, claiming therefor the bonus of $2,000.

The Mission Woolen Mills exhibit samples of tweeds, cassimeres, broad and pilot cloths, claiming therefor bounties amounting to $15,000.

After some considerable discussion, the claims of Messrs. Hoag, Reed, Harbison, Aiken, Haynie, John Smith and A.P. Smith, were severally allowed; as also were the claims of Mr. Geary for cocoons; of the Oakland C. M. Co., and for the Mission Woolen Mills for manufactures were also allowed—aggregating a total of $33,785.

ANOTHER ATLANTIC CABLE.—The French cable which is to connect the United States with the French port of Brest *via* St. Pierre, a French island just to the southward of New Foundland, has been successfully landed by the Great Eastern at St. Pierre. The length of cable paid out was 2,325 miles, or 861 miles longer than the English cable. The remaining portion of the cable from St. Pierre to its landing near Boston, will be 722 miles in length, and will soon be paid out by a ship, on board of which it has already been placed. The completion of this cable will no doubt have the effect to materially reduce the cost of European telegraphing.

SHODDY FOR UPHOLSTERY.—Mr. Phillip Hirlemen and Mr. Julius Inholsky, have started a shoddy and batting mill on Berry street, occupying a part of the ground floor in Emanuel's Planing Mill and Factory. The machinery was furnished by Berry & Co., of this city, and is of the most improved make. They design increasing the capabity of the mill in a short time. They manufacture wool and cotton shoddy for upholstery and other purposes, of various grades, and cotton batting and wadding.

Communications.

Account of Reveille and Adjoining Districts.

[Written for the Mining and Scientific Press.]

Since my return from Reveille, I have paid a little attention to the mines on the lower sides of Treasure Hill, with a view to the collection of some statistics and facts that would seem to have some hearing upon the question as to whether rich ores will be found at considerable depth—say from 500 to 1,000 feet from the top of the hill. I first visited the Virginia, situated on the north end of the hill a little below the Mammoth and "Omega," perhaps about half way in point of elevation from Hamilton to the summit of Treasure Hill. The works are on the left hand of the grade and can be easily seen on the way from Hamilton to Treasure City. I found at the mine, Mr. Geo. A. Willard, the recently appointed Superintendent, who, although a young man, seems to have the courtesy, the experience and the rustling business energy and promptitude necessary to make him a successful manager of a mine.

I confess myself much disappointed at the appearance of this mine. It is working twelve men at present. It has a tunnel 200 feet long, being nearly completed to the bottom of the shaft, which is 30 feet deep. Short drifts have been made each way. The shaft shows a body of ore apparently pitching southwest on a southeast and northwest course. A hundred feet southerly from the shaft, the lime cap is stripped off, showing two other bodies of ore about six or eight feet wide, pitching and bearing the same as the first or principal ledge. From the appearance of the 100-foot surface it would seem to be one grand body of ore, with strata of limestone interspersed. It seems to have more system and regularity than most deposits, and yet lacks the definite walls of a true fissure vein which may be found at a greater depth. There is a body of ore in sight. From the surface opening, including the shaft, thirty feet deep, and the two short drifts of ten feet, there has been piled upon the dump about 300 tons of milling ore, estimated from numerous assays at $250 per ton. Mr. Janin's dump sample was, as we learn, $255 per ton. Almost an unlimited amount of ore can be taken out as soon as mills can be obtained to crush it.

The Newark Mill, under the direction of Col. Avery, is about to commence on this rock at $50 per ton, roasting process, which process is necessary in reduction. I "cahhaged" under the eye of the Superintendent, two pieces from the dump, one weighing about eight pounds, and the other about two pounds, which assay a fraction over $2,000 to the ton.

Mr. Willard has a "theory" about the "belt" which looks quite plausible. He called my attention to the light appearance of the surface rock,—a belt two or three hundred feet wide running southeasterly and northwesterly in a direct line from the Phœnix and Featherstone, crossing the Hamilton grade, taking in the Virginia, Aladdin's Lamp, Mammoth, Shehoygan and Omega, and extending to and including the Pocotillo. Another party from Bullion Hill informs me that that Hill is a continuation of the same line and the same general belt. As to these theories I express no opinion; but others, acting upon the suggestion, can observe for themselves as they pass over the ground. The Virginia proper is 600 feet, and the Aladdin's Lamp adjoining, and now included in the incorporation, is 1,000 feet, for all of which there are 16,000 shares of stock, now under an assessment of $1.25 per share.

The Featherstone is situated on the lower hill, just back and west of Hamilton, and about half a mile from the Virginia. We found no one at the mine; but considerable work has been done, and considerable ore, apparently medium grade, is on the dump. The ledge is "faced up" some distance lengthwise, and stripped to a much greater distance. While it does not rank with the first-class mines, it shows sufficient positive mineral wealth, both in quantity and quality, to justify more extensive operations.

The Mammoth is situated just above the Virginia, and in close proximity. The works and extensive croppings are the most prominent feature on the Backbone of the hill, about three hundred yards north of and below Treasure Peak. The croppings are similar in general appearance to the croppings of the Virginia.

The Omega is the first south extension of the Mammoth, and the Shehoygan is a little above and to the west of the latter. The Mammoth Co. allege that the Shehoygan men are jumpers. However this may be, the latter have faced into the ledge about thirty feet lengthwise, which work exhibits its course and pitch much better than all the work done on the Mammoth claim. They have taken out considerable good ore, and apparently have a well-marked, broad ledge, dipping into the hill directly under the bottom of the Omega shaft. The Mammoth (if my memory serves me rightly) has the first location on the hill after the Hidden Treasure. The present holders or Trustees seem to think they have as good a thing as they want, and content themselves with "tracing out jumpers" rather than in developing the mine." They have made innumerable cuts, ditches and holes, one small attempt at a tunnel, and have done considerable work in "facing in" at the north end of the large croppings. There are five or six shafts, from fifteen to twenty-five feet deep, and drifts are being run from one shaft to another, and at all points they find large bodies of medium and low-grade ore, worth from $40 to $100 per ton. Of course selected pieces assay much higher. I saw an assay from the corner of a two-pound piece which gave $40 per ton; and the *whole* piece pounded up, and two different assays made from pulp, gave, one $274 per ton and the other $276. I have been informed that assays have been made as high as $1,600 per ton. Though they have found some chloride rock, yet neither it nor the exceptional high assays furnish a criterion by which to classify the valuation in its present state of development. These little smatterings of chlorides and exceptional assays may be received as indications of what may be found in the mine when it is fairly opened down to the level of the Virginia, or even a hundred feet. As it stands in its present state of development, it must be classed as a large mine, with almost unlimited quantities of from $50 to $100 rock, but liable at any time, in sinking, to strike rock as rich as the Virginia and Hidden Treasure, lying on either side of it. All the works both of the Sheboygan and Mammoth show the ledge, ledges or bodies to be on a line with the Virginia, and apparently to have the same course and dip into the mountain.

With one-tenth the expenditure, the Omega has done more than both the other mines together. It is simply good mining for this country. It is the difference between the concentrated action and energy of a single experienced brain and the divided counsels of larger companies. The Omega, calculating the dip on the ledge, started above on the side of the hill, and without "fuss or feathers," have sunk a shaft 85 feet, well timbered, in true miner's style. It is now in spar and some mineral, and if the ledge continues to dip, as at the Sheboygan, the shaft will be fairly into it at a depth of 100 or 120 feet.

So much for the mines on the north slope of the mountain which apparently pitch into the heart of Treasure Hill. In all cases where I have spoken of ledges, lodes, deposits or bodies of ore, I have used the terms as synonyms. I have no opinion on the subject of true "fissure veins." There seems to be some lode, some *mantas de plata*, some deposits, some little streaks and pockets; and sometimes the object of the miner's search is diffused in limestone and almost every other kind of rock which the country produces. God has made nothing in disorder—though it would appear otherwise here. In our next we will speak of claims on the other side of the mountain.

Las Minas.

Death of a Chemist.—Prof. H. Dussance, a chemist of some eminence, who has been a regular contributor to the columns of the *American Artisan* for several years, died suddenly at his residence in New Lebanon, N. Y., on Sunday night, June 20th. He was by birth a Frenchman, and had formerly been employed in the laboratories of the French Government, and had been Professor of Industrial Chemistry to the Polytechnic Institute, Paris. He had been many years in this country, and was the author of several works on industrial chemistry.

Universal Law.—Is Heat a Form of Matter?

[Written for the Mining and Scientific Press.]

All the physical and metaphysical theories of the ancient Egyptians were founded upon the principle that solar heat is the cause of life and motion, throughout creation. They point us to the influence of the sun, which is constantly exercising an omnipotent energy through air, ocean, and earth; producing climate, regulating seasons, and causing evaporation and rain. He fans the air with the atmosphere, and his alternate smiles and frowns give sunshine and storm.

Among the most enlightened nations of antiquity, elementary fire was regarded, not only as the most refined and spiritual essence of all the elements, but as a universal and self-acting principle, which they considered identical with existence or being. Learned etymologists have shown that the word "am" denoted both heat and existence, among the early Egyptians; who, believing it to be the cause of motion and organization throughout nature, inscribed it upon the great door of one of their temples.

As everything in nature is arranged by measure, number and weight, we are led to inquire, What is matter? In the first place, we are informed that matter is composed of exceedingly small, hard and unchangeable atoms, which vary in magnitude, and which are so arranged and combined as to produce an endless diversity of mineral, vegetable, and animal bodies. We are led to inquire further: Are those atoms divisible? If they are infinitely divisible, a finite body must consist of an infinite number of parts, which is a contradiction. It follows, then, that matter must consist of ultimate atoms, and that being compressible, the atoms not being in contact one with the other, it must be surrounded by some elastic medium. The celebrated Doctor Black, when he discovered latent or combined heat, and proved by accurate experiments that definite measures of heat or caloric are required to convert solids into liquids, and that the same subtle fluid is obtained from the atmosphere, by respiration, he uncovered a great truth.

But electricity has been put forth as accomplishing the same thing, and is called the key to unlock the cabinet of nature. Franklin and Faraday called it a material fluid, and have said definite measures thereof belong to each element of ponderable matter. Prof. Davy, Arago, and others, found that electricity is capable of producing all the phenomena of magnetic action, on a small scale. They succeeded in producing an electric spark, from a permanent magnet, and arrived at the conclusion that electricity and magnetism are identical. It has been demonstrated, experimentally, by numerous philosophers, that all varieties of electricity are essentially the same. What can be more different than ice water and steam; yet they are composed of the same elements, combined with different proportions of caloric. What can be more unlike than the opposite forces of attraction and repulsion, contraction and expansion; yet it has been proved that they are both produced by caloric, under certain conditions. Caloric unites atoms of matter, as in chemical union, and under other conditions destroys this chemical union, as in vapor and combustion. If caloric is the physical cause of all motion, then what is electricity but the same thing, in a modified condition; only that electricity is developed under certain conditions; while caloric is manufactured under all conditions, while the sun exists.

What is this caloric or heat? Is it material or not—is it cause or effect? Upon the answer to this question a great mystery depends. Chemists and philosophers are divided. Rumford, Tyndall, and others, deny its materiality, and assert it to be an effect only of motion. If this is so, then what is the cause of motion? The answer would be, Force, which is a power capable of originating motion, supposing everything at rest, and may be traced to attraction and repulsion, or the primary and visible effects of these two forces as exhibited in the expansion and contraction of matter.

Now if it is true, that the elastic force of bodies is augmented by every addition and diminished by every abstraction of caloric, is it not proof that caloric is the cause, and not the effect, of attraction and repulsion? Then as to its materiality, it has been estimated by Issac Newton and others that the atoms of all bodies are surrounded by an elastic medium, which prevents contact, and that the pores of gold occupy about the same space as its solid atoms, and that water pores are forty times greater than its solid atoms, and that every change in temperature is attended with motion. Among the particles of bodies, it shows that caloric is a self-active principle, and if it is true that all bodies are full of caloric, that it occupies 827 parts, by volume, of the atmosphere, and 1,719 parts of steam, it must constitute the greater part of the globe we inhabit; in bulk, it must be material, as all good thermometers will show. With mathematical certainty it is self-evident that it augments the volumes of solids, liquids and gases, which are again reduced by abstracting what was added; that it passes by radiation through the most perfect vacuum, and shows the same effects as in the atmosphere; that it exerts mechanical and chemical forces which nothing can restrain, as in volcanos, explosion of gunpowder, nitroglycerine, etc.; it operates sensibly on the nervous system, giving pain and disorder when in excess; that it modifies the forms, properties and conditions, of all other bodies in an endless variety of ways, is presumptive evidence of its materiality.

W.

Abolition of Patent Rights in England.

The subject has been seriously discussed in the English House of Commons of abolishing the entire patent system. The accomplishment of such a backward step would be deeply deplored by every intelligent citizen who delights in the progress of invention, art and science.

Some of the numerous reasons why inventors should be encouraged and protected, are well set forth in the protest against repealing the laws, by the "Inventors' Institute," as follows:

1. It is the duty of the state to encourage invention by every legitimate means, in order to enable this country to maintain its supremacy in mechanical and chemical arts.

2. That the inventor is entitled to reasonable remuneration for his labor, expenditure, and skill, equally as much as the author or the artist is entitled to copyright for his book or work of art.

3. That the patent system, though defective, is the best practical method of remunerating inventors yet devised, inasmuch as under it those persons only who use inventions, and to whom, therefore, they may be assumed to be of service, pay for their use.

4. Experience shows that no system of rewards from the state could ever be made to work satisfactorily, either in the interests of inventors or the public.

5. The inventor, as distinct from the manufacturer, has a right to be heard before the patent laws are abolished or materially altered.

6. Inventors—and especially those belonging to the working classes, to which classes the great majority of inventors belong—are entirely opposed to the abolition of the patent laws, though they earnestly desire their amendment.

7. That by a good system of patent law the progress of the trade and industry of the country would be largely benefited, as the whole inventive talent of the nation will be thereby incited to strenuous and continued efforts to maintain our industrial position against the very active pressure of foreign competition now affecting our commercial prosperity.

8. The workingmen, who are largely represented by the present deputation, are especially anxious to find themselves in position, under an amended patent law, in which they can not only safely exhibit their inventions in public, but be enabled to reap the fruits of improved education and increased application of invention.

The English patent laws are nearly as cumbersome as the "great seal" (composed of three or four pounds of sealing wax), which is attached to all patents when issued; but this is no reason why the laws should be entirely abolished.

Mechanical Progress.

The Black Sea Cable.

The Indo-European Telegraph Company will soon lay down between the Crimea and a point on the Asiatic shore of the Black Sea, the cable just completed for it by the Messrs. Siemens. The *Mechanics' Magazine* thus describes the manner of preparing the copper sheating which protects the double serving of best Italian hemp that surrounds the core of copper and gutta percha:

"The sheathing is of strips of flat copper ¾ inch in diameter, laid helically. The copper selected is of the best quality, and arrives in the shape of long broad sheets. These sheets are first passed through the shearing machine, where, by means of knives placed above and below, the entire sheet, as it passes through, is divided throughout its breadth into equal narrow strips of the breadth required. On coming away from the shearing machine the strips are wound on small bobbins. If a strip of metal or anything be attempted to be wound around a long cylinder, it will infallibly bulge up and tend toward the trumpet form, and in order to prevent such a result happening to the copper strip in the cable, it undergoes a process termed "rabbeting." Each strip, before going to the sheathing machine, passes through this operation, which consists in slightly bending its edge and grooving its center. The bobbins are then taken to the closing machine for the final process. After two servings, in reverse directions, each of twenty compound strands of hemp, the cable receives its external protection of copper sheathing, which consists of four strips of the prepared copper, laid helically, one strip overlapping the other for one-half its breadth. In consequence of the strip being previously prepared, the cable comes out nice and smooth, and coils most readily, being exceedingly flexible and easily managed. The strips of copper are soldered into continuous lengths, care being taken that no two joints be allowed within a certain distance of each other."

Combined Air and Steam Engine.—We find in *Engineering* the following description of Warsop's engine, lately tested at Nottingham: "The engine being started by steam in the ordinary manner, a single-acting air pump, worked from the crank-shaft, compresses air to a little more than the boiler pressure, the air thus passing through a long circuit of straight and coiled pipe, which traverses the exhaust pipe, makes several spiral coils in the chimney, then descends at one side of the fire-box, exposed to the full fire, and finally connects with a valve-box, through which the air, more or less heated, enters the boiler at the bottom of the water space. So far as the experiments—carefully made upon an imperfect engine, worked alternately with steam alone and with steam and air—can be taken as establishing a principle, they indicate a considerable economy—an economy, however, beyond anything which, as yet, is inferable from theory."

Photographic Seals.—The *Journal of Applied Chemistry* describes an application of Woodward's photographic process,—of which we have already made mention,—by which a Freiberg photographer prepares seals and stamps bearing the likeness of his customers. A thin layer of gelatin sensitized with bi-chromate of potash is exposed to the action of light under a photographic positive by which the parts acted upon are rendered insoluble in water. The gelatin film is immersed in water, and the parts not acted upon by light swell up, and we obtain a picture in relief, of which a plaster cast can be taken. A galvano-plastic copy being taken of the cast we have a metallic fac-simile of the photograph, which can be employed as a seal. The journal above named says: "It suggests a method for obtaining perfect likenesses of persons in metallic *cliches* for the printer, and also an admirable way of illustrating scientific books."

Steel vs. Iron.—The railroad from Paris to Marseilles is to be entirely relaid with steel rails in place of the present iron ones. It will require one hundred and thirty-seven thousand tons of steel. It is expected that instead of four years, the present limit of wear in the vicinity of the stations, the new rails will last thirty. The bridges on the same road will also soon be rebuilt of steel.

Photographic Paper.—W. H. Davis gives the following in the British *Journal of Photography*: "My method for preparing the surface—is the following for direct printing: Take from four to six grains of gelatine, soak it in an ounce of water for an hour, then melt it gently over a fire, using a clean earthen pipkin. When fully dissolved, add to it, while yet warm, and stirring it gently during the mixing, from four to six drachms of a solution of lac in methylated spirit, made in the proportion of six ounces of spirit to one of lac, and digesting it till dissolved. The mixture of the gelatine and gum lac in spirits produces a creamy-looking emulsion, to which is added four grains of chloride of sodium, or its equivalent of chloride of ammonium or barium. When fully dissolved, filter through fine muslin into a clean pipkin, and it is ready for use.

"I apply warm with a flat camel's-hair brush. When the paper is dry it is ready for sensitizing, which may be done by flotation on the ordinary printing bath, or by brushing on the silver solution. I prefer to use the ammonio-nitrate solution brushed on. I use forty grains of silver to the ounce of water."

Smoke.—"The evil begins and ends,—says the Pittsburg *Commercial*,—with firing. Generally speaking, any man who has strength sufficient to wield a shovel, and wit enough to keep sober, will do for a fireman. We have seen one of these, called an excellent fireman, set aside by a man who understood the art, and who produced more steam with two-thirds of the fuel and about two-thirds of the labor. Having built his fire to the proper hight, instead of cramming fresh fuel in in such a manner as to keep it black, or in a fitful blaze, he managed, with comparatively little exercise, to keep it red. The result was, the decrease of smoke was as remarkable as the saving of fuel. We argue from this that one of the first steps toward the prevention of smoke in this city, and the saving of fuel, would be secured simply by placing a premium upon firemen who understand their business and make it a study."

Self-Registering Compass.—The "Albini Compass" keeps a record of the course steered by the vessel. The compass card carries on its under side, and near its periphery, a number of types, which correspond with those on the upper side of the card. A continuous strip of paper, moved by clockwork, passes under the card at that side which is next the bow of the vessel, and between this paper strip and the card itself is an inked tape, which travels slowly. At frequent regular intervals the compass card is tilted, so as to bring the type which happen to be immediately above the paper strip at the time down upon the inked tape, bringing the latter in contact with the paper, and marking upon the latter the letters denoting the course which the vessel is steering at that moment.

A Thirty-foot Paper Boat.—The Portland *Argus* says, Walter Brown has a paper boat, of the Waters' patent, from a model of his own. This boat is 31½ feet long, 12 inches wide, and weighs but 22 pounds. The lightest wooden boat ever made of similar dimensions weighed 41 pounds. The boat is more than four times stronger than one of wood. All of it, save where the sculler sits, is gas-tight, so that in the event of a race sufficient gas may be taken into it to reduce its weight to 8 lbs.

Combined Liquid and Solid Fuel.—An English inventor has patented an arrangement for burning petroleum or other liquid fuel in combination with solid fuel; the latter being reduced to dust, and blown into the furnace. Complete combustion of the solid fuel is by this means obtained. The liquid is admitted into a jet of air forced into the furnace by means of a fan.

Copal Varnish.—This should be made by dissolving one part, by weight, of camphor, in twelve parts of ether; Then four parts of the best copal resin, reduced to powder, are added to this in a well-stoppered bottle. As soon as the copal has become swollen, four parts of strong alcohol, and ¼ part of oil of turpentine are added. After shaking the mixture, and letting it stand for a few hours longer, a thoroughly good copal varnish is obtained.—*Bottger*.

Writing on Glass.—A solution of fluorine of ammonium is recommended as furnishing a ready means of writing with a pen of any kind upon glass, and is especially adapted for labeling bottles, cylinder-tubes, etc., in the laboratory, as well as for marking the degrees upon hydrometers and apparatus of similar construction.

Scientific Progress.

The August Eclipse.

The total eclipse of the sun, on the 7th of August next, is the only one which will be visible in America during the remainder of the present century. As a partial eclipse it will be visible all over the northern parts of the continent, while the path of the umbra in which the eclipse will be total is about 143 miles in breadth, entering the United States near the origin of Milk river, longitude 30° W., thence diagonally through Iowa and Illinois, crossing the Ohio near Louisville, Ky.; thence through North Carolina, entering the Atlantic just north of Beaufort, and ending at sunset in the ocean, in latitude 31 deg., 15 min., 2 sec. N.; and longitude 9 deg., 34 min., 6 sec. E. In Washington City the umbra commences at 5 h. 2 min. P. M., and ends at 9 h. 52 min. P. M. Prof. Hall, of the Naval Observatory, and Mr. Joseph A. Rodgers, of the Hydrographic Office, left Behring's Straits, under orders from the Navy Department, to take observations in that quarter, at which place the eclipse makes its advent. Professors Simon Newcomb, Wm. Harkness, and J. R. Eastman, of the Naval Observatory, have been ordered to Iowa, each to take observations, acting independent of one another. Professor Newcomb will take with him the largest object glass from the Naval Observatory he can procure, and search for asteroids between Mercury and the sun. Leverier thought that a zone of planets existed between Mercury and the sun. They have never yet been discovered, and no hopes are entertained of their discovery, (if they exist), except during a full eclipse. Prof. Harkness will make observations with the spectroscope. Dr. Curtis, of the army, will accompany the observers, taking with him the large equatorial from the United States Naval Academy, loaned to the Observatory by Vice Admiral Porter for photographic observations. Prof. Eastman will make meteorological observations.

Dr. C. H. F. Peters, Director of Hamilton College Observatory, has organized an expedition for taking observations. It will be provided with two telescopes, two chronometers, and a spectroscope. Des Moines, Iowa, has been selected as the point of observation. The party will consist of three,—Dr. Peters, Wm. A. Rogers, of the Sheffield Scientific School, and F. M. Nall, of New York.

Comet Composed of Carbon Vapor.

In the Proceedings of the Royal Society, Mr. Huggins gives an account of his observations upon Comet II of 1868. "When the light from its head was examined with a spectroscope having two prisms of 60°, three bright bands were observed. On comparing these bands with those of other spectra, it was found that they coincided exactly with those given under certain conditions. Thus in 1864, Mr. Huggins had observed that when the spark from an induction coil with leyden jars in circuit, was taken in a current of olefiant gas, the spectrum shown coincided with the carbon spectrum obtained under other conditions, except that no separate, strong lines were to be distinguished, and in place of the shading composed of fine lines, found in what might be called the normal carbon spectrum, that for instance of the spark in olive oil, an irresolvable nebulous light was given. On the 2d of June, 1868, the spectrum of the comet was compared directly with the spectrum of the spark in olefiant gas, and the identity of position and character between the bands was then very manifest.

We are thus led to the strange conclusion that this comet is composed of luminous carbon vapor. Now we know, that to vaporize carbon, as we have it within the range of experiment, requires heat of great intensity and peculiar conditions of chemical reaction, as in the case of a jet of olefiant gas supplied with air, which gives a greenish flame, resolvable into the carbon spectrum. How any such conditions of temperature as those developed by the induction spark which produces carbon vapor directly, or those of the mixed air and gas flame where it is indirectly developed, can subsist in a comet, we are at a loss to imagine. This mystery, however, does not stand alone, for in the case of the gaseous nebulæ we have a like example of self-luminous gas maintaining its luminosity with a similar absence of adequate cause. It would appear possible that some action related to phosphorescence or to fluorescence might be concerned in this result, but such a conjecture is unsupported by any evidence of similarity between the spectra of bodies exhibiting these appearances, and of these celestial objects. We can then simply regard this comet as a vast globe of glowing carbon vapor, having a density approaching that of our atmosphere, maintained in its luminous state by forces and conditions of which we have absolutely no knowledge."

Life a Molecular Property.—"B," in the Yale College *Courant*, after referring to Prof. Haeckel's discovery of the organism which he named *Protogenes*,—the simplest form of life, a mere drop of living jelly,—says:

"The *cell* has always been the refuge of vitalists; when science has attempted to show that the so-called vital force, formerly regarded as something mysterious and sacred, is nothing but a transmuted sun-power, and that its phenomena have a purely chemical and physical origin, the objection is instantly urged "neither chemical nor physical force has yet produced a cell;" the inference manifestly being that the cell is absolutely necessary to the phenomena of life. But now comes in Haeckel's discovery of an organism which is capable of taking solid nutriment like an animal, and yet which is absolutely devoid of structure—that is to say, of any structure except the molecular structure possessed by all colloid matter; an organism which is not a cell itself, and does not contain either cells or nuclei! Well does Prof. Huxley remark: 'Its existence proves life to be a *molecular* property, and shows that organization is the product of life, not life the product of organization.' If the properties of water may be properly said to result from the nature and disposition of its component molecules, I can find no intelligible ground for refusing to say that the properties of protoplasm result from the nature and disposition of its molecules."

Telegraph Wires During Auroral Displays.—In reference to the currents produced in the wires during auroral exhibitions, *The Journal of The Telegraph*, says: "Although there are, unquestionably, large masses of electric clouds sailing in the upper regions of the air during the presence of these displays, yet the fact that all, or nearly all, interference form the currents then exhibited can be prevented by simply using two wires instead of the earth and wire, proves that these currents are caused by a disturbance of the earth's electric state. Its ordinary electric tension is disturbed, and its currents are, so to speak, scattered by this induced current from the vast masses of electricity in the sky, but are ever seeking to restore themselves to their normal condition; thus causing temporary electric currents of great power and rapid changes of tension. Thus they enter a wire from one earth connection in this effort at restoration, and are chased ack by another current from the opposite end, exhibiting the violent and changeful currents which mark these magnetic storms. The earth, itself, is a great reservoir of electricity, offering no sensible resistance to the entrance of electrical currents, yet varying in its electric tension at different points. This causes an almost ceaseless action of the currents, and at almost all times they can be felt upon the wires which they use to effect the equalization. During the auroral displays this action is excessive. At the same time it can scarcely be regarded as incorrect to say that it is the induction of vast volumes of electricity from the upper air which causes these currents; and as a line can be worked by any polarity, provided the wire is worked with a like polarity, the changing currents do not prevent the line from being operated during the violent contest for the supremacy of the one current or the other."

Nature of Comets.—M. Bionne has submitted the following opinion upon the nature of comets to the Academy of Sciences: "Comets are bodies which describe spirals originating in a nebula terminating in the sun; each spiral may be considered as an ellipse. Formed of the incandescent matter of the nebulæ, comets would appear to be the regulators of the grand movement of celestial bodies, the agents of that vast transformation of calorific work into mechanical work, and would come at the end of their course to lose themselves in the atmosphere of the sun, to which they would serve as an aliment."

Farming and Gardening.

The Fowler Steam Plow.

The only steam plow which appears to bave met with any marked success in England, is that invented hy Mr. John Fowler, of Leeds, which is constructed upon the principle of a direct pull upon the implement, as in ordinary plowing. This plow is constructed in gangs, and is dragged across the field by a locomotive engine, which is moved along one side of the field. An "anchor," or vehicles with sharp wheels cutting deep into the ground, is moved upon the opposite side. An endless wire rope is passed from the engine over a pulley on the " anchor," and hack to the engine. The plow is attached to tbis rope, and dragged from the engine to the pulley, there reversed, and brought back to the engine. It is a halance plow, supported on two wheels in the center—one set of plows taking the ground when going one way, and the other set when going the other way, balancing upon the axle hetween the two wheels as a pivot. The engine and anchor are moved ahead with each trip of the plow. The cost of one of these plows is from $8,000 to $10,000.

One of these plows was received in this country, some three years ago; and so important was the enterprise considered, as leading the way to the introduction of steam plowing in the United States, that the duties on the plow were remitted hy especial act of Congress. This plow is now in successful operation on the sugar plantation of Mr. H. E. Lawrence, ahont forty miles below New Orleans. It turns the soil, when required, to the depth of from 12 to 14 inches; and two hands are sufficient for its management.

In addition to the plow there is also a scarifier or cultivator, designed for light work; an extra strong gruhher, for eradicating roots and stones, and a harrow; the two former being constructed, like the plow, as balance machines. There is also a suhsoil plow connected witb this invention, whicb will enter a stiff clay soil to the depth of from two to twenty-five inches—six in a gang—with coulters baving palms as large as a man's hand.

An interesting trial of one of these machines was made about a year ago on a large farm of 32,000 acres, helonging to Col. W. C. Patterson, near Burlington, N. J., and in the presence of the Commissioner of Agricultnre, and nnmerons other gentlemen largely interested in agriculture. The trial was continned for several days, and gave very general satisfaction. This plow has been used there for some two years. The one employed consists of twelve plows—six working in a gang, and is driven by two 14-horse-power engines, one working at each side of the field, instead of nsing an anchor on one side. The length of furrow is sixty rods; breadtb oultivated at one movement, 6¼ feet; depth eight inches. From 18 to 25 acres, according to the nature of the ground, can be plowed in twelve hours.

Tbere is another of these plows at work upon a Western farm, the looality of which we are not acquainted with. It may not be out of plaoe to state that tbe principle upon which this machine is oonstructed was first applied to an American iuvention more than thirty years ago.

Arboriculture, scientifically pursued, is one of the most pleasing occupations which man can follow. In the latest published report of the British Association for the Advancement of Science, it is stated that even in that *cleared* country, trees occupy one-twenty-second part of its entire area; that to every eleven acres of cultivated land there is one covered with wood, and one acre to every sixteen uncultivated. The gross annual value of the wood crop is estimated to rise up to $12,500,000.

A California Dairy.

A Monterey correspondent of the *Bulletin* describes a dairy in the Salinas valley, helonging to Mr. C. S. Ahbott, where *nine hundred* cows are milked. This dairy is only ahout three years old; is described as heing laid out and conducted on the most approved system, and is said to be a complete success.

If the description is correct, this is prohably the second dairy, in point of extent, in the United States. The locality of the first we have not just now at hand, but what has heretofore heeu pronounced the *second* in size, helongs to O. F. Leser & Co., and is located a few miles back of the city of St. Louis. As there are only 800 cows milked at that estahlishment, it must stand hehind our big California dairy; which, in all prohahility, is the second in point of size in the Uuion.

It is one of the most incomprchensihle things connected with the agricultural interests of this coast, that we should import even a single pound of hutter from the Eastern States—much more that we should receive from that source over one-half of all we consume. During the past week no less than 1,794 firkins of Eastern hutter have reached this city, from New York, by steamer; while over 60 tons additional, have been received at Sacramento, by railroad, for Chicago. Why is it that one of the finest grazing regions in the world cannot furnish its own hutter, when the producers are protected by a transit of over 2,000 miles of railroad in one direction, and more than 5,000 miles of steamship carriage in the other?

We trnst that the enterprise of Mr. Abbott will serve to convince our farmers that there is money to be made in every well conducted dairy that may he properly estahlished ou this coast, until the aggregate supply exceeds the entire demand for butter and cheese, this side of the Rocky mountains.

A New Agricultural Section.—The Oregon *Farmer* learns from a private letter that "a party of three men recently made a prospecting trip into the interior of Clatsop County in search of minerals. They did not discover any thing of that kind which they believed to be valuable, hut they found some very good country for settlement. One of the party, through whom we received this information, has resided iu Clatsop county for twenty-five years. 'There is very little yet kuown of the interior of the county." Clatsop is the extreme northwestern county of Oregon, lying on the south side of the mouth of the Columhia and bordering some 35 miles on that river, and about the same distance on the Paoific Ocean.

A Canvas Corral.—The Oregon *Unionist* describes, as follows, something quite novel, and which, under some circumstances, must be of great advantage to sheep-growers: "The Salem Bag Factory has brought out a canvas sheep corral. The enclosure made by the oanvas is 150 feet square, and 3½ feet high. The herders will carry this with them, and when night comes, they stretch it and drive the herd into it. It is estimated that a pen of one hundred and fifty feet square will hold a thousand sheep."

Grafting Potatoes.—The latest novelty in the fancy line upon the farm is grafting potatoes. The mode of operation is as follows:—Take one of each variety, the good qnalities of which it is wished to combine; with a pocket knife cut all the eyes clearly out of one of them, and substitute in their places the eyes cut out of the other. The eyes to he iuserted should he sprouted and cut in the same shape and size in the other potato; they are held in place by hair-pins, and bound with bass matting or twine. The fit must be exact, and the rind of each must just meet. The grafted potatoes are then to he planted. As some of the grafts may fail, it is well to operate on a dozen or more sets at a time. The produce of these grafted potatoes are to he kept separate and planted out the following year, when their qualities will be proved. Many varieties will sometimes result from graftiug only two kinds into each other, and the results are said to have astonished the originator of the system, as two reds "have produced a white potato." Kidneys and rounds grafted into each other produced rounds, mottled aud kidneys, differing from hoth parents.

Cows, Horses and Sheep fed on Fish.

Farmers on the shores of the State of Maine have taught their sheep to live on fish. They report to the Agricultural Society that a single fish makes a meal for a sheep; that it is eaten with relish; that it fattens and keeps tbe animal in fine condition. Nothing is said of the effect produced upon the wool or the flavor of the meat; which the latter we suspect to be no improvement. Nor is any remark given on chewing the cud. To many stomachs, mutton in its best estate tickles the wrong way. We are not squeamish, hut carnivorous mutton would need a deal of saucing to grease tho incline to our bread-basket. *Exchange.*

The above, printed under the head "New Food for Sheep," which is going the rounds of the press, may be new to the stock-growers of the United States; hnt it is an ancient and very common practice in some portions of the world, where grass is particularly scarce. Fraser, in his "Travels," notes the fact, and says that in some portions of Western Asia, fish forms the chief article of food, not only for sheep, but for cows and horses, as well. The fish are dried, pounded and sparingly sprinkled with salt. The cows become very fond of snch food; which is often mixed with other suhstances, sometimes with pounded date stones. The natives assert that the flavor of the milk is not at all injured by this diet; but that the cows drink much water and thereby greatly increase the quantity, without in the loast diminishing the quality. Sheep and horses thrive equally as well as tho cows.

What the effect may he upon the flavor of the meat, we are not told. We shonld snppose, however, that the mode of mixing water with the milk, indicated above, would he much preferable to that so greatly employed in this country.

California Grain to Europe.—It is mentioned, by the Eastern papers, as a singular fact that California is ahle to send grain to Liverpool cheaper than any State of the Mississippi Valley. The chief reason why wheat can he produced cheaper here arises from the fact that the average yield in California is about double the yield per acre of the Western States; while the cost of taking 30 hushels from an acre is bnt a trifle more than that for planting and harvesting 15 bushels. If onr farmers would, by careful cultivation, increase our average yield per acre, as they might do 50 per cent. over that at present realized, the clear profit to growers would be increased fully one-half of that per cent.

The Government Agricultural Report for May and June, shows a high average condition of wheat throughout the country, while other grains are also promising well. The corn crop is not so flattering. The cotton crop, it is thought, will bo so mnch increased as to materially affect the price. The good weather, of late, has produced a wonderful and most favorable change in the prospect of this crop. The prospects of the fruit crop, are also, as a general thing, favorable. The *American Agriculturist*, generally well informed on such matters, expresses substantially the same opinion in its July issue.

A New Potato Growing from an Old One.—A correspondent of the *American Agriculturist*, sends to that paper, from Virden, Ill., an old potato, with a new potato growing from its side. That paper says such a thing is nothing new; but often occurs when potatoes are kept sufficiently warm to start into growth, and are kept perfectly free from light.

Items in Brief.

The Wheat Market.—California Wheat was quoted in Liverpool, on Saturday last, at 10s. 8d.—ahout four cents higher, per cental thau last previous report. Wheat growers will do well to watch, closely, the European quotations.

Wheat Exports.—Onr Wheat exports for the past three years may be stated, in round numbers, as follows, commencing with 1866-67: 5,100,000 centals; 5,050,000 centals; 5,750,000 centals. It may now be safely asserted that the exports for 1869-70 will materially exceed the latter amount.

Wheat on the Banks.—Large quantities of wheat are said to he waiting upon the banks of the interior rivers, and elsewhere, for transportation to this city.

Tall Oats.—Mr. Fairfield, Snperintendent of the Round Valley Reservation, is raising a species of oats, unlike anything hitherto seen in this region. The stalks are seven feet high, three qnarters of an inch in diameter, with laterals two feet long. The heads measure from two to three feet on the stalk. The seed was received from the Patent Office.

Tall Wheat.—They are raising wheat on the Pauay Ranch, near San Diego, six feet high, with large plump herries; 600 acres of wheat it is thought will average 45 hnshels to the acre. This, it should be recollected, is iu a region which has hitherto not been considered very favorable for wheat growing.

New Melon Seed.—Dr. Holden, of Stockton, has received some melon seed from the Agricultural Department, said to be choice and new. They came to hand too late for planting this season. A variety known as the Ioniau melon, was purchased ahroad for the Department at a cost of $120 per pound. Our consuls in all parts of the world, are especially active at this time in their inquiries for new and valuable varieties of seeds and plants, for transmissiou to Washington, from whence they are distrihuted through the country.

Good Yield.—A field of harley has been harvested, on the Honecut, which yielded 48 hushels to the acre.

Sale of Barley.—Some 200 tons of new harley was sold at Sacramento, on the 3d inst. for $1.02 per cental.

Apricots, measuring 7¼ inches, 'have been raised in the Chico Farm orchard.

Roses on Apple Trees.—An Illinois horticulturist grows roses on apple trees.

Mountain Strawberries.—A resident of Nevada City has received $140 for strawherries, raised upon a piece of ground 100 feet square, in one month.

Mountain Grazing.—Large droves of stock are heing driven into the mountains, in all directions, on acconnt of tho scarcity of food on the plains.

Flax in Santa Cruz County.—The Watsonville *Pajaronian* of June 7th says: "Peter Storm, who lives just outside the town limits, has a field of sixty-five acres planted to flax, which is growing finely, and will give a large yield of seed and straw. Mr. Storm has contracted to sell all of his flax straw at $50 per ton to the San Lorenzo Paper Mills, and other parties have agreed to take all the seed raised at four cents per pound. One acre of land will yield from two and a half to three tons of straw, and ahout 1,800 pounds of flax-seed. Tbns it will be seen that flax-raising is much more profitable than wheat growing.

Ripening Wines hy snhjecting them to a high temperature has been tested hy a numher of Los Angeles grapegrowers, and in every instance has proved successful. Mr. Keller maintains a temperature of ahout 130° in his wine house, by keeping fires burning constantly for months. The improvement in wiue so treated is so marked as to leave no room to douht that in one year ripening is advanced equal to four or five years by the ordinary let-alone way.

A Large Cucumber.—The longest cucumber, says the Sutter *Banner*, we ever saw was shown to us a few days since hy Mr. E. R. Reed, which measured three feet and six inches in length, and seven inches in circumference.

Ozone—The Great Coil.—The coil, is probably destined to throw new light upon scientific research, and to solve the problem—what is ozone? In reference to the amount of this element, and the density at which it may be produced, very few experiments have as yet been made. But enough is seen in the extraordinary reddening effect of the flame of the spark on litmus paper, to show that we are likely very soon to solve the ozone problem.—*Mechanics' Magazine.*

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, July 17, 1869.

Financial.

The monetary pressure which has obtained in our local market for the past three months may be said to have nearly passed away. Money is obtainable in bank at 1@1½ per cent. per month. The payment of the half-yearly dividends by the Savings and Loan institutions, amounting to over $800,000, has made money easy among the depositing classes; while the securement of several millions in England, at British rates, say 4 per cent. per annum—here worth 10@12 per cent.—will afford the requisite facilities to move the incoming heavy crops. In all other respects the financial horizon has been measurably freed from the clouds lately hovering above it, and preventing clear observations for future guidance. The healthy monetary condition of the interior may be considered a reflex of the improved condition which has taken place in the metropolis. The Sacramento Savings Bank recently declared a dividend of one per cent. per month, amounting to about $75,000, for the six months ended July 1st; but the depositors, with one accord, declined drawing their dividends, leaving them to be added to the principal; in addition to which, fresh deposits amounting to about $10,500 were made on the same day. This one incident sufficiently demonstrates the favor with which Savings and Loan Societies are received in California, and indicates an early and marked extension of their beneficial effects to other towns and places in the State, where their presence is needed.

Government now has, locked up in the vaults of the Assistant Treasurer, in San Francisco, the handsome little sum of $13,000,000; and we desire to call attention to a gross piece of neglect toward its employés on this coast. This is the third month since the Custom House officials have received any pay. The majority of them are by no means in a condition to wait for so long a period. Their salaries, at best, are not adequate to the amount or importance of the work performed. There is no better regulated institution of the kind in the Union; none in which more system and order are observed; and it is wrong, inexcusable, that the employés should be compelled to part with their pay accounts at a loss of from 5 to 10 per cent., in order to subsist. Most of them are gallant and meritorious officers of the late Volunteer Army, and have demonstrated their devotion to country on many a sanguinary field. They deserve and should have more efficient recognition. Were the Treasury hare of money, the case would be different; but with $13,000,000 idle in this city, the neglect appears inexcusable. We trust that Mr. Bontwell will give the matter early and efficient attention.

The Branch Mint closed on the 10th inst., to make a settlement, and will reopen shortly under the new direction.

Bullion is in rather short supply, with a more active demand than at the date of our last issue. Gold bars are quotable at 870@875. Silver bars are at par. Currency bills on Atlantic cities pay 34⅛@34¾ per cent. premium on gold. Coin drafts pay 1¼@1½ per cent. premium. Telegraphic transfers, 1⅛@1¾ per cent. premium. Sterling exchange, 48¾d. Commercial exchange, 49¼d. There are no Mexican dollars in market. Gold in New York, July 15th, 136¾; Legal Tenders with us, 74⅛@ 73¾.

City Stocks.

We have to report a continued dullness in the miscellaneous share market. Sales of Spring Valley Water stock were made at $64@64 75, and San Francisco Gas at $80 per share....The California Steam Nav. Co. disbursed their usual dividend of 1 per cent. per month on the 15th inst....The California Insurance Co. disburse a dividend of 2 per cent. per month for the quarter ending June 30th....The Union Insurance Co. pay 1 per cent. per month for the three months just closed. Their total assets are stated to be $1,012,766, and the net surplus, after allowing for re-insurance and other claims, $141,961.... The Fireman's Fund Insurance Co. paid a dividend of 1 per cent. per month on the 16th inst. for the quarter ending June 30th; and the Home Mutual Insurance Co. will pay a dividend of 1 per cent. on their capital stock on the 20th inst....The Bank of California announce their usual dividend of 1 per cent. for the present month. The Farmers' and Mechanics' Bank of Savings disburse a dividend of 10 per cent. per annum, free of Federal tax, for the first six months of the current year....On the 15th inst. the Omnibus Railroad Co. paid its usual monthly ½ per cent. dividend ...The State Telegraph Co. paid a dividend of $1 per share on the 15th.....The French Savings Bank has declared a dividend of 11 per cent. per annum for the six months just closed, payable on and after the 19th inst.

Mining Share Market.

The mining share market has been somewhat less active during the past week, but the number of stocks dealt in proved equally as large as heretofore. In a number of instances prices have been well maintained, while others show a slight recession, and altogether the market may be considered less firm as compared with the transactions of the previous week. Very considerable sales of White Pine stocks have been effected in the open market, showing that increased interest is taken in this class of securities.

CHOLLAR-POTOSI—attracted increased attention at fair prices. From the annual report for the fiscal year ending May 31st, we learn that the company extracted 44,900 tons of ore, giving an average yield of $23 70 per ton, the cost of extraction, reduction, etc., being $21 09, leaving a net profit of $2 61 per ton. We condense the following statement of receipts and expenditures from the Secretary's report:

RECEIPTS.

Bullion	$1,152,303 37
Ores sold	29,989 33
Premium on bullion	2,849 22
Superintendent's account	3,074 37
Sundries	2,849 50
Cash on hand per last statement	110,148 35
	$1,301,210 14

EXPENDITURES

Dividend	$11,595 00
Labor	248,663 00
Hardware, etc	34,414 54
Timber and Lumber	36,036 06
Firewood	18,953 49
Reducing Ore	636,578 27
Taxes and Legal Expenses	9,148 00
Truckee Railroad	75,000 00
Freight	7,213 43
Assaying	3,047 12
Materials	6,193 87
Sundries	25,066 20
Cash on hand at date	108,991 35
	$1,301,210 14

During the week ending July 9th, 1,410 tons of ore were extracted, against 1,660 the previous week. Of the above amount 670 tons came from the Blue Wing stope, and 460 from the New Tunnel developments. The faces in the Blue Wing stopes are reported to look promising. No change in quality of New Tunnel ore; the average assays from car samples show $72 to the ton. The shares of this company have been changed from 2,800 to 28,000, and the incorporate value from $2,000 to $100 per share, making ten shares to the foot.

OVERMAN sold to a limited extent. From the annual report closing with June, we learn the following:

RECEIPTS.

Bullion	$358,863
Ore sold	5,059
Assessments	140,267
Wood ranch account	28,078
Sundries	4,446
Cash on hand July 1, 1868	52,184
	$590,470

DISBURSEMENTS.

Reducing ores	$290,936
Labor account	117,095
Wood ranch account	61,416
Lumber, etc	66,105
Salaries	8,321
Sundries	38,655
Cash on hand July 1, 1869	8,032
	$590,470

The average yield of 22,261 tons of ore reduced during the fiscal year was $16 12 per ton. The officers for the ensuing year are as follows: M. J. McDonald, President; David Fay, A. Homme, Louis Vessarla and W. R. Parkinson, Trustees; T. J. Owens, Secretary; Joseph A. Myrick, Superintendent.

SAVAGE—has been exceedingly active during the past week. The annual meeting was held on the 16th inst., and from the Secretary's annual report we condense as follows:

RECEIPTS.

Bullion product	$1,949,925
Premium on same	4,875
Ores sold	15,919
Tailings, etc	6,323
Cash on hand July 1, 1868	106,329
	$2,083,362

DISBURSEMENTS.

Dividends	$751,575
Reduction of ores—custom mills	145,936
Reduction of ores—company's mills	145,447
Labor	284,769
Salaries of officers	20,022
Virginia and Truckee Railroad	75,000
Timber and Lumber	50,549
Fuel, Wood and Coal	53,636
Hardware, Candles, etc	26,025
Assaying	10,939
Taxes	19,529
Sundries	45,749
Cash on hand July 1, 1869	47,395
	$2,083,362

$150,000 was subscribed towards the completion of the Virginia and Truckee Railroad. The amount of ore on hand at the mine July 1, 1868, was 1,683, and on July 1, 1869, 121 tons. The ore reduced during the year amounted to 56,479 tons. The amount of ore sold was 15,363 tons. The cost of production and reduction, yield and profit of the ore reduced during the past year compares as follows with the two preceding years:

	Production.	Reduction	Total.	Yield.	Profit.
1866-7	$7 91	$14 04	$21 95	$41 84	$19 89
1867-8	7 21	13 74	20 95	40 84	19 89
1868-9	8 90	12 22	21 12	34 87	13 75

The amount of ore reduced in 1866-7 was 69,377 tons; in 1867-8, 84,627 tons, and in 1868-9, 55,479 tons. The receipts and disbursements for the past three fiscal years compare as follows:

	Receipts.	Disbursements.	Cash on hand.
1866-7	$2,935,875	$2,898,183	$77,716
1867-8	3,560,834	3,502,230	106,320
1868-9	1,977,042	2,035,967	47,395

The monthly dividends disbursed by the company for the same years were as follows: In 1866-7, $880,000; 1867-8, $1,660,000; 1868-9, $968,000. From date of organization the amount of ore taken from the mine has been 339,808 tons; reduced, 324,317 tons; gross receipts in bullion and from ore sold, $13,304,740; assessments levied, $188,000; and dividends disbursed, $4,528,000. The available assets of the company at the close of the fiscal year were $90,803, against liabilities of $2,655. The property assets of the company aggregate $256,000, as follows: Savage and Atchison mills, $90,000; E street shaft and works, $150,000; buildings at Virginia, and assay office, $16,000.

HALE & NORCROSS—was moderately dealt in. For the week ending July 10th, 154 tons of ore were extracted from the upper mine, and 578¼ from the lower mine, making a total of 732¼ tons for the week, against 1,321 tons the previous week. They delivered 644 tons to custom mills; on hand, 2,011½....IMPERIAL levied an assessment of $5 per share on the 14th inst; office removed to No. 20, Hayward's Building....A dispatch to the *Daily Herald* states that it is likely that YELLOW JACKET will levy an assessment of $10 per share after the annual meeting, which takes place on the 19th inst....GOULD & CURRY is quiet. During the week ending July 12th, 248 tons of ore were extracted, average assays from car samples showing $51 40 to the ton....On the 12th inst. the OPHIR was in a distance of 428 feet....KENTUCK yield of bullion for the quarter just closed amounted to $42,684. ....EMPIRE yield of bullion—April, May and June—$46,225....SIERRA NEVADA reports a bullion yield for the quarter just closed of $55,139. The stock has been changed from $500 to $200 per share, and the number of shares from 3,000 to 15,000, making five shares per foot.

DR. HALL has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Newlz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18-3m

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

To News Agents.

From July 1st, 1869, News Agents desiring five or more copies weekly of the MINING AND SCIENTIFIC PRESS, will be furnished direct from the office, at a reduced price from former rates. Orders for a less number can best be supplied through San Francisco wholesale agents.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

The *Miner* condenses a letter from a man who has traveled extensively in South America and Mexico, and who recently inspected the Tarshish mine and others in Alpine. He prophesies that all the small locations will he sooner or later abandoned or sold, but the regular organizations, with capital will succeed, and this section will within five years produce as much silver as the State of Nevada in its best days.

Pennsylvania.—It worked about $7 per ton. Such is the reluctant answer we have finally obtained to the question, what was the hullion result from the ton of Pennsylvania ore recently sent to Washoe.

Splendid indications in the Globe tunnel this week.

AMADOR COUNTY.

The *Alta's* mining summary for the half year, says: The returns of the Amador mine for June have not yet been received, but the average gross yield had been about $63,000 per month from Febraary to May, iuclusive. At the present rate of production the mine will turn out nearly, if not quite, $750,000 for 1869. The production for the first five months of this year was $47,861.53, $65,670.98, $61,720.65, $66,-346.52, and $61,576.70. The number of tons reduced averages about 2,950 per month, every ton yielding more than $20. The dividend for each of the last five months was $10 per share.

CALAVERAS COUNTY.

Petticoat.—*Chronicle*, July 10th: Rich rock has again been struck iu the Petticoat and the mill will soou he running. The shaft is sunk to the depth of 200 ft.

Rich Rock.—Fifty tons of rock, taken from a lead owned by Mr. Hopper, at Railroad Flat, crushed iu Smart's mill, yielded 93 ozs.

INYO COUNTY.

Letter from Independence, June 21st: The Kearsarge Co. are working 10 men, taking good ore, but will not start their mill for some time. Mr. Passmore is now running the Silver Sprout mine. He is taking out good roek and will start the mill about the 6th of July.

In Cerro Gordo District they arc going ahead at an astonishing rate. One mine, the Ignacio, was sold to-day for $24,000. Belshaw & Co. are smelting ont from three to five tons of crude hulliou per week. Sympson & Co. are getting three tons of ore per day to the drifter, and will inerease the number of drifters to 30. They sell their ore to Belshaw & Co. for from $6 to $15 a ton.

Cerro Gordo.—From the Los Angeles *Star*, July 10th: Wm. Eakin and Jesse Avers arrived last Saturday from Cerro Gordo, the former bringing 96 bars of metal, weighing three tons. This metal is rieher than any heretofore brought to our city. New mines are being located every day, Four new furnaces are nearly completed, while there is ore enough, easy of attraction, to give employment to 100.

MARIPOSA COUNTY.

Hunter's Valley.—*Mail*, July 9th: Parties working the Oakes & Reese mine, at Hunter's Valley, are about making extensive improvements. Twelve new stamps, and a new engine at the hoisting department, are heing eonstrncted—making it a 28-stamp mill. From 80 to 100 men are employed. Work has beeu recommenced on the Floyd veiu. The use of the Giant powder, coupled with the eoutract system with the miners, makes a wonderful percentage in favor of all parties interested.

Running.—The Mariposa Co's new 25-stamp mill, on the Merced river, is now running—making 61 stamps now in operatiou for the eompany. These mills are crushing rock from the Josephine and Pine Tree veins, and are operating with the dry crnshing proeess. The eompany has also commenced work at the Mariposa mill, running 25 stamps.

NEVADA COUNTY.

Allison Ranch.—Grass Valley *National*, July 6th: Work at this mine is diligeutly proseeuted. The large pumpiug engine is to be removed from the south to the middle shaft. Excavations for the fonndatiou have beeu made, and workmeu commenced laying the stoue to-day. The new pole, sixteen inch, Cornish puup, will he put in at the boh level. Below this will he the fourteen iuch pump at present iu use. Each of these puups has a vertical lift of 160 feet. Some exeellent rock is being taken out from that portion of the miue known as the Cariboo ledge; fully up to the old standard of the Allison Ranch ore. None has yet heen crushed.

Union Hill.—We chronieled last week the cleaning up of $4,000 from the plates, and yesterday gold to the amount of $10,000 in addition was brought in.

Greenhorn.—The lessees have been working three months, and had three clean-ups, the poorest of which yielded at the rate of $16 per ton, exclusive of sulphurets. They are down 70 feet on the line of the ledge. Rock is heing crushed at Laton's mill at Union Hill, which is paying $20 per ton. There is very little water in the mine. For the present, all the hoisting is done with a windlass, by hand. Two men have taken out 45 tons during the last month. The ledge is now from five to seven feet in thickness. It is in contemplation to ereet steam hoisting works and put up a ten stamp mill.

Dromedary.—Same of 7th: Parties working the main ledge of the Dromedary mine on shares, had a crushing yesterday of seven tons of rock from the hundred-foot level, at the Gold Hill mill, which paid $182. The same of 9th says that nine tons from the 300 foot level had just yielded $440—$49 per ton. Better rock still, is in sight.

Mutual.—9th: This miue is four and a half miles east of Granitevillc. An incline shaft, 125 feet in depth has just been completed to the tunuel. The shaft is 14 feet in diameter in the clear and strongly timbered. They will start their mill within ten days. The ledge is well defined, three feet in thickness, and shows well in gold and sulphurets.

Brown's Hill.—Williams & Co. have worked most of the time this season. Their average elean-up for a two weeks' run is $1,509. Browu Bros. have completed a drain tunnel and will start their eement mill next week. When the mill is running, they clean up from $2,000 to $3,000 per week. Neece & West have just completed a tunnel, and are now running powder-drifts. They will use 200 kegs at a hlast. The hlack powder is employed.

Empire.—Grass Valley *Union*, July 8th: The Empire mine is again going ahead with a full working force.

Same of 13th says: "Up to yesterday afternoon the Empire mill had run eight and a half days, and cleaned up over $19,000, When the night shift were to go on, only five pairs of men presented themselves. The assassinations of Saturday night had intimidated the others so that they would not work. The slungshot and the bludgeon rule in this vicinity, and the rule seems to be suhmitted to with a spirit, at once meek and iuvitiug more violence. Sunday night another man coming from the Empire into town was attaeked by three men, and was eompelled to take refuge in a house by the roadside, where he remained until day-light. Havo we any men iu this eommunity who dare assert themselves as on the side of law? If any snch there are, let them speak, and that too so they will be heard."

Deer Creek.—*Transcript*, 9th: There are not less than fifteen Chinese eompanies at work, giving employment to between two and three hundred of their countrymen. There are besides, a eompany working Little Deer Creek and one in Gold Run. White men have worked these over and over, and then sold them, at good prices, to Chinese eompanies, who appear to he doiug well. We know of one instance where they paid $2,200 for a creek elaim considered almost worthless, and they are now putting in expensive works to open it up in a proper mauner.

Magnolia.—10th: The proprietors are running a tunnel from Mosquito Creek, which will strike the lead about forty feet lower, giving them backs of eighty feet. They have out about twenty tons at the shaft, which looks well.

Oriental.—The Oriental Mill is running upon a lot of roek from the ledge of Beasley & Co., up Deer Creek. The roek looks well.

Above the Cascades.—11th: Several eompanies are prospectiug ou Upper Deer Creek. One man contraets to rnn a 200 foot tuunel, and thoroughly prospect the ground, for one-half the claim.

Eureka.—The *Alta's* semi-annual Miniug Review says: The Eureka Mine produced in Jnne more than $47,000, of which, however, $4,500 were from sulphurets eollected in previous months. The total yield of the first half of the year was $285,109 14, from 9,000 tons of quartz, making an average of about $32 per ton. The expenses were $102,000, leaving $183,000, or more than $1,000 per day net, and $20 per ton net. The number of men employed is about one hundred and fifty.

PLACER COUNTY.

Murderer's Bar.—San Mateo *Gazette*, July 3d: The company now engaged with machinery on the upper end of Murderer's Bar, is Page, Down & Co. We learu that they expect to get their claim ready to work hy next Monday. The warm weather has kept the river high, but the snow on the mountains was getting scarce and the water was falling rapidly. Murderer's Bar is below the hridge on the west side of the river, and is supposed to be the old hed of the stream. The company spent last summer in experimenting with different kiuds of pumps aud machinery in trying to keep their shaft clear of water, and hy the time they had succeeded iu perfecting their work, the rainy season commenced and the company suspended work, secured their machinery and waited. They expect to take out gold by the pound.

PLUMAS COUNTY.

Argentina.—Qnincy *National*, July 3d: We firmly believe that the richest mine in the State of California is situated at Argentina, in this county, ahout ten miles from this place. Heath & Co. are now sluicing to the depth of forty feet, and it is paying them from an ounce to $20 per day to the hand. The gold-bearing earth consists of a vein about 300 feet wide, with neither length nor depth as yet determined. The rock is soft and varies in color from a dark brown to yellowish. The gold is found disseminated all through it in fine particles, though the richest places are found in the rusty seams. They break it up and run it through ground sluices and boxes for nearly half a mile.

A correspondent of the Santa Fé *Herald*, W. P. Early, speaks of the same mine, July 1st, as follows: "Messrs. Heath & Frecman discovered that their predecessors threw away the rock that contained the trcasnre, and worked the white quartz only, which is comparatively harren. The mine is 300 feet in width and over 1,000 ft. in length, and is kuown to he a continuous hody of rich mineral. The priucipal gold-hearing rock is talcose slate, the eolor heing a deep yellow. The talcose and quartz veins that course through it in every direction, are completely spotted with sulphnrets rich in gold."

SHASTA COUNTY.

Upper Sacramento Items.—Correspondeuce of the *Courier*, July 10th: Alexander McMullen & Co. are digging a race across a har on the Sacramento, three miles above Portuguese Flat, in order to mine the bed of the river in which they have found very rich prospects. The river has beeu wing-dammed in a numher of places, and gcnerally paid well. Frank Moore & Thomas Neal are engaged in a wing-dam enterprise just below the mouth of Slate Creek.

Hazel Creek is paying hetter than for ycars. McKenzie & Garrett, Johnson & Co., Keaton Brothers, aud others are making from $3 to $5 per day to the hand. The gravel on this creek is of a burnt reddish hue, and eontains any amount of porous quartz, some of which is very rich in free gold.

SIERRA COUNTY.

Giant Powder.—*Messenger*, July 10th: Giant powder and single-hand drills have heen in use at the Reis mine now for some time, and the verdict is that they save from thirty to thirty-five per eent. in the getting out of rock. It is also heing used at the Independence and Gold Bluff mines, and the Keyestone will put it into their tnnnel as soon as they can get men who thoroughly understand its use to introduee and instruct the workmen.

Arizona.

Montgomery.—*Miner*, June 28th: C. B. Genung has crushed, in his arastra, 2,500 lbs. of Montgomery ore, and A. J. Shanks says he saw $90 taken from the arastra. The arastra was a new oue, and it was thought that as much more worked its way down into the interstiees. The lode has widened, and is now four feet thiek.

Sterling. — The Sterling folks are trouhled with bad air. Work on the mill is progressing favorably.

Lynx Creek.—Ed. Bowers informs us that many miners were at work with rockers when he left, most of them making fair wages.

Upper Hassayampa.—It was reported in town yesterday, that a miner has taken out $300 in one week.

Early the present week, word was brought to town that a rich guleh had been struck in the vieinity of the Placeritas, near Walnut Grove, and that there were 24 Mexicans working in the gulch, roeking and panning. The latest news is that the Mexicans were making from $6 to $30 per day. ....We have heen told that a miner prospecting near Prescott, struck a gulch out of which he took $9.50 in a few hours.... There are on the Lower Hassayampa, between the two cañons, bars that prospect exceedingly well, still nohody takes hold of them. Geo. Moore says five cents to the pan has heen found in these bars. Plenty of watcr can he had there at all times.

Colorado.

Colorado against the World.—*Register*, June 24th: The Gilpin County and Coaley lodes, Silver Gulch, Black Hawk, are not only excelling everything in the silver line hitherto found in Colorado, but anything yet produced in the United States. The ores excel those of the famous Poorman lode of Idaho. For 100 ft. along the tunnel, the vein of rich ore appears. It is largely galena and zinc with masses of native silver, or metallic silver with not more than ten per cent. of other matter. We have samples of it in our cabinet, and there are pieces of ore of the same character which Goodspeed offers to any one who will lift them, lying at the mine.

Items.—Linden Castle lode has been opened to a depth of 85 ft. From the surface down it presented galena which assayed 48 ozs. of silver per ton. For 10 or 15 ft. down the vein is well defined. From the hottom we took ores for assay which gave us 107.4 ozs. of silver worth $139.62 in coin, and no gold. At the top, the ores as reported, assayed from 48 to 50 ozs.... Messrs. Woodhury & Co., have been erecting at their mill a water wheel 23 ft. in diameter and four ft. breast.

Chicago Creek.—A hole 12 ft. deep on the Kremlin, produced three tons of snlphuret ore, selected samples of which assayed upwards of $1,700 per ton, and a quantity taken for an average, $368 per ton.

The Plymouth Rock is another promising lode. They have opened only about 10 ft. deep, hut it shows rich sulphide ore. Clark, Sisty & Co., are opening a new discovery that looks well. The vein is a very large one, and the croppings assay over $100 per ton.

Warn District.—June 25th: Edward Learned, President of the Ni-Wot Co., contemplates organizing a smelting company for working the ores of Boulder County, with a capital of $200,000. The Edgehill mill is now making good runs. Only one idle mill in the district, and we hope to have that in motion soon. On the Stoughton, Mr. Thompsou is again at work. The mine is in rich pay. Geo. Worth & Co. are working their East Columbia mine, disclosing a wide crevice of rich smelting ore. "Patch Diggings" have been discovered and claimed up on the slide of the Nelson lode. Gulch mining is carried on to Rhoad's Gulch. Down the creek (left hand) Erick Bottelson's 10-stamp mill is doing a good husinccss. He is crushing from tho Horsefall, ou Gold Hill, six ozs. of gold per cord. One mile below, Capt. Hall is putting in a first-elass arastra, and further down, Strock has an arastra running.

At Jamestown the hig mill of the Boston Co. is about ready for the maehinery. Eight or ten arastras are constantly at work, ohtaining $75 to $100 per eord. Wilson's arastra is getting $100 per eord from Star of the West lode. First-class ore in the Hoosier, hut no improvement in the management. Parties are sluieing in "Doe's Guleh."

Georgetown.—The Baker Co. are pushing work on their new furnaee, and preparing to put a large force of miners into their mine, which has improved greatly, both in quantity and quality of ore. On Saturday last the Brown Co. shipped 350 ozs.; and Mr. Stewart, 125 ozs. of silver.

The Marshall tunnel will cut all the main veins on Leavenworth and Burrill mountains. It is now in about 230 ft. Crow & Clark will he ready to hegin drilling again in a few days. Mr. Snyder is erecting a frame house near the Snowdrift lode, for the aeeommodation of his hands. He is working eight. Cooper & Fisher are preparing to resume work on the Astor. Chamberlaiu & Black have snnk a shaft on the Chamberlain lode 80 ft., and are runuing a eross-cut to strike the veiu at a depth of 150 ft. The lode proves extensive and rich.

Daily.—The prospecting season is fairly open. Daily Distriet is the center of attraction. The people elaim that the ore can he treated hy raw amalgamation. If this is a fact, Daily District will outstrip any other in Colorado.

Items.—On South Clear Creek mining has eeased for the time, owing to high water....C. L. Bradley has started his new mill in Russell Gnlch....Cheney has made a very fine run from ores of the Bobtail Co's miue; 28 ozs. per cord....Creighton lode ores, yield an average of eight ozs. of

gold bullion to the cord, the cost of crushing and mining being $2¼. This yields a net profit of about $121 per cord.

Idaho.

Potosi *Avalanche*, July 10th.—C. S. Peck & Co., have resumed work on this mine. The shaft is down 110 feet and the lodge looking well.

FLINT DISTRICT.—Warnkee, Swartz & Co. crushed two tons of ore from the Sherman, not specially selected, at Black's Mill, which yielded $538.

MINEAR MILL.—This mill is running on Hamilton rock....The rock of the Sherman ledge, Flint, has been tested within the last few days, and assays $260 per ton. The new hoisting works over the shaft of the Ida Elmore mine will be in running order by the 15th. The Ida Elmore and the Golden Chariot have connected their tunnels under ground, by which both mines are now well ventilated.

A new and very rich mine has been struck by Owen McMahon & Co. Free gold in sight. This mine is called the Dexter and is in French District, immediately south of the Peck & Porter.

The Red Jacket shaft is down 40 feet and indications favorable.

The water is being taken out of the Firelight, when a shaft will be sunk 100 feet

Tidal Wave, 6th: Black's Mill in Flint has started up on Leviathan ore this time. The ledge shows a width of nine feet, and two men are taking out ore as fast as two men can assort it....The Red Jacket has everything in good working order—shaft down 40 feet and nearly timbered—several tons of good milling ore on the surface in which free gold is visible.....Ida Elmore, never looked better since its discovery, a large lot of ore on the dump, and teams continually loading and hauling it to the mill. They are erecting a new engine house for the purpose of putting in heavier machinery for hoisting works..... The Golden Chariot mine is equal to its best days. The deeper they go the wider and richer.....The Baxter Company keeps on sinking in the main shaft with encouraging prospects. They are determined to put the shaft down another hundred feet, although they have plenty of good stoping ground above them.....The Silver Cord is showing as well as ever. Their shaft will be completed this month.....The Poorman has completed a shaft to the depth of 400 feet. Levels are already started and preparations made for running out an unusal quantity of rich ore. It is a rare circumstance that a blast is required, and the ore is as docile and easily handled as native gold in placers.....Prospecting is being pushed forward extensively on the mountain.

NORTHERN IDAHO.—Lewiston letter to *Wave* of July 9th: Everything is dried up about here. The Moose Creek mines are a failure. There have been a very few paying claims, but the ground is limited, and water scarce: The Chinamen are going there. There are more men in Florence than last year, but not as many in Warren's. In Oro Fino and Elk City reports give about the usual number of men. The placer mines will fall short of the usual yield, owing to the scarcity of water. There is some encouragement from the quartz mines in Florence and Warren's.

Montana.

A Helena correspondent of the Oroville *Record* of July 10th, says: Quartz mining is improving in all parts of the Territory, and when machinery can be got as easily as in California or Nevada, we will show as large shipments as either. The Whitlatch Union—named for the Quartz King of Montana—is paying from $30 to $40 per ton, and will continue for years fully as good. The Whitlatch Park Mining Co. is an extension of the same lode, and prospects better than the discovery. They will have a mill on it this fall, and no doubt will realize a fortune.

Nevada.

COPE DISTRICT.

From the Elko *Independent*, July 10th: There has been the usual fluctuations in Cope District stock that always attends the development of a new district. The first party that came in, gave glorious accounts. Then came the rush, followed by the return of the croakers. Time has now been given for the second, sober thought, and we can speak confidently. Tuesday, our townsman, O. R. Johnson, who is known to everybody as a man of cool, sound judgment, returned from a ten day's trip to Cope. He brought with him samples of the ore from the Argenta, Pioneer, California, Hamilton, and several other lodes, and we have not seen in our experience a finer lot of surface rock. The lodes he describes as being from four to ten feet in width, lying in granite, and giving every promise of permanency. We learn that Col. Frank Denver is now having three tons of ore from the Argenta worked at Dall's mill in Washoe,

Again, same date: A gentleman who left Cope District on the 3d inst., informs us that the excitement there continues unabated, in consequence of the daily discovery of new ledges. Twenty-one original locations are claimed to be separate and distinct ledges. Negotiations are now pending for the erection of reduction works on one of the mill sites. Cope District is destined to become a mining camp of considerable importance within a very brief period.

ITEMS.—Reports from Bull's Run of the most favorable character. The veins are from two to four ft. wide....A few days ago an immense quartz lodge, 20 ft. in width, was discovered 25 miles from town, and a few hundred yards from Mountain City road. The ledge escaped discovery by the prospectors, owing to the peculiar color of the croppings.

The *Alta* has an Elko telegram dated July 10th, saying: The Cope ore is similar to that of White Pine District. One ton crushed at the Washoe mills and worked by the dry process turned out over $600 to the ton.

ESMERALDA.

An Aurora correspondent of the Sacramento *Union* says, July 2d: A party passed through here this week who has located 20 claims in Deep Spring Valley, 25 miles northwest from Palmetto District. There are 50 miners at work, and this party, as agent for an English company in San Francisco to purchase a 20-stemp mill.

HUMBOLDT.

SHEBA MINE.—From the Elko *Independent*, July 7th; Seven or eight tons of ore were shipped from this mine to San Francisco a few days ago, which yielded, per assay, $475 per ton, and was taken at that valuation by shippers who intended sending it to Swansea for reduction.

An Eastern company has purchased the Register mine from Bonnifield & Coulter. The ore from this mine will be shipped to San Francisco.

Robert McBeth, of the Little Giant mine, in Battle Mountain District, has gone below to make arrangements for shipping a certain class of ore which cannot be worked satisfactorily at the company's mill. It yields on an average, $265 per ton, when there is twice that amount in the ore.

Large and well-defined copper mines are now being developed in this district, the ore paying from 40 to 60 per cent....The Yosemite mine, near Dun Glen, is yielding exceedingly rich ore, and in paying quantities....A great number of capitalists are now examining the Humboldt mines. Miners can sell their ore on the dump at good figures. The miners at Winnemucca continue to ship large quantities of ore.

REESE RIVER.

MINERAL HILL DISTRICT.—*Reveille*, July 10th: This is a new district organized at the locality whence came Mr. Northey's wagon load of ore, which worked at the Manhattan mill in this city, $550 per ton. Quite a number of our people have left for the district within the last three days, and more are going. It is between Cortes and Elko, 15 miles east of the mouth of Garden Valley.

HOT CREEK DISTRICT.—A letter to the Shermantown *Telegram* of the 9th, says: The New Philadelphia ledge has a 40-foot shaft and eight ft. of ore. The Wyoming has a shaft down 93 ft., and has produced 300 tons of ore. Of this, 100 tons gave a pulp assay of $123 to the ton; and a few assorted tons gave $417 per ton. The "Pure Metal" ledge is 100 ft. wide, and crops 50 ft. high for 600 ft. in length. I was shown several assays, that ranged from $110 to $3,000 per ton. The Gazelle, Silver Bright and Ingomar, are all undoubtedly rich. Present appearances indicate a bright future for old Hot Creek.

WASHOE.

[In the Stock Circular, in another portion of this paper will he found late mining news from this district.]

REOPENING THE MINES.—Gold Hill *News*, July 9th: The various drifts of the Crown Point, Kentuck and Yellow Jacket mines, are now being reopened; as the fire is supposed to be entirely extinguished. The 700-ft. level of the Yellow Jacket was reopened day before yesterday, and quite a strong gas has been coming from it ever since. It still has overpowering effects.

The old hoisting works over the north shaft of the Yellow Jacket have been completely overhauled, and the building repaired. They expect to commence hoisting water from the shaft by Monday next.

MINE STARTING UP.—The old Saucer mine in Gold Cañon, above Dovil's Gate, started up again yesterday. It has not been worked for a couple of years or more.

CROWN POINT.—It being considered likely that the fire in the upper levels of that and the Kentuck mine was at length smothered out, three of the closed levels next above the 1,000 were reöpened yesterday. The result is that the fire is found to be still burning, and an increase of gas and smoke is driven out through the Yellow Jacket. The drifts have to be closed again.

GOULD & CURRY is yielding about 50 tons per day from the upper levels. The heavy shaft of the pump engine, which was broken a day or two since, is not yet repaired or replaced, but will be, probably, by the first of next week.

WHITE PINE.

"Singlolue's" letter from Shermantown, in the *Enterprise* of the 11th, says: "White Pine never promised so well, or yielded so well, as to-day. There is not an idle stamp in the country—everything that will grind ore is in motion day and night, reducing rock which is not difficult to work and which is said to yield well. New stamps are being erected every day; and just as soon as a battery is ready to run the rock is on hand in abundance to feed it. From those stamps which are in motion, and have been in motion for from six months to six days, the bullion goes steadily away, to some country, in regular installments. I have seen, with my eyes, as much as a ton of nearly pure silver at one load going over the mountain from Shermantown to Hamilton."

WEEKLY REPORT.—*News*, July 10th: Owing to the festivities incident to a three days celebration of our national independence, but little progress has been made in the mines, and our bullion shipment for the week foots up but $61,299.19, being $10,719.27 less than last week. Aurora South, one of our leading mines, has been compelled to knock off 20 miners this week (having over forty left) on account of accumulation of ore without milling facilities. It is estimated that the present force will have between 1,500 and 2,000 tons of ore ready for the first run of Stanford's mill.

QUARTERLY REVIEW OF BULLION.—*Empire*, 11th: During the quarter ending June 30th, the following shipments of bullion were made from the Eberhadt mills, as shown by the assayer's books: From the Oasis mill, $167,096.62; from the Drake mill, $42,985.71; making a total of $210,082.33.

ITEMS.—*News:* Shaft on the Lexington 40 feet on the 9th....Paris mine has struck it in the south side of the incline....Metropolitan 1 and 2 improved as to ore, and ledge widens—will probably be a single ledge at greater depth.....Rich ore at 120 feet depth in the Genessee shaft of the Consolidated Chloride Flat Co.....Charles Mallet shaft 60 feet deep; work resumed.....Sinking commenced vertically in Eggleston & Brown on July 1st.....Rich chloride ore in the Pogonip and Othello struck July 1st.....Work re-commenced on the Jefferson on July 7th.....The west shaft of the Hidden Treasure South has come upon a singular deposit of rich ore. At the depth of 12 feet the shaft penetrated a cavity in the hard rock filled with a decomposed mass which is worth about $5 per pound. The opening is about four feet wide, so far as known, and runs off west northwest to an unknown distance..... First dividend of the Industry was $4 per share.....*Empire* says Capt. Holdridge has bought Rainbow No. 2 for $4,000 cash..... *Telegram* says the Chester mine has 20 tons of ore on the dump that will average $125.

WATER WORKS,—*Empire*, 9th: The 12-inch supply pipes are being laid at the rate of 1,000 ft. per day. The engines and pumps are in place and nearly ready to drive water through the summit tunnel. Two reservoirs are under contract.

BULLION HILL.—*Telegram*, July 3d: Bullion No. 10 has a shaft down 40 feet, and 70 tons of excellent milling ore on the dump.

THE SANTA CLARA is a very promising mine, situated in the Base Range. The principal owners are in San Francisco. The Company is incorporated. Their shaft is down 20 feet, and they have at least 25 tons of ore on their dump.

THE ELM is also a fine mine, and will in all probability ere long, prove to be one of the most valuable in the Base Range. The ore shows horn silver in larger quantities than the most sanguine anticipated. The company are busy running an open cut across the ledge, for the purpose of ascertaining its true wealth. The principal owners are here, and have any quantity of that which is most needful to develop a mine, muscle.

MOHAWK CANON—*News*: The Cassaday Ledge, a recent discovery, and location in Mohawk Cañon, is one of the most promising of the base metal mines. The vein is well defined, traceable 300 feet, and is from two to three feet in width. The ore, a beautiful specimen of which we have, contains some galena, but is rich in chloride, and assays from $95 to $238.77 in silver.

MURRAY LEDGE.—This is the name of a new discovery in Sawmill Cañon, western slope of White Pine Mountain, which carries the finest-looking quartz we have seen from the base metal region. The ledge is four feet wide, and the ore will doubtless yield handsomely by smelting.

MILLS.—*News*, 9th: Stanford's Mill machinery is arriving. Logan's Mill, at Swansea, will steam up on Monday. Says the *Empire* of the 11th: The Pocotillo Company is going to build a mill at the foot of the hill below the mine....Elko *Independent* of 10th says, the roads are strung with teams, loaded with machinery etc. for White Pine.

OUTSIDE DISTRICTS.—*News*, 6th: The Oro Fino holds its place on the Star ledge of Sacramento district.....The *Empire* of 11th says: Messrs. Yager and Goodwin from Reveille district, brought in 300 pounds of ore which assayed $2,950 per ton.....Some fine ledges have been struck in the mountains west of Duckwater, 35 miles south of Hamilton. Assays go as high as $900 per ton. Some excitement already.....*Telegram* of 6th says, everybody is busy in Patterson District. The little 2 stamp mill works up ore worth $200 per ton.....Over 100 men on their way to Mount Ophir District on July 2d, and 300 already there.

EBERHARDT.—"A reduction in wages from $5 to $4 has taken place in the Eberhardt mine, in consequence of which the miners struck, and work has stopped. At a meeting of the Miners' Union a committee was appointed to confer with the Superintendent of the Eberhardt. A special meeting of the Union will be held to take action on the report of the committee. It is understood that other leading mines will also reduce the wages."

New Mexico.

ARROYO HONDO.—Santa Fé *Gazette*, June 26th: The Mining and Ditch Co. have received the machinery for their 15-stamp quartz mill, and are putting it up.

ABIQUIU.—The gentlemen who visited Ahiquiu to look into the value of the mines, have returned. We understand they report good indications for gold, but that the water for washing it will have to be brought from the Chama—a distance of three or four miles.

It is understood that the Moreño ditch will be completed this week. The reports from these mines are flattering. More gold is offered for sale in Elizabethtown than there are greenbacks with which to purchase it.

A correspondent of the St. Louis *Democrat* writing from Elizabethtown, N. M., June 4th, says that L. B. Maxwell has sold his grant to some English speculators for $800,000, making some valuable reservations.

The Moreño *Lantern*, of Elizabethtown, says: The shipment of gold for three days this week amounts to $6,222.34....Calhoun & Co., in Grouse Gulch, cleaned up on Friday 21 ounces from four days' run..... Matthew Lynch sold his interest in Maxwell's mill and lode last week, for $50,000 cash, to Col. Bergmann and John Dold.... Pat. Connelly sold his interest in the Pacific lode last week, to a Mr. Hayden, from Cincinnati, for $5,000....Robert Floorman started up Bartholomew's 8-stamp mill in Humbug this morning, on ore from the North Star lode....Pollock's claim at the foot of Grouse Gulch gave 11 ounces and 18 pennyweights of gold, worth $262, the result of the labor of six men in one day and a half.

Oregon.

GOOD CLEAN UP.—Jacksonville *Sentinel*, July 3d: Messrs. Dillon & Bowden cleaned up last week, after crushing 70 tons of quartz. The result is not made public, but the proprietors are in good spirits, and say that they got more than a good working prospect. They will push work again vigorously.

Prof. John Veatch will make a geological survey of Bohemia District. The same gentleman, associated with J. Knott and Richard White, have agreed for an interest in the Excelsior lead, to make a thorough and scientific examination of that lead, and to report within a reasonable time.

San Francisco:
Saturday Morning, July 17, 1869.

Notices to Correspondents.

Juniper, Santa Cruz.—Arhoriculture possesses other rcommendations to those purporting to become permanent residents of California, than mere personal profit. In a dry climate, the want of an adequate amount of trees is apt to occasion irregularity of temperature; violent storms, and aridity, while on the other hand, land overclothed with wood may produce the opposite effects, viz., a comparatively stagnated character of the atmosphere accompanied with, to human constitutions, an nnhealthy amount of moisture.

C. W. B., Oakland.—The mortality of poultry which is known to prevail in so mysterions a manner, has not, so far as we are informed, been referred to any special cause. An acquaintance who has paid more than a ten years' attention to the subject, conceives that amongst chickens, the mortality is chiefly attribuable to apoplexy; hut with ducks and geese, to an inflammation of the bowels, though how occasioned, he never could satisfy himself other than that it prohably arose in consequence of molting. The subject in an economic and scientific view, possesses great interest, and we would like to hear from any correspondent disposed to throw light on the subject.

S. M. R.—According to the cosmogony of Pythagoras, the infant world was represented as placed on the back of an elephant, itself being supported on the back of a tortoise. This, and the transmigration of souls, formed parts of Hindoo mythology. It is supposed that the mythical tortoise alluded to has been based on the fact that the remains of an enormous tortoise, *Colossochelys Atlas* have been discovered in India, which possessed a shell twelve feet long, eight feet in diameter, and six feet high.

Piscator, Marin County.—It is quite probable that both the sole and turbot, two of the most valuable fishes, would flourish from the Bay of Monterey to Fuca Straits, if the ova were transported here and *planted* on appropriate banks. Calculations have been made as to the moneyed worth of certain fishing stations, by which it has been estimated that the value of the *trawling* ground in the German ocean is equal to 25 cents per acre, and that of the Bay of Galway (Ireland), is worth more per acre than the land which environs it.

Mechanical Movements.—We have recently made arrangements hy which we shall be enahled shortly to place on sale on this coast, a large and splendid edition of a hook of over 500 Mechanical Movements, which we will sell at Eastern prices, in order to place it withiu easy reach of every inventor on the Pacific Coast.

Only four States of Mexico are now in a state of revolution.

Postal Telegraphing.

The *Herald* is making a gallant strike in favor of postal telegraphing—more definitely in favor of the passage of the Hubbard bill before Congress at the next session. In this it appears that the *Herald* has the sympathies of the entire communnity, and not alone of the Democratic party which sustains that newspaper on the telegraph question. To the Associated Press this is purely and rather keenly a matter of hnsiness. Bnt that association would do unwisely to oppose any ohstacle, avowedly or otherwise, to a system of cheap telegraphing which shall be at the command of all; for intelligence should be in principle like sunshine, at the service of everybody, on the freest terms. What is more, postal telegraphing is a thing all but certain to come to pass. The wires being once stretched, there is little cost thereafter in transmitting even long messages, nnder the use of the improved iustruments whereby writing at one or both ends of the wire is reduced to a minimum of labor. The introduction of the money order system in the Post-office Department was a greater innovation a few years ago than postal telegraphing would be at the present time.

This is a question so eminently practical, so undeniably in the interest of the public, and in accordance with that peculiar American energy which brings new inventions unceremoniously into practical applicatiou, that the result can be but a matter of time. Newspaper enterprise will always find field enough outside of telegraph combinations, to enable it to hold its own against all upstart competition. It is only lack of enterprise and lack of brains on the part of established journalistic undertakings, that can have the least to fear from the inauguration of cheap postal telegraphing; for then the competition would be more on a hasis of absolute merit, and in such a case certainly in the interest of the reading and doing public.

The Associated Press aud the Reuter organizations of moderu times are amongst the most commendable of the fruits of invention and of advancing civilization; their services to the public have been and continue to beinvaluable, thongh they do stand towards unadmitted newspapers sometimes in the guise of a monopoly. Postal telegraphing wonld not do away with any "associated press monopoly;" but on the contrary, while affording to others the opportunity to compete, in the widest dissemination of intelligence, the Associated Press would maintain its individuality in its superiority of news, in the greater value and hetter quality of the matter collected for the general public.

On this principle it is that the general public can now afford to pay a hundred times more for news of every kind transmitted in its interest, inclnding stocks and financial reports, thau can even the most powerful moneyed and individual interests. We recognize it as a demand of the times,—a point to which we have attained in the history of newspapers and telegraphing,—that the transmission of news on which so much depeuds, shonld be ou the freest footing, and entirely untrammeled by dictates or interests of individuals and corporations. This great principle has ever been acted upon by the government—that the telegraph must he subservient to the uses of the governmeut. Who is to care for the interests of the quiet, the unorganized, long-suffering, and in all ages the much-abused and too often slavish public at large? The newspapers, in our day,—and a liberal Associated Press.

Hearth and Home, published by Pettingill, Bates' & Co., No. 37 Park Row, N. Y., contains some very excellent matter. No. 30 begins "Romance of a Rich Young Girl," by Octave Fnillet.

Fourth Annual Report of Yale Scientific School.

The Fourth Annual Report of the Sheffield Scientific School of Yale College has been received—hut unfortunately too late to enable us to incorporate its facts in onr remarks on that subject made in a recent issue. No changes have been made in any of the professorships for several years. We miss the names of A. P. Rockwell, professor on the suhject of Mining, and Charles J. Sheffield, instructor in Assaying; the same gronnd heing well covered, however, hy Professors Norton and Brush. Amongst the instructor's list of names, J. B. Stone, C. E., in Mathematics, is replaced by Daniel H. Wells, C. E.; Beverly S. Bnrton, Ph. B., on Chemistry, by William G. Mixter, Ph. B.; John Avery, M. A., on Physics, is missed; and new instructors have been appointed as follows: Sydney Smith, Ph. B., on Zoölogy; E. T. Nelson, B. A., on Mineralogy; and Henry S. Williams, Ph. B., on Paleontology; Wilhur O. Atwater, B. A., and E. H. Bristol, Ph. B., on Chemistry.

The number of students in 1868-9 was 137; the number of graduates in 1868 was 26. A valuahle list is given of all who have been members of Yale Scientific School since its beginning in 1846, a total of 693; also of all the graduates, numbering to 1868 inclusive, 155.

The following are those permaneutly identified with, aud residing on the Pacific Coast.

1855–8	Ahernethy, William,	Oregon City, Oregon.
1862–3	Blake, Theodore A., B.A. N. Y. Free Acad. (Civil and Min. Eng.)	San Francisco, Cal.
1849–52	Blake, William Phipps, PH. D. (Geologist.) Professor in the College of California; Geologist to the U. S. Pacific R. R. Ex. under Lieut. R. S. Williamson	Washington, D. C.
1848–50	Brewer, Wm. Henry, PH.B., M.A., Botanist to Geological Survey of California; Norton Prof. of Ag. in Yale Coll	New Haven, Conn.
1858–60	Cifuentes, Jose Filomeno, PH.D.	Copiapo, Chili.
1864–6	Clark, Frederick W..	San Francisco, Cal.
1868–9	Dwinelle, Charles H.	Oakland, Cal.
1857	Fisher, R. A., M.D., *al.* Prof. of Chem., Min. and Metall. in Univ. of Cala	San Francisco, Cal.
1861–4	Goodyear, Watson Andrews, PH.B. (Civil and Min. Eng.)	San Francisco, Cal.
1863–5	Hunt, Henry O. (Assayer.)	San Francisco, Cal.
1862–5	Massey, Albert P., PH.D.	San Francisco, Cal.
1859–62	Moore, Gideon E, PH.D. (Chem.) Assayer to the Gould & Curry Min. Co., Va	San Francisco.
1854–5	Ortiz, Pedro P.	Valparaiso, Chili.
1858–60	Rice, Julio Alberto	Parral, Mexico.
1863–6	Thomas, Frederick F., B.A. PH.D. (Assayer.)	Silver Peak, Nev.
1863–5	Throckmorton, S. R., B.A.	San Francisco, Cal.
1848–9	Webster, G. G. M.A. LL.B.	San Francisco, Cal.
1861–2	Wilcox, Edward P.	Waioli, Sandwich Isl.
1860–2	Wilcox, Geo. N.	Waioli, Sandwich Isl.

New Woolen Mills.—The San José Woolen Mannfacturing Company have ordered all their machinery for a six-set mill of the ageuts of the builders, Messrs. W. O. M. Berry & Co., of this city, and it is expected to be shipped at an early day. The machinery ordered is to be Davis & Furber's make, built at their celehrated works, near Lawrence, Mass., except the looms, which are to be Crompton's patent, built at Worcester, Mass. The company have just broke ground for the new mill, at San José, which is to be a three-story building, and intend to have it all ready to receive the machinery by the time it arrives here. They design manufacturing blankets, flannels, and plain and fancy cassimeres.

At Los Gatos (Santa Clara Couuty), a set of woolen machinery is being set up by Mr. W. S. McMurtrie, in connection with his sawmill, to be run by water-power. This a second-hand set of machinery, formerly run hy Mr. Rector, at Oakland. If the enterprise proves successful, it is prohable that new machinery will he added.

Notes on the Hawaiian Eruption of 1868.—The Boston Society of Natural History publishes a quarto pamphlet, pp. 24, by W. T. Brigham, A. M., with two illustrations describing the phenomena of the late eruption, and contributing additional information to our knowledge of the earth's interior through the doings of its greatest known exponent, Mauna Loa.

The Ætna Insurance Company, of Hartford, Conn., held its 50th annual meeting, July 1st, and was attended by James M. Goodwin, who was a director at the organization of the company, and has been ever since.

The "Engineering and Mining Journal."

This is now the title of onr New York cotemporary, which lately came to us as the *American Journal of Mining*. The improved appearance with the new finely-engraved head, is especially noteworthy, and there is at the same time a solid valne to a nnmber of the articles that we find in the first number. Such is that on the very long-spanned *beton* hridge of Coignêt, at St. Dennis in the environs of Paris, which is illustrated—*beton* being merely a fine concrete which has been fonnd snfficiently adhesive in a non-earthquake country to make a strong and durahle flying arch of 196 feet span. The Connecticnt Peat Works are also described; an establishment for cntting or grinding and molding peat into bricks, which, by an outlay of $10,000 is capable of producing 100 tons of peat fuel per day. H. B. Cornwall commences a review of processes that have been tried, and with success latterly, for the desilverization of lead hy means of ziuc.

Western & Co. now fill a field in the *Engineering and Mining Journal*, and in the *Manufacturer and Builder*, which, if creditahly represented by American periodical publications specially devoted to the subjects embraced, will not merely do honor to us ahroad, but will incalculably benefit ourselves in advancing the development of our bonndless resources. It is in the same fie'd that the Mining and Scientific Press has represented, and still serves as the exponent of, the Western progress of the energies and arts of the Gothic race, a phenomenon of historic conquest—of races, of territories, and we may say now of the unreclaimed world itself—more remarkable and more telling in its results for the future, than is the strangely sounding (to us) story of the inroads of the Goths themselves iuto Celtic Europe, at the beginning of the Christian era.

Such publications, and the manner in which they are sustained by contributions of respectable matter, of ideas and facts pointing to general welfare and progress, are the index of the intelligence and capacity of the bodies they represent. Where there is no exhibition of practical thought of a generally useful bearing in the scicnce and intelligence of the better educated or trained and competetent engineers and mechanics, overflowing into the pages of a weekly or monthly periodical in this enlightened day, the conclusion is tolerahly safe that the merit not only of the mass, but especially of the leaders practically and theoretically and qualified to he such, is suhordinate and insignificant in a summing up of the progress of the arts and professions represented.

The Avitor.—To set at rest auy doubts as to the complete snccess of Marriott's aerial steam carriage, the Avitor, a public exhihition will take place at the Mechanics' Pavilion on Stockton street, between Post and Geary, on Tnesday, Jnly 20th, at which time a large number of eminent engineers and capitalists of this city and State will he present to witness this novel invention, in action. On the following day the public will have a chance to witness an exhihition of the same character, at the same place. A committee of eminent engineers has been formed for the purpose of constructing a working Avitor of large size, and one capable of carrying a number of passengers, which will be ready for operation in the course of sixty days.

To Remove Rust.—The removal of rust from a tool or any other iron implement, will be greatly aided by first soaking it for a short time in kerosene oil. It is really wonderful to notice the ease with which rust may he removed after heing thus saturated.

Miss Anna E. Dickinson's lectures have proved the greatest success of any course ever given in San Francisco.

The New Breech Loader.

Considerable interest was manifested at the East, about a year ago, over the introduction of Parker's new breech-loading gun. Gen. Siegel expressed himself very much pleased with it, and ordered a thorough test of its advantages as compared with other breech-loaders in use. The result of this trial was a verdict in favor of the Parker, over all other breech-loaders. The chief advantages of this, over other similar weapons, arises from the fact that the load is placed in a metallic shell, which remains in the gun, uninjured, after the discharge, the same shell being used for scores of times. Common ammunition is also used, instead of expressly prepared or high priced, as is usually required by breech-loaders. The expense of the use of this piece is thereby very much lessened. The weapon and charge is so arranged that, as claimed, it may be loaded and discharged more rapidly than any other, and with perfect safety. A large number of loads may be carried in the pocket, knapsack or pouch. The cost of the gun is less than one-half that of others of the same class. As a sporting gun, it would appear impossible that it could be excelled. The first invoice of these guns received in San Francisco, arrived a few days since, consigned to Mr. Richard Tibbals, agent for the manufacturers. Guns from this invoice may be seen at the store of Messrs. Liddle & Kading, 538 Washington street, and at the laboratory of Mr. T. C. Jessup, over Tucker's jewelry store, on Montgomery street; at either of which places they may be examined by those curious or specially interested in such matters.

The Grass Valley Strike.—Outrageous Proceedings.

The Nevada papers give the particulars of a brutal assault upon two different parties of workmen who were returning home, a few nights since, from their work at the Empire mine. The outrages are charged, either directly or indirectly, to the Miners' Union of that place; and as having been perpetrated because the men were using Giant powder, which the deluded strikers think it is their especial mission to crush out of existence. The *Union*, in alluding to the outrage, says: "This knocking a man down in the dark is a "moral suasion" method of keeping the Empire mine idle. These facts, simply related, are comments sufficient on the state of affairs now existing at Grass Valley. The public have been told not to agitate while such quiet and smoothness exist here." The entire power of the State should be called upon, if necessary, to protect the proprietors of the Grass Valley mines in their undoubted right to employ whichever kind of powder they think best, so long as they can find men who are perfectly willing to use it. Any concession to the strikers on *that* point would be fatal, in the extreme, not only to the mining interests of Grass Valley, but throughout the entire Pacific Coast, as well.

SOLAR SPOTS, according to the observations of Schwabe, continued without intermission for more than thirty years, possess a *periodicity*, the length of the period being eleven years and forty days, measured by the extent of surface of the sun observed by these phenomena. Col. Sabine, to whom was deputed the discussion of the results of the British Colonial magnetic observations, arrived at the remarkable result that the dicennial maxima and minimo magnetic effects coincided with the dicennial period observed by Schwabe in the solar spots, from which it has been inferred that the sun exercises a magnetic influence upon the earth, coincident on the condition of the luminous solar envelope.

Still's Gate Latch.

Mr. John W. Still, of San Francisco, has devised and patented through Dewey & Co., the gate latch here represented, in favor of which many good points are advanced.

A, is the upright of the gate frame, to which the latch is attached. The two screws seen in the engraving constitute its fastening to the gate, holding in place a little vertical rod or pivot (visible upon close examination of the cut) on which the latch swings, regulated by the spring C. When the gate is closed, the notch B holds against the stationary post, preventing the gate from opening without first drawing the ring B sidewards, in such a manner as to compress the spring C; that motion causes the notch B to clear the post, and permits the gate then to open.

Approaching from the other side, the handle D would have to be drawn in the opposite direction. When pushed to, the gate will of itself spring the spiral, C, and bring the notch B to a catch.

The favorable points of Mr. Still's latch are given as follows:

1st. Durability; as he warrants them for ten years, in ordinary wear.

2d. In security; as no kind of stock can open them.

3d. Neatness and elegance of style.

4th. Ease of adjusting to the gate, as there is no mortising and only four screws required. Little time for adjusting the latch is required by the carpenter.

5th. Cheapness.

6th. Convenience; as the gate can readily be opened from either side.

7th. There is comparatively no resistance to the gate closing, in which case the rigid Latch A, supported by the spring B, glides across the inclined plate C, and hooks over the end of it securely.

Testimony as to the working of these latches will be found in our advertising columns. Most of them are manufactured with a flat spring, instead of the spiral spring shown in the engraving, the former answering equally well and is cheaper. This latch is quickly attached to the gate and needs no machinery; the flat spring requiring but a slight cutting away on the frame of the gate.

THE WORKSHOP, published by E. Steiger, No. 22 Frankfort street, New York, is a credit to American periodical literature; No. 6 of Vol. II being received, and beautifully printed and filled as usual with very costly artistic engravings of industrial art; supplying designs and ideas for growing wealth and increased luxury in this country.

A WHITE PINE correspondent mentions favorably the "Black Rock," the "Jennie A," the "Ochotura," the "Home Pile Tunnel Co.," the "Treasure Hill Junction," the "Independence No. 1," and some other mines, which communication has been postponed too long for publication now.

PULMAN, the celebrated palace, eating and sleeping car man, is now building a grand church-car to run on Sunday trains on the Union Pacific Railroad.

Polytechnic Branch of the Mechanics' Institute.

The Ramie and Kindred Textiles.

A large and very intelligent audience attended the first of the polytechnic meetings of the Mechanics' Institute, which was held in the Reading Room, on Saturday evening last, when the Ramié and kindred textiles were under consideration. Being a special meeting of the members of the Institute, the action of the Board of Directors in electing W. W. Hanscomb to fill a vacancy caused by the resignation of George Hickox, was duly ratified. W. B. Ewer, from the committee on the Polytechnic Branch, reported progress and stated that there would be a fuller report made at the next meeting.

Dr. Joseph Silver's paper on the Ramié plant, as adapted to California, was then read. The exhibition of specimens, and various articles of manufacture from it, with explanations, questions and remarks bearing thereupon, occupied about half of the evening. The Ramié is the China or sea grass, of which summer coats were sold and worn by us fifty years ago—called *Ortie de la Chine* by the French, and botanically specified under the varieties of *Urtica Nivea*, *Urtica candicans*, and *Behmeria tenacissima*, the latter being the kind which is supplanting cotton in Louisiana and Texas. Dr. Silver stated that Henry Hughes, an English importer, in San Francisco, has received from a large manufacturer of Bradford, Yorkshire, specimens of new and peculiarly attractive goods, made by interweaving Ramié, instead of silk, with wool—Ramié forming the chain. The same post brought instructions to order from China one hundred tons of sea grass, or Ramié, to be shipped to England; and to follow it up by regular invoices thereafter. Mr. Hughes was requested to order at the same time a large quantity of the seed for California. The letter requests that every effort be made to induce our farmers to cultivate this most valuable plant, because it is about to be a leading staple for goods of many new varieties. Mr. Hughes has ordered an ample supply of seed for wide distribution in this State, and he will buy or make advances on all the Ramié fiber that he can get. The planting and plowing are like corn, the soil is best sandy; the harvesting is done with the machete, like hemp.

The planter does up the fiber in hanks for market. It is then raw fiber, worth ten cents a pound in gold. Preparing it for the factory is a separate industry. It has to be worked over, made fine and bleached, when it loses one-half of its weight. It is then worth sixty cents per pound, and it commands an active market at all times.

In soil, not over twelve feet from permanent water, it will probably stand three cuttings without irrigation in ordinary years. Deep-plowed ground in the foot-hills, well saturated by winter and spring irrigation, natural and artificial, may stand two heavy cuttings without summer watering. Low-lands make coarest fiber but largest crops.

Manufacturers say that it will, by rather rapid advances, effect great and radical changes in the styles of woolen and worsted combinations, known as stuff goods, where its great strength makes it a substitute for silk, and that it will be very largely interwoven with silk itself, as in Japan and India, forming very desirable dress goods. It offers to our agriculturists, in seasons of ordinary rains, a sure source of permanent profit, relieving them from the uncertainties of dependence upon exclusive grain production. Finally, our success in woolen goods leaves no reason to doubt our ability to manufacture cloth from Ramié, not only by itself, but in the various combinations of which it is susceptible.

The samples of raw fiber exhibited were about six feet in length, of a color resembling hemp. A sample of raw fiber, freed from the gummy substance, and ready for marketing, was slightly lighter in color, and done up in skeins or bolts. It is this quality which is worth ten cents per pound, which price is paid in New Orleans by exporters, and which will be commanded here as soon as sufficient quantities are produced.

In the preparation of the fiber the stalk is first soaked in water for a few hours, then passed through a brake similar to a hay-brake, to divest it of the woody portion of the stalk. It is then soaked in water again, and is again passed through the brake, freeing it partially from gum. The third soaking in water takes nearly all the gum out, when it is passed through a brake again. It is then ready for bleaching in the ordinary way, with chlorine.

The time for planting is at the commencement of the rainy season,—November.

A gentleman present exhibited a sample of fiber from a species of milk-weed, which grows wild in large quantities in the San Joaquin Valley, whence it was brought by Frank Howard. It was pronounced by Dr. Silver and other judges present to be highly valuable as a textile. The doctor stated that on the Humboldt River at the crossing of the railroad, there were thousands of acres of wild hemp, which were, in his opinion, fully as valuable as the Ramié. He sent a large quantity of it to Mr. Tubbs, of the San Francisco Cordage Factory, who pronounced it superior, and offered to pay $80 per ton for all that could be furnished. The doctor, however, thought it best to encourage the cultivation of the Ramié, for the reason that it was already seated in commerce.

Dr. Silver has made arrangements so as to be able to supply all who wish, with cuttings and roots, which he is obtaining at New Orleans. They will cost here in coin about what they cost there in currency. Once planted, the Ramié is perennial.

The President stated that the next paper will be read at the next regular monthly meeting, on the first Tuesday of next month, and will be on the subject of "Explosives."

Humboldt Mines.

Mr. A. J. Knapp has shown for several days at the office of the California Mutual Life Insurance Co., a bar of 96 ounces of silver worked at Reno, from 2,800 pounds of ore out of the above named mine. The mine is a new one, located five miles from Oreana. A tunnel has been run about 50 feet along the ledge, and the rock worked came from the face of the tunnel from one to eighteen feet from the surface. The proprietors are sanguine of soon developing a permanently paying mine.. The Piute is a copper mine, near Oreana, Nev.

The ore is chiefly fahl-ore and azurite. A specimen presented to us contains $49 silver, and 25 per cent. copper. Half a ton of similar ore is at present at W. A. Holcomb & Co's warehouse, San Francisco.

AMERICAN INVENTORS AND ENGLISH PATENT AGENTS.—In another column will be found an extract from the London *Engineer* in regard to the multitude of ignorant and irresponsible patent agents with which London swarms at the present time. The *American Artisan* quotes the language of the aforesaid journal, and makes the following pertinent remarks: "It behooves American inventors who desire to secure English patents to be on their guard against London patent agents, only known to them by advertising circulars, who are likely to entrap the unwary by their pretence of possessing peculiar advantages, and offer to do the business on very low terms, but afterwards surprise their clients by additional charges. Every person desiring to take a patent in England should—if he employs an English agent directly—be fully satisfied of his qualifications and character; but he will find it safer to do his business through an American agent of good standing, who, for the sake of his own reputation, will take care to employ only a properly qualified and reliable agent in England."

We need scarcely add,—"We Concur." [EDS. PRESS.

THE COPPER MARKET.—Copper, on the 1st instant, had declined somewhat in the New York market, under the influence of forced sales. Lake Superior was quoted at 21½c.; Baltimore, 22c., with moderate demand. There was no disposition to buy even at these prices, on speculation.

Professional Cards.

Notice To Mining Companies.

The undersigned offers his services to the mining public. Having devoted several years to the study of mining and metallurgy in some of the best schools and works of Europe and being acquainted with the metallurgical treatment of ores as practiced on this coast, he is confident of his ability to render valuable aid to parties employing him.

To Quartz Mining Companies.

To be sold positively within the next three months—the MINES, ENGINE, MILL, and entire Machinery of the TEMPLAR NO. 2 Quartz Mining Company, located at Indiana Ranch, Yuba County, consisting of—

One Steam Engine, 60 horse power, made by Burden, Brooklyn, New York.
Two large Boilers, in complete order.
One Eight-stamp Battery.
One Chile Mill.
One Cornish Lift-Pump, 6 inches, of superior make and finish.
280 feet of 5 inch Iron Suction Pipe.
One large Water Tank.
And also all of the necessary machinery, with Belting, Feed Pumps, Hose, Turn Tables, Cars, Ropes, Track Iron, Pinions, Plates, with Blacksmith Shop and all Tools and requisite implements to be found in a large and first class quartz mill.

The Company having ceased operations intend selling off their effects as speedily as possible.

For Particulars as to price, etc., address, by letter or otherwise, L. W. CAMPER, at Indiana Ranch; GEORGE B. HORNISH, Marysville; or E. W. HASKELL, Pacific Fruit Market, San Francisco. 24v18-1m

It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

Items of Patent Law.

The head of the American Patent Office, Mr. Fisher, has recently reversed a decision on appeal from the Board of Examiners in Chief on the strength of the point that in examining applications of patents there should be considered the question of utility rather with regard to the purpose of the invention than to the means of accomplishing it. The purpose proposed, if accomplished, must be usefnl, and the plan must not show the absence of some part obviously essential to the end.

A suit has been brought against the Government itself for infringing on gun patents, at Springfield. In devising the model of the new army gun, the Government has taken what were believed to be the simplest and best features of breech-loading guns wherever it could find them, without stopping to consider whether they were patented or not, being determined to secure the most perfect scheme attainable for making breech-loaders.

In this manner it appears quite a number of patents have been infringed upon. Col. A. B. Ely of Boston, claims the Preston patent breech-lock. An injunction is pending.

On the rejection of an application for a patent, Mr. Fisher has decided that if the application be not renewed within two years after withdrawal its continuity is broken. Before the repealing act of 1861 there existed a provision of law whereby rejected applicants were permitted to withdraw their applications and receive back two-thirds of the fee. Numerous applications of this kind have been reversed, and patents touching these same inventions and points therein, have since been granted.

In the English Patent Office, recently, an intending patentee had lodged a provisional specification, whon another inventor filed one of a similar description, and procured his patent to be the first sealed. The former complained of this, and argued that under the circumstances the Attorney-General should not have allowed the second person to file his patent. The Lord Chancellor, however, pointed out that there was no law to compel a person who had filed a provisional specification to proceed with his invention, and if the applications of other parties were to be uniformly rejected, the country might be deprived of the fruits of the ingenuity of many minds which were working in the same direction.

THREE-FOURTHS OF THE "GIRDLE" ALMOST COMPLETED.—Opportunely with the grand opening of the Pacific Railway, comes news of the progress made by the East India Telegraph Co. coupling Canton with Calcutta, Loudon and New York. By the end of the year, as the sangnine American conductors of the enterprise give to be understood, the line will be completed. San Francisco will then send her news for China east, and her ships west; will transmit orders for teas and silks three-fourths of the way around the globe in a moment, and will receive the shipments from an opposite direction, in little over a fortnight.—*N. Y. Tribune.*

Blake's Patent. THE BEST PUMP for Boiler Feeders, Breweries, Sugar Houses, Tanneries, Mining and Fire purposes, etc., is Blake's

Patent Steam **PUMP**
It is simple, compact and powerful, needs no expert to run it, and will start at any point. Is warranted positive under all circumstances. Send for a circular. W. O. M. BERRY & CO., 114 California St., San Francisco, Cal.

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.
Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

CARLOS O'DONNELL'S
California Cordial Tonic,
—OR—
Wild Cherry Bitters.
TRADE C. O. D. MARK.
This elegant preparation is acknowledged by all who have used it to be the most efficient remedy for every disease of the
STOMACH AND BOWELS,
Yet introduced to the notice of the public. Immediately on taking a dose of it, the patient will find a genial glow pervading his entire system, and its steady use for a short time will be followed by a healthy appetite and a good digestion, even in the case of the most confirmed dyspeptic.
To all who are suffering from
INDIGESTION,
DYSPEPSIA,
DYSENTERY,
DIARRHŒA,
NERVOUS AFFECTIONS,
Or any of the manifold troubles caused by a diseased action of the stomach, this remedy is confidently recommended as a safe and certain cure.

Ayer's Cathartic Pills,
For all the purposes of a Laxative Medicine.

Perhaps no one medicine is so universally required by everybody as a cathartic, nor was ever any before so universally adopted into use, in every country and among all classes, as this mild but efficient purgative *Pill*. The obvious reason is, that it is a more reliable and far more effectual remedy than any other. Those who have tried it, know that it cured them; those who have not, know that it cures their neighbors and friends, and all know that what it does once it does always—that it never fails through any fault or neglect of its compositions. We have thousands upon thousands of certificates of their remarkable cures of the following complaints, but such cures are known in every neighborhood, and we need not publish them. Adapted to all ages and conditions in all climates; containing neither calomel or any deleterious drug, they may be taken with safety by anybody. Their sugar coating preserves them ever fresh and makes them pleasant to take, while being purely vegetable no harm can arise from their use in any quantity.
They operate by their powerful influence on the internal viscera to purify the blood and stimulate it into healthy action—remove the obstructions of the stomach, bowels, liver, and other organs of the body, restoring their irregular action to health, and by correcting, wherever they exist, such derangements as are the first origin of disease.
Minute directions are given in the wrapper on the box, for the following complaints, which these *Pills* rapidly cure:—
For **Dyspepsia** or **Indigestion, Listlessness, Languor** and **Loss of Appetite,** they should be taken moderately to stimulate the stomach and restore its healthy tone and action.
For **Liver Complaint** and its various symptoms, **Bilious Headache, Sick Headache, Jaundice** or **Green Sickness, Bilious Colic** and **Bilious Fevers,** they should be judiciously taken for each case, to correct the diseased action or remove the obstructions which cause it.
For **Dysentery** or **Diarrhœa,** but one mild dose is generally required.
For **Rheumatism, Gout, Gravel, Palpitation of the Heart, Pain in the Side, Back** and **Loins,** they should be continuously taken, as required, to change the diseased action of the system. With such change those complaints disappear.
For **Dropsy** and **Dropsical Swellings** they should be taken in large and frequent doses to produce the effect of a drastic purge.
For **Suppression** a large dose should be taken as it produces the desired effect by sympathy.
As a *Dinner Pill,* take one or two *Pills* to promote digestion and relieve the stomach.
An occasional dose stimulates the stomach and bowels into healthy action, restores the appetite, and invigorates the system. Hence it is often advantageous where no serious derangement exists. One who feels tolerably well, often finds that a dose of these *Pills* makes him feel decidedly better, from their cleansing and renovating effect on the digestive apparatus.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

New Almaden Vichy Water,
(CALIFORNIA VICHY WATER.)
FROM THE SPRINGS,
NEW ALMADEN,
Santa Clara County.
F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.
OFFICE, 506 JACKSON STREET,
GENERAL DEPOT:
Corner of Jackson and Montgomery streets.
This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the veinous circulation.
It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.
California Vichy Water is used with success in many cases, such as—
Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Corpulency and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.
(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.
PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece
Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

Mining Property for Sale.
A Two Thirds Interest
OF THE
Golden Rule Mining Company's Claims and Mill,
Situated in Tuolumne County, California, two and a half miles south of Jamestown, on the Great Mother Quartz Lode. A good 15-stamp Water Power Quartz Mill is situated on the property, with a never-failing supply of water, as can be shown by the last four years continual running. This Claim has three parallel Ledges, from 50 to 100 feet apart, averaging from two to six feet in width, with a length of six hundred feet. They are so situated that a tunnel has been run through them at right angles, making a surface drainage of from seventy to eighty feet in depth on the mine. The mine is well ventilated by shafts from the surface, and well timbered so far as worked. In the mine are steam Hoisting Works, capable of hoisting from a depth of 300 feet. A force of thirteen men only are required to keep both mill and mine running regularly.
On the surface and flats for a distance of 500 feet from these veins, the ground or surface was mined by placer miners, in former years, producing from two to five ounces per day to the man, during the season when water could be obtained, which fact goes to prove that a heavy deposit of ore was once contained in the croppings of these shutes, which, by all former and present theories of deep mine workings, came from below, indicating that when such upper ore is proper depth, the lead will develop a mine equal to the Amador or Eureka.
This claim has paid its 19th regular dividend of $1,500 each, during the past four years, besides all the construction and other expense account, and has levied no assessments during the same time, and at present has on hand $8,000 in the Treasury, and no debts.
The last level, 150 feet from the surface rock, averaged $7 per ton, on which was a profit of from $1 to $1 50 per ton. The length of the two shutes of ore on the east vein, and the only one worked upon, has been about 200 feet.
Now I propose to sell two thirds of this valuable property for $16,000, cash; and any party who desires to purchase a property of this kind—which theory has proven that it requires depth, on well known shutes of ore, for a sure fortune—can obtain a chance here, providing he or they will go down a sufficient depth. No purchaser is solicited unless he first goes and examine the mine, or sends a miner engineer in whom he can have confidence, to indorse what he may think proper of what has been here stated.
For any further particulars, direct by letter to Wm Bosworth, San Francisco, P. O. Box 1978, or at my office, room No. 5, over Honohoe & Kelly's Bank.
22v18tf qr WM. BOSWORTH.

A Long Desired Article
FOR CLEANING THE HEAD AND HAIR. THE CLEANing of the head and hair has been the subject of consideration for a long time. This object will be accomplished by using
CAMILLE CHAMPOO,
which not only does away with the poor soap so offensive to use, and so injurious to the hair, but it cleans the head, strengthens and beautifies the hair, preserves the color, and prevents baldness. It is cooling in nature, and can be used with safety and reliance on the smallest infant. Price 50 cents per bottle. Prepared by EMERTON & LUELLING, 723 Mission street, San Francisco, Cal.
HEATHFIELD & BOCLE, Wholesale Druggists, 206 and 208 Battery street, San Francisco, sole Agents for the Pacific Coast. 21v18-3m

Familiar Science.

Food, and How to Eat It.

Cabbage, parsnips, beets, cucumbers and onions, are very indigestible, and should never be eaten by persons who are troubled with a weak stomach.

Tomatoes, apples and similar kinds of fruit should also be eaten by such persons with caution, although they are very easily digested. Such food, when eaten by dyspeptics, is apt to produce intense acidity of the stomach,—followed by sick headache, heartburn, etc.; milk will often produce the same effect. Potatoes, beans and green peas are excellent food, provided they are boiled very soft; but even they must be eaten sparingly.

The reason of all this is found in the unhealthy condition, and consequent slowness of action of the digestive organs, which, with dyspeptics, (those troubled with sour stomachs) is so slow that such food runs into acidity before digestion is effected; then, of course, comes sour stomach, pain in the bowels, sick headache, etc. In the case of beans and peas the mischief is mainly attributable to the indigestible skin with which they are covered. A bean swallowed whole will no more digest than will a cherry stone or a ballast stone.

Good fermented bread, and a tender juicy steak, if well masticated, will seldom turn to acidity. When the stomach is very weak, dispense with the meat, and toast the bread. Flour, somewhat coarsely bolted, is better than very fine flour; it does not turn to acidity so soon, and lays easier, in every way, upon the stomach. *Very coarse* Graham flour and *bran*, however, should be avoided; such food irritates the tender coating of the stomach and bowels, thereby causing a watery effusion and purgation—it operates very much like castor oil, only it irritates more, and in that respect is worse.

Mastication is one of the greatest causes of indigestion. No food should enter the stomach until it has been reduced to a fine, soft pulp, free from lumps, by the action of the teeth and saliva. A close observance of this rule, and a bread diet, to begin with, will in time cure almost any dyspeptic.

Don't Run Up Stairs.

Don't run up stairs; there is no need of it—unless the house is on fire, or some other dread calamity impending. Ladies don't run in the street, nor in the hall; why then should they *run* up stairs, and then complain because it is such hard work, or because the stairs are so high? There is as much philosophy in getting up stairs, as there is in hoisting a bale of goods into an upper story. It is no more difficult to go up stairs than it is to do any other kind of work, if you only take the proper time for it. In going up stairs you have not only the forward motion of walking to accomplish; but you have also to hoist some 130 or 170 pounds to the hight of the flight. This latter is work, and you must take time for it, just as the man does when he hoists an equal weight of merchandise to the upper floor. See how slow it rises; it is no harder work to do that, than it is to perform any other labor, if he takes his time for it—and the *workman* generally does that.

There is really but little more difficulty in ascending a flight of stairs, than there is in walking three times the distance in a straight line, if we only take about the same time to ascend, that we should in walking three times the distance of ascent. Walk up stairs slowly; rest at each landing, (and there should always be a landing, at least as often as every ten feet of elevation) and you will reach the top without exhaustion or fatigue.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

FOR THE WEEK ENDING JUNE 29th.

MACHINE FOR KYANIZING WOOD.—David W. Hunt, San Francisco, Cal.—91,848, antedated June 22d, 1869.

This invention is designed to provide an improved machine for retaining the wood in position, while the substances or solution for kyanizing are forced into its pores. It is in fact a cheap device for forcing the solution into the pores of the wood. Instead of placing a stick of timber in a boiler or expeusive cylinder, Mr. Hunt simply places a plate upon one end of a stick of timber, so constructed, by having its edges turned up, as to make a water-tight joint by being pressed against the end of the timber, and at the same time leave a small chamber between the face of the plate and the end of the stick. Into this chamber is forced, by hydraulic pressure, the preserving fluid, be it oil, liquid sulphates, creosote, or any other kinds of liquid. The pressure forces the liquid into and along the pores of the wood, driving the sap before it as far as may be desired—through the entire stick and out at the top, or only for a short distance, as for the bottom of fence posts, or the ends of timber designed to be placed in brick walls, where, without some such preserving process they soon decay, by means of the moisture abstracted from the bricks.

A large number of these machines may be constructed at small cost, and by meaus of a small force pump may be operated in the field or shop, or wherever else it may be convenient to affect the preservation process. The plate is held in place by connecting rods passing through a similar plate fixed upon the opposite end of the timber. Mr. Hunt is an old and ingenious inventor, and one who has given much time to kyanizing presses, to wood pavements, etc.

PROCESS OF ROASTING AURIFEROUS SULPHURETS.—Wm. Bruckner, Central City, Colorado Territory.—92,009.

This invention relates to the application of certain materials, in a particular manner, so as to more readily and effectively accomplish the roasting of gold-bearing sulphurets. Mr. B. is inventor of the well-known Bruckner's revolving furnace, exhibited at the Mechanics' Pavilion in this city in 1866. He is now operating successfully with his invention in Colorado.

SUBMARINE FOUNDATION.—Wm. H. Foye, San Francisco, Cal.—92,033.

The object of this invention is to provide mechanical means by which the construction of the foundation of submarine walls is greatly facilitated. It also relates to the foundation of the walls for buildings and other structures erected upon ground and in countries subject to earthquakes. In the construction, granite, concrete, or any other suitable substance is employed—concrete being generally preferred, especially for submarine works. As this invention is one of much practical value and interest, we propose, at an early day to illustrate and fully describe it.

STEAM ENGINE GOVERNOR.—William H. Howlaud, San Francisco, Cal.—92,051.

This invention consists of two or more light curved springs, pivoted at one end to a loosely moving collar, by which the valve stem is operated, and which are fastened at the other end to the spindle or disk from which they receive their rotary motion. The weights consist of short cylinders, with conical ends, placed within the springs, and having their cones formed at such an angle that when in place they bear against and support each other. The weights are kept in place by grooves, in which the springs rest, so that they are thrown out or drawn in by the varying speed.

STEAM ENGINE VALVE.—William H. Howland, Sau Francisco, Cal.—92,052.

This invention cousists of an instrument which may be used as a gauge-cock for steam boilers, or au oil cup which may introduce a certain quantity of the lubricant, as may be desired. It may also be employed as a faucet for beer or other liquids; a throttle-valve for steam pipes, and for all purposes where an ordinary stop-cock is employed; but with the advantage of always remaining tight, without being tapered, while it is not liable to become fastened in its seat. It also possesses the still further advantage of costing much less in its construction than any other cock.

Both this and the governor noticed above, and also invented by Mr. Howland, have been already referred to in our columns.

FOR THE WEEK ENDING JULY 6TH.

FUNNEL.—Henry F. Lawrence, Vallejo, California.

IMPROVED RAILWAY.—Sutton and Crowell, San Francisco.

MANUFACTURE OF SUGAR. — Claus Spreckels, San Francisco. Re-issue.

MACHINE FOR WASHING DISHES, KNIVES AND FORKS, ETC.—Charles M. Leland, Central City, Colorado Territory.—92,323.

California Academy of Sciences.

An adjourned meeting of the California Academy of Natural Sciences was held on Tuesday evening, Dr. J. G. Cooper in the Chair.

Messrs. A. T. Winn and Isaac Wormser, Consul of Wurtemberg, were elected resident members.

Dr. Behr stated that in a recent invoice of prepared insects which he had received from Acapulco, was a species of Northern butterfly. The specimen was caught in a mine, back of Acapulco, at an elevation of 2,000 feet above the sea; and he thought it would be a matter of interest to know how far the Northern species of butterfly went into the tropics.

Prof. Bolander gave an interesting account of a trip which he had taken among the Sierras, and a description of Emigrant Gap and Bear Valley, in Nevada county, and the country surrounding. His theory is that that beautiful valley was once a lake; large worn boulders and pebbles gave ample evidence of this. The appearance of the mountains showed the effects of glaciers, and he had no doubt that the cañon was produced by one of these immense fields of ice.

Mr. H. P. Carlton, who accompanied Prof Bolander, stated that he had made a collection of shells from the mountains in the neighborhood of Cisco.

A large collection of plants from Oregon were then exhibited. They had been prepared with great care, and were exceedingly beautiful.

Dr. Henry Gibbons, Senior, then presented a communication from J. M. Upham, of Rio Vista, which was read. Mr. Upham stated that the remains of several Indians had been exhumed near that place. One, the body of a woman, was found buried in a sitting posture, while the men were lying on their sides, in a cramped up position. the skull of the woman had been secured by a gentleman and brought to this city. All of the bones were gathered up by the Chinamen working at the place where they were found and burned. Mr. Upham then spoke of the reclamation of Sherman Island. Forty-seven miles of levee, five feet in hight, had been built around the island, at a cost of $80,000. He thought if a committee from the Academy would visit that locality they would be able to collect much valuable information.

The members then entered into a very interesting discussion in regard to the tule lands of California, and the reclamation of them for agricultural purposes.

Cholera—How to Cure It.—At the commencement of the diarrhœa, which always precedes an attack of the cholera, take a teaspoonful of the Pain Killer in sugar and water (hot if convenient), and then bathe freely the stomach and bowels with the Pain Killer clear. Should the diarrhœa or cramps continue, repeat the dose every fifteen or twenty minutes till the patient is relieved. In extreme cases two or more teaspoonfuls may be given at a dose. The Pain Killer, as an internal remedy, has no equal. In cases of Summer Complaint, Dyspepsia, Dysentery, Asthma, it cures in one night by taking it internally, and bathing with it freely. Its action is like magic when externally applied to Bad Sores, Burns, Scalds, and Sprains. For Toothache, don't fail to try it. In short it is a *Pain Killer.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

REDINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents. jy1m

ADDRESS WANTED.—We are desirous of communicating with Allen Oliver, lately of Jamestown, Tuolumne County, California. tf

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. HOWLAND.

The Golden Gate Latch.

Invented by John W. Still, of San Francisco, Patent obtained February 2d, 1869, through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, is rapidly becoming the leading Latch of America, on account of its real worth, as attested by all who have used it. The inventor of this splendid improvement justly claims superiority over all others now in use.

1st. Durability, as he warrants them for ten years in ordinary wear.
2d. In security, as no kind of stock can open them.
3d. Neatness and elegance of style.
4th. Ease of adjusting to the gate, as there is no mortising and only four screws required. Not one-half the time of adjusting the ordinary latch is required, and of course better for the carpenter.
5th. Cheapness.
6th. Convenience, as the gate can readily be opened from either side.
7th. There is comparatively no resistance to the gate closing, in which case the rigid Latch A, supported by the spring B, glides across the inclined plate C, and books over the end of it securely.

And we extract a portion of one of the many letters of commendation the inventor has received, as follows: "I have for some time been using your 'Golden' Gate Latch, both on my barn, doors and gates, and for security, durability and convenience, I have met with nothing to compare with it. You have properly named it as well on account of its golden virtue as to designate from whence it enumerates; and I can assure you I am proud to know that California has the honor of working out the vexed gate-latch problem."

Mr. Still having made arrangements to have this magnificent Latch manufactured East in the most durable and elegant style, and in quantities sufficient to supply the United States, will furnish them on the most liberal terms. All communications in reference to it addressed to him through the San Francisco Post Office will be promptly attended to.

N. W. SPAULDING,
Saw Smithing and Repairing
ESTABLISHMENT.

Nos. 17 and 19 Fremont St., near Market,
MANUFACTURER OF
SPAULDING'S
Patent Tooth Circular Saws.
They have proved themselves to be the most durable and economical Saws in the World.
EACH SAW IS WARRANTED IN EVERY RESPECT.
Particular attention paid to construction of
Portable & Stationary Saw Mills.
MILLS FURNISHED AT SHORT NOTICE,
At the lowest Market Prices.

Pacific Mail Steamship Co's
STEAMSHIPS FOR
NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **10th, 17th** and **30th** of each month that has **30** days.

On the **10th, 18th** and **30th** of each month that has **31** days.

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 17th falls on Sunday, they will leave on the Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departure of the 17th or 18th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

The following Steamships will be dispatched on dates as given below:

July 9—GOLDEN CITY.....Capt. Wm. F. Lapidge,
Connecting with ALASKA, Capt. Gray.
July 17—MONTANA.....Capt E. S. Farnsworth,
Connecting with HENRY CHAUNCEY, Capt. Connor.
July 30—COLORADO.....Capt. Wm. H. Parker,
Connecting with ARIZONA, Capt. Maury.

Passengers berthed through. Baggage checked through. One hundred pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets to Liverpool by the "Inman" and "National" Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship GREAT REPUBLIC, Capt. Cavarly, will be dispatched for YOKOHAMA and HONGKONG on SATURDAY, July 3d, 1869, at noon connecting at YOKOHAMA with the steamer NEW YORK for SHANGHAI. Shippers of freight to China or Japan are requested to mark on each package its destination.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

RAILROAD PROGRESS.

THE stringency of the money market has as yet failed to exert any unfavorable influence on railroad work, anywhere throughout the Pacific slope. Work upon unfinished roads and portions of roads, appears to be pushed ahead with as much energy as ever. We report progress on the various roads since our last reference, as follows:

THE WESTERN PACIFIC.—One hundred and fifty men are at work upon the bridge over the Mokelumne river, which will be completed by the first of August, when the cars will commence their regular trips to Stockton. Quite a large number of men who have been at work around Stockton, have been transferred, the past week, to the Oakland end of the road, where there are now between two and three thousand Chinamen at work.

THE OAKLAND STREET RAILROAD.—The grading upon this road is being rapidly pushed forward. The timber and iron is already on the ground, and track laying will soon be commenced. This project is not expected to be a profitable enterprise at first; but it will greatly enhance the value of real estate along its line, and will eventually become a dividend-paying investment.

THE CALIFORNIA PACIFIC track-layers have about or quite reached Knight's Landing, where a mile of tule land will delay them a while for piling. The road will reach Marysville by the middle of October.

MARYSVILLE TO GRASS VALLEY.—A road between these two points is much talked of. The topography of the country through which it would pass is very favorable. The cost of such a road would be quite small—not more, it is thought, than would be the cost of the much shorter route from Grass Valley to Colfax.

PETALUMA TO CLOVERDALE.—Since the impression has gone abroad that the projected Sausalito and Humboldt road will not be built, a strong independent movement has been made for connecting Cloverdale by rail with Petaluma, and articles of incorporation have been filed with a capital of $1,400,000 for such a work. This road, if built, may at any future time be used as one of the links for the Humboldt road, which *must*, sooner or later, be constructed. We are still quite confident in the belief that the Vallejo project will be carried through, and at a very early day.

THE SAN QUENTIN AND SAN RAFAEL RAILROAD Co. have advertised for, if not already received, bids for the construction of a road between those two points.

RAILROAD AND BOAT TO SAN JOSE.—A company has been formed, which appears to mean business, for the construction of a railroad from San José *via* Santa Clara to Alviso, from which latter place a line of fast steamers will run to San Francisco. A horse railroad between Santa Clara and San José is now nearly ready to go into operation, which may possibly form a portion of the line first alluded to. This road, if built, will owe its existence mainly to the exorbitant freight charges of the San José road—bad policy on the part of the latter company.

OAKLAND AND SAN JOSE.—It is said that work will be commenced for the extension of the Alameda railroad to Warm Springs and San Jose, as soon as the Western Pacific is completed to Oakland. So it appears that San José promises soon to be pretty well "connected" with San Francisco—by the San José road on the west side of the bay; the Alameda road on the east side, and the Alviso road and steamboat line *through* the bay.

LOS ANGELES AND SAN PEDRO.—The cars are running out ten miles from San Pedro, on this road. The work is being pushed rapidly towards its completion; 200 men, and more teams have lately been added to the working force. The iron horse will soon be steaming into the city of Angels.

MARYSVILLE TO OREGON.—Work on this road is still being rapidly pushed forward. We hear nothing definite with regard to the project of purchasing the Oroville road.

THE VIRGINIA AND TRUCKEE ROAD, it is now confidently anticipated, will be completed by the 1st of December, perhaps two or three weeks sooner. The monthly pay roll now amounts to about $120,000. The road-bed is nearly ready for the track. The tunnels will all be completed in about six weeks. The completion of this road will be a great thing for Virginia City, and all concerned in the Comstock mines.

WHITE PINE.—Arrangements are being made for the construction of an incline tramway between Hamilton City and the Pogonip Heights of Treasure Hill. The distance is only about 1,000 feet; but a great saving of time and expense in the transportation of ores, etc., will accrue from this improvement. The down cars will draw up the empty ones by a rope passing over a large pulley at the top. Mr. Richardson, the projector, expects to drive the "last spike" inside of a month.

THE NORTHERN PACIFIC.—Surveying parties are out in various parts of the route, examining the country, and negotiations are at the same time pending, looking to an early commencement and vigorous prosecution of the enterprise. Those who have the matter in hand appear to be very decided with regard to an early completion of the work. Within a few months a survey to locate the line of the road, definitely, will be made, and the capitalists who have the enterprise in hand promise that it shall be commenced from the lake side at an early day.

THE SOUTHERN PACIFIC.—The new company which has this enterprise in hand are still at work with the end in view of an early construction of the road. A spirited railroad meeting was held in San Diego, last week, with the view of securing a large land donation, which may be offered as an inducement for the company to make that port its western terminus. The result of Gen. Fremont's visit to Europe is anxiously awaited.

BRAINWORK.—Hard thinking is the most exhausting of all labor. After long-continued muscular exertion comes the blessed balsam—sleep, to recruit the system. But when his brain has been upon the stretch all day long, slumber often flies from the pillow of the man of many anxieties, and schemes and cares. Even if he sleeps he carries his daylight thoughts and perplexities with him into his dreams, and repose does not refresh him. Let all who are troubled with restlessness from this or any other cause resort to Drake's Plantation Bitters for relief. This unequaled vegetable tonic and alterative is also a gentle anodyne—it soothes the over-worked brain, calms the agitated nerves, and soon, despite of care or grief or anxiety, "steeps the senses in forgetfulness." A dose taken at bedtime will secure a good night's rest, and another in the morning an appetite for breakfast and such a condition of the stomach as will promote digestion.

THREE HUNDRED large mahogany logs from Central America, at much lower rates than Eastern mahogany, at Hobbs, Gilmore & Co's Box Factory, Market street, near Bealo. **

New Mining Advertisements.

George Washington Silver Mining Company, White Pine, Nevada.

NOTICE.—The Annual Meeting of the Stockholders of the above named Company, for the election of Trustees for the ensuing year, will be held at the office of the Company, No. 10 Stevenson Building, S. W. corner Montgomery and California streets, on FRIDAY, the 23d day of July, 1869, at 4 o'clock P. M.. Per order.

THOS. J. OWENS, Secretary.

Ocean Fertilisers.

All along the Coastof New Jersey, it is well known, coral, composed largely of phosphatic and nitrogenous matter, is forming so rapidly as to threatsu interruption to navigation in some places. Being an excellent fertilizer, it is being collscted with strong forks and grappling hooks; aud in many instances the deposits are so large and heavy, that they cannot be lifted to the surface. By passing the entire mass through a crushing machine, everything is crushed to fragments. At the same time a liberal amount of dry muck is mingled with the coral for the purpose of absorbing the ammoniacal material, and thus retaining it until the compost can be applied to the soil. This new fertilizer promises to be a source of rich revenue to the State.

Again, according to Humboldt, there exists in the Atlantic Ocean, a little to the West of the Azores, a space seven times lnrger thau all Germany, completely covered with a dense mass of marine vegetation. M. Jules Lavinierd has proposed to the Societe d'Agriculture to make these floating meadows, as they are called, subservient to the purposes of agriculture. His suggestion is, that the ships occupied during the summer in cod fishing should, in other seasons, be employed in conveying this abnndant manure to the Azores, where an entrepot could be established, the weeds pressed and dried, and the mineral salts they contain extracted. Aualysis has shown that these weeds possess the same fertiliziug properties as those employed as manure on the French coasts. M. Lavinisrd calculates that these floating meadows produce annually sufficient vegetable mattsr to manure 1,350,000,000 acres of land. An extent of country equal to the entire area of the United States previous to the annexatiou of Alaska.

Lecture-Room Lightning—The Monster Coil.—In our summary of Scientific Progress for June 5th, we gave a description of the new monster induction coil at the London Polytechnic Institution. *All the Year Round*, in a recent article, thus describes the curious effects produced by the twenty-nine-inch spark in the lecture room: "In the darkened theater at the Polytechnic, the long flash lights up the room and the audience with the peculiar lurid glare so well known as an effect of brilliant lightning at uight, and displays the features and action of every one present. But it is curious to note that the flash being of instantaneous duration only, it allows no *motion* to be seen. We should think, if guided by our consciousness alone, that the flash lasted an appreciable time; but this would be an error, due to the persistence of the impression ou the eye, after the flash had ceased. If the room be made perfectly dark, and if the spectators all raise their arms and wave their hands to and fro as quickly as they can, the flash will display the position of the arms, but not the movements of the hands. *While the flash lasts, the hand has no time to move*, and is consequently seen, as if motionless, in the position in which the flash finds it. It is in contemplation to exhibit the same effect in a more complete way by affixing a picture to a revolving disk. When the disk revolves so rapidly that no outlines of the picture can be distinguished by meaus of any ordinary light, they will be perfectly seen iu a darkened room by the light of the flash. It lasts so short a time that the revolving disk does uot change its position in the brief period.

Preserved Pineapple.—Select nice ripe apples, pare them and tear them from the core with a eilver fork. Then weigh them, allowing a pound of engar to a pound of fruit. Pnt the sugar and fruit together in a preserving kettle and let them simmer slowly for an hour and a half. This preserve will keep for a year or two if sealed closely and kept iu a cool, dry closet.

An Excellent application for a Foot Wounded by a Rusty Nail.—Just as soon as possible after the foot is hurt put some hot ashes in half a pail of water and immerse the foot thereiu while as hot as cau be to be comfortable, and keep it in half an hour. This remedy will draw out soreness and inflammation. It has been tested and found effectual.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,

SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Aequires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Amoag other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iroa Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

GODDARD & CO.

San Francisco, May 1, 1868. 18v16tf

Machinery.

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

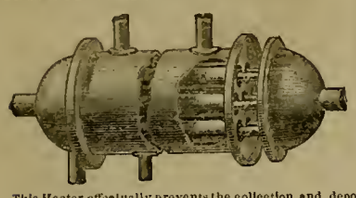
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, **220** Fremont street,

1v1 San Francisco.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

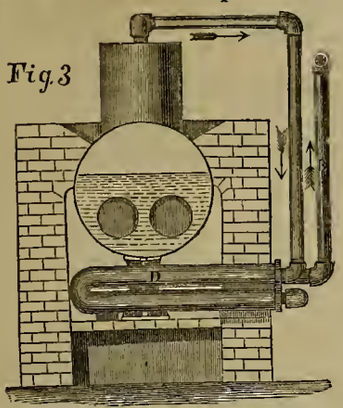
Important to every one using Steam for any purpose.

CARVALHO'S
Patent Steam Superheater

Fig. 3



[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1869.

"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after *seven* years of service.)

"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.

"Superheater saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.

"Superheater saves 20 per cent. of coal, less steam pressure, exhaust more serviceable in drying paper."

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.

"Superheater saves not less than 20 per cent. fuel; no priming!"

CROCKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.

"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y. DYEING & PRINTING ESTAB., Oct 4, 1867.

"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINUOUS OIL REFINING CO., Binghampton, N. Y., Sept. 20, 1867.

"Superheaters give entire satisfaction, and we superheat to 55 deg.—an increase of 20 deg."

CAREW MANUF. CO., So. Hadley Falls, Mass., Oct. 17, '67.

"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867.

"Superheater saves at least 25 per cent in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867.

"Superheater saves 25 to 30 per cent. in fuel; no priming."

CONTRA COSTA LAUNDRY, Oakland, July, 1868.

"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAVILAH M. CO., Cal., August, 1868.

"Superheater causes a use of 40 lbs. steam instead of 60 lbs; use much less water, and there is a saving of fuel." (2 sets.)

SIXTH MECHANICS' INST FAIR, S. F. Sept 4, 1868.

"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.

"Superheater is a perfect success, and saves three cords of wood in ten, or 33⅓ per cent. in fuel; engine works better."

And many other letters of the same tenor.

Information for Inventors and Patentees.

AN EXTRACT

From the American and Foreign Patent Agency Circular of the Mining and Scientific Press, Dewey & Co., Publishers.

Important Advantages.

Some of the advantages to be obtained by patronizing us may be enumerated as follows:

Inventors on this coast having their applications for patents made out through our agency, can sign their papers at once, and thus secure their rights *much sooner* than by trusting the same to distant agencies, situated at New York or Washington.

Many inventions on this coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use. A personal verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

By an able and faithful representative of our firm in Washington, our clients' applications are guarded against indifferent examination, unfair treatment in any contingency, and hazardous delays.

Patents for inventors on this coast are actually secured cheaper through our agency than any other, however flattering may be the inducements offered at the commencement by others.

Extensive practice gives us great facilities, securing regularity in the transaction of our business, which extends to EVERY COUNTRY IN THE WORLD where patent laws exist.

We assist in bringing valuable inventions to the general notice of the public throughout the Pacific Coast by illustration or description in the columns of the MINING AND SCIENTIFIC PRESS.

Confidential Advice.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice we make no charge. A pen-and-ink sketch and description of the invention should be sent together with a stamp for return postage. Write plain, do not use pencil or pale ink; be brief.

Remember all business committed to our care, and all consultations, are kept by us secret and strictly confidential. Our permanent business interests demand, as it were, a sacred compliance with our obligations as solicitors, and in reference to our strict fidelity in this respect we refer to one and all of the thousands of inventors and patentees on this coast who have patronized us.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service.

A majority of the Patents issued during the past eight years to Pacific Coast inventors have been secured through our Agency; consequently we can more readily and correctly advise new applicants than any other agent.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing the documents for a case, presenting it to the Government, and attending to all business connected with it, is $25 and upward. For cases demanding extra work and attention, only a reasonable fee in accordance with the services required, to do full justice to the case, will be charged.

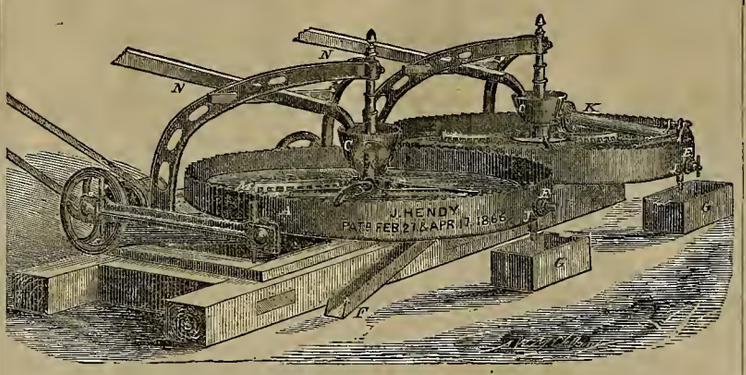
Following is the list of Government fees, payable in currency:

On every caveat	$10
On every application for a patent, for seventeen years	15
On every application for a design, for 3 yrs and 6 mos	10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Examiners-in-Chief	10
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

☞Our Illustrated Pamphlet, from which the above is an extract, will be furnished free on receipt of postage stamp. Confidential advice given, and every legitimate branch of Patent Soliciting business promptly and faithfully executed, by

DEWEY & CO.,
Publishers Mining and Scientific Press, 414 Clay street, San Francisco.

PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.



A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice. By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.

JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. W. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S. Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adas, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

W. T. GARRATT,
City
BRASS AND BELL FOUNDER

Cor. Mission and Fremont sts.,
SAN FRANCISCO.

Manufacturer of Brass, Zinc, and Anti-Friction or
Babbet Metal Castings;
CHURCH AND STEAMBOAT
BELLS,
TAVERN AND HAND BELLS AND GONGS.
FIRE ENGINES, FORCE AND LIFT PUMPS,
Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets, &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles,
HYDRAULIC PIPES AND NOZZELS
For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

☞Highest Market price paid for OLD BELLS, COPPER AND BRASS. 6tf

---

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSES.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y18p

MINING AND SCIENTIFIC PRESS.

Subscription, $5 Per Annum. Single Copies, 10 Cents.

A Journal of Useful Arts, Science, Mining, Farming, and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JULY 24, 1869.

VOLUME XIX. Number 4.

Table of Contents.

Scoville's Improved Side-Hill Plow—Illus..... 49
Have we Solved the Problem of Flying.—Illus.. 57
Capital in Mining..... 56
Increase of Temperature in Depth..... 50
English Patent Laws.... 50
Catching Whales by Electricity..... 53
Mining Items in Brief... 61
The State University.... 57
Resources and Develop'ts 61
Cal. Acad. of Sciences... 60
New Books 57
Peter Funk..... 55
Decidedly Frenchy..... 53
Patents and Inventions.. 53
To Correspondents..... 57
SCIENTIFIC PROGRESS.—Experiments upon Sound. Ling Flames; Geology of Texas; Explosion of Meteorites, etc..... 51
MECHANICAL PROGRESS.—For Foundrymen; Corrosion of Boilers; Pulverized Coal as Fuel; Tests of Turbines, etc..... 51
FAMILIAR SCIENCE—How to Read a Gas Metre; Tea—Why Old People Crave it; Flour, Good and Bad; Uses of Marrow, etc... 50
FARMING AND GARDENING.—The Harvest; Look out for Insects; The Flower Garden; Wheat Insects in California, etc..... 53
MINING SUMMARY.—California, Arizona, Colorado, Idaho, Nevada, Oregon, New Mexico, Wyoming and Montana..... 54
STOCK REVIEW.—Stock Circular; Shareholders' Directory; Markets, etc.. 53
New Incorporations..... 60

FRANCE BECOMING MORE SELF-SUSTAINING.—France, at the present time, appears to be in an unusual healthy state—financially. Her imports during the first quarter of the present year have materially decreased, while there has at the same time been a decided increase in her exports—an evidence that she is making unusual exertions to sustain herself independent of her neighbors, and other foreign nations. The importance of such a policy becomes especially apparent in view of the present political crisis, and uncertainty of the European status.

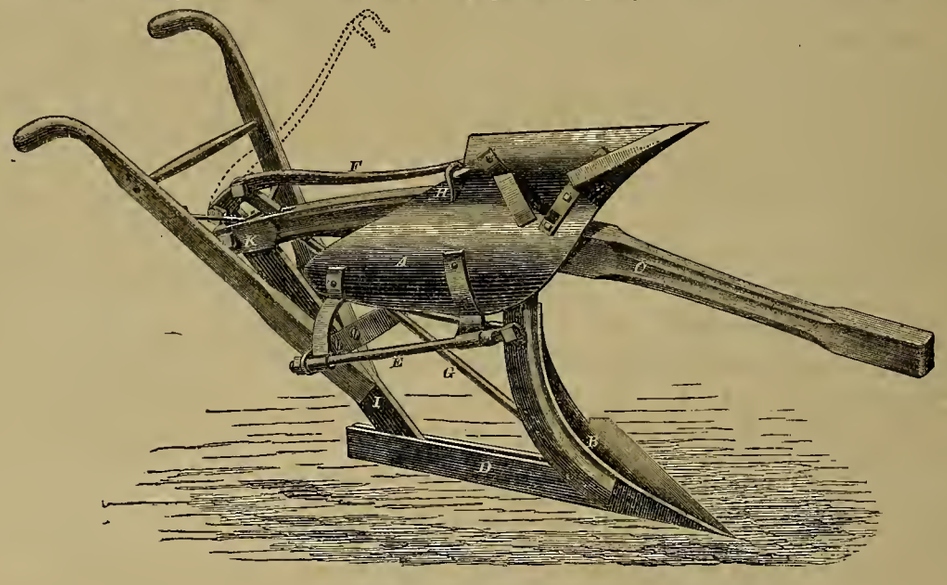
In the item of precious metals alone, her gain of imports over exports during January and February last, was not less than $6,800,000. Gold is the metal more generally retained; silver flowing out more freely. A favorable harvest, preventing the necessity for a large importation of breadstuffs, and a continuance of peace, added to other advantages, will give an immense increase to the national wealth of France, during the present year.

"OUR CHICAGO FRIENDS" appear to be having a good time generally. After being dined and wined *ad libitum*, in the city, and having seen all the great sights of the metropolis, they have gone to view the wonders of Yosemite and measure the "Big Trees." Some of our principal mine owners are making arrangements, on their return, to take them out and show them how we dig gold from our placers and pound out silver from the rocks. Our fruits and flowers have astonished them, while they have looked with amazement upon our broad wheat fields, waving with crops which are yielding forty, sixty, and even ninety bushels to the acre. It is well that the material wealth of our State should thus be seen and understood by our visitors. A new and increased enthusiasm will thereby be awakened in our behalf, and a more just and enlightened appreciation of the advantages which California presents for industrious laborers, will thus be disseminated among friends at the East.

CALIFORNIA WHEAT AT THE EAST.—California wheat is becoming more and more appreciated by Eastern millers, who now find it almost indispensable to mix with Eastern wheat in making their high grades of flour.

Scoville's Improved Side-Hill Plow.

Any improvement in machinery for tilling the soil and putting it in a fit condition to yield to the husbandman an increased quantity and quality of the necessaries of life, is important and profitable. This is especially the case where the invention accomplishes a certain kind of work with greater ease and more economically than other machines of the same class. A great portion of our State is of an uneven or hilly character, and these hills are covered with a very rich and productive soil. To cultivate them, a different arrangement and construction of the machinery from that used on the level or prairie lands, is necessary. The illustration herewith given represents an improved construction of side-hill or right and left-hand plows, invented by Messrs. Ives and Hiram H. Scoville, of Oakland.



SCOVILLE'S IMPROVED SIDE-HILL PLOW.

The advantages claimed for this plow over others employed for similar work, consist, first, in its being so constructed that the plow which is not in use is thrown up in such a manner as to rest its weight upon the beam, as shown in the engraving, where the plow, A, is firmly held by the hooks upon the end of the iron arm, F. The weight of the upturned plow is thus made to aid in keeping the opposite plow to its work in the ground, while the balance of weight is so equally divided as not to give an excess on one side. Its position is also such that it does not in any way interfere with the plowing, and the person who holds the plow can see to handle it as readily as though the mold-board was not resting upon the beam.

Second.—The handles of the plow, instead of reaching their ground support separately, are brought together and attached to the opposite sides of a metal bar, I, which rests on and is firmly secured to the heel of the land-side, D, and the end of the plow-beam at K. This arrangement gives to the plowman a much surer and easier control over the plow than when the handles are secured in the usual manner. The rod, G, is operated by the arm or lever, F, so as to lock the plow to be used in its proper position in the standard, by entering a slot in the toe of the land-side, D.

When it is desirable to use a single plow (as on level ground), either of the mold-boards may be quickly removed by loosening the nut, *m*, and removing the rod, E, thus converting it into a single plow. The mold-boards are hung upon two angularly-placed axles, one of which, belonging to the plow not in use, is shown at E, with its mode of attachment to the axis. The plow may also be used double, as for ditching, etc., by slipping a cap over the point of both plows when in proper position.

It is claimed that this is fully twenty per cent. easier of draft than most plows, by reason of the advantages already enumerated, added to the great acuteness of sheer. Its weight is 105 pounds; cost, $35. A manufactory for this plow has been established at Oakland Point, where it may be seen and any further information obtained. They may also be seen at Dorlman & Wolf's, corner of Clay and Drumm streets, San Francisco.

This plow has been successfully introduced, the following parties among others already having them in use: J. J. Reed, Marin county; A. F. Scott, Centerville; Geo. W. Shade, Watsonville; Jas. McCormick, Pescadero, and J. Wood, J. B. Gilchrist and J. B. Jones, of Spanishtown, San Mateo county. The inventors are ingenious and practical men, as has been evinced by several other important and useful inventions which they have already given to the public. A patent for this plow was obtained about two months since through the Patent Agency of this office.

THE MOON'S INFLUENCE.—Mr. Coffin, in his late book, "Our New Way Round the World," while writing of India, says: "The moon is at the full, pouring its rays from the zenith straight down upon us, with a power which is almost as unbearable as that of the sun at midday. There is no heat in its rays, but they have great effect upon the brain. The blood rushes to the head, and there is a sense of fullness and pressure which, although not attended by acute pain, is exceedingly unpleasant. We find it necessary to keep our umbrellas spread at midnight as well as at midday. It is dangerous to sleep in the moonlight in the tropics." Mr. Coffin fortifies his presumption of the supposed influence of the moon by the following quotation from the Psalmist:—"The sun shall not smite them by day, nor the moon by night."

BALLOON FRAMES.—A "balloon frame" is one which has few or no mortises. The studs are sawed off square, placed upon the sills, and several nails "toed in," to hold the stud in place, instead of holding it by mortise and tenon. The upper ends of the studs are secured to the plate in the same manner. This mode of building is very generally adopted in California, by reason of its comparative cheapness. A great saving is thus made, and when properly done, a house is nearly or quite as strong as when put up in the more expensive manner, by mortise and tenon.

PARKER'S BREECH-LOADER, noticed in the last number of the PRESS, may be seen at the Meriden Britannia Co's show-rooms, on the northeast corner of Sansome and Pine streets.

Familiar Science.

Tea—Why Old People Crave It.

The solid material or tissue of the body is constantly being worn out and wasted by labor. That which is thus worn out passes off mainly through the lungs and kidneys. The food introduced into the stomach supplies the material which, by digestion and assimilation, renews this waste.

Tea and coffee, and several other plants as well, contain a minute proportion from two to three per cent. of a peculiar substance known as theine. This substance, when taken into the stomach, has the remarkable effect of sensibly diminishing the quantity of this waste of bodily tissue. In middle-aged people, if this waste be thus diminished, less food will be required to sustain bodily vigor; hence it stands in the place of food—to a certain extent *saves* food.

With the old and infirm, however, it serves another purpose. With them the stomach is unable to digest a sufficient quantity of food to make good this waste. The consequence is a falling away of bodily proportions. Old people, no matter how corpulent they may have been in their younger days, are generally thin and spare from this cause. It is at this juncture that tea comes in as a *medicine* to *arrest* the natural and increasing waste of tissue; but not as a food to *replace* it. Hence tea is an especial favorite with the aged and infirm, whose powers of digestion have become so weakened that their bodily substance and stature are beginning to fail.

Effects of an Overdose of Theine.

Whatever may be said of the other properties of tea or coffee, the theine which they contain is perfectly innocent of harm when taken into the system in small quantities—as from one or two ordinary cups of tea or coffee. Three or four grains, which may be extracted from half an ounce of tea, may be swallowed by an adult without any unpleasant effects. Old teas contain more than those which are new. The Chinese, without understanding the philosophy, but fully distinguishing the effects between old tea and new, never drink tea until it is a year old. The unpleasant effects of an overdose of theine are, a quiet pulse, stronger heart-beat, general trembling, an excited imagination, which may even reach to a seeing of visions, and a peculiar state of intoxication, followed by deep sleep, during which all these symptoms pass off.

How to Obtain Theine—Its Composition.

Place some dry and finely-powdered tea leaves in a watch glass and cover the same with a conical cap of white paper; then place the glass on a hot iron. After a while a white vapor will be observed to rise, which will condense in minute colorless crystals on the inner surface of the paper cover. These are crystals of theine. When obtained from coffee they are almost identical in composition, and are known as caffeine. Another way is to evaporate to dryness a strong decoction of tea or coffee, and treat the dry powder so obtained in the same manner as the powdered tea. Green teas generally contain the largest amount of the substance, which is colorless, without smell and of a slightly bitter taste. Its composition is as follows:

Carbon	49.80
Hydrogen	5.08
Nitrogen	28.83
Oxygen	16.29
Total	100.00

The chief peculiarity of its composition consists in the large amount of nitrogen which it contains—a proportion contained in but very few other known organisms.

Boy's Steel Test.—The boyish test of good steel or good tempered steel blades, made by breathing on the polished surface, and noting the time of the evporation, has lately been claimed by a prominent English mechanic to be founded on correct principles.

How to Read a Gas Metre.

It is the privilege of every gas consumer to know, for himself, just how much gas he is consuming, and a few minutes practice will enable any one to "read the metre" readily; while such knowledge, besides affording a wonderful degree of satisfaction to the possessor, often brings about a much better feeling between the consumer and seller of gas. The N. Y. Gas Light *Journal*, furnishes the following plain and simple directions for acquiring such knowledge: The metres in ordinary use have three indices. The hand on the first or right hand index moves to the right as the figures read, and each index begins at a cypher (0) at the top and reads, 1 to 2 to 3 and so on to the cypher again, which is 10. When the hand on the right index has moved to 1 it indicates that 100 cubic feet of gas have been used or passed the metre; when it points to 5 it means 500 feet, and after completing the circuit at (0) it is 1000 feet. Each of the indices are ten fold multipliers of the one preceding. Single figures are used for want of room, but the multiplier is generally placed above the index; thus the right hand is "one thousand," the next to the left or middle index is "ten thousand," and the last or left hand index is "one hundred thousand." Therefore on the first or right hand index, 1 on the dial stands for 100; in the middle index 1 stands for 1000; and one on the right hand index stands for 10,000 and so in this ratio with the succeeding figures respectively.

To read the metre, begin with the left index and write down the figure last passed by the pointer; then write down the figures last passed on the second index, and proceed in like manner with the third or right hand index. Now add two cyphers (00) and it will give the amount of gas registered in cubic feet. Suppose the first index was 2, the second index 5, and the third index 6, making 256, now add two cyphers and you will have 25,600, being the amount of gas used at that time.

At the end of the month (or at any other time) read the metre again and the figures will read—say 26,500 after adding the cyphers; now deduct the first sum from the last and you will have the difference 900, which indicates the number of feet used since the previous reading.

Flour—Good and Bad.

To grind wheat into flour with the greatest advantage, the millstone should make about sixty revolutions a minute; if run faster, the stones heat and thereby injure the flour; if slower, the flour adheres to the bran, so that it cannot be properly separated in the process of bolting.

Flour, when kept too long in an ordinary atmosphere, loses an undue portion of its moisture, and acquires a disagreeable taste. When such flour is made into dough it absorbs a larger amount of water than is consistent with the production of good bread, although it looks whiter and smoother. Bakers often use old flour for the reason that the bread looks better and weighs more to a given amount of flour, from the fact that it absorbs and retains through the process of baking, more water than new flour.

Experiments have shown that 3½ lbs. of flour, kept one year in a dry place, absorbs two pounds of water in being converted into dough, and lose ten ounces in the process of baking. This result, however, varies with flour of different qualities.

Flour that has been damaged by being heated in grinding, does not mix thoroughly with water in being converted into dough. To remedy this trouble bakers sometimes dissolve a small quantity of alum in the water.

When chalk, lime, bone-ash, etc., has been mixed with flour, as these things sometimes are, the adulteration may be detected by carefully burning the flour in a crucible. The flour will disappear, while any calcareous or silicious mixture will remain.

Carbolic Acid, it is stated, can be deodorized. Two parts by weight of gum camphor are mixed with one part of crystallized carbolic acid. After this compound has been well rubbed together, it is mixed with whiting, and in that form is said to be a valuable disinfectant and a good protection to furs in summer.

Uses of Marrow.—The French Academy of Sciences has received an interesting communication from Dr. Neuman, on the physiological action of marrow in the animal economy. In his opinion this substance contained in bones plays an important part in the production of blood, and red cellulee are constantly being formed in it. He remarks that when the elements of the red marrow of bones are examined in the human frame and in that of the rabbit, one always finds red blood cells, each containing a nucleus, clearly distinguishable, by their yellowish hue, from other cells resembling corpuscles of lymph. Some of the former have a simple nucleus; others contain one divided in several parts; and in some the nucleus seems to have disappeared altogether. Dr. N. thinks that the cells of marrow resembling those of lymph are an element from which new red blood cells are being constantly formed, in order to replace the elements of the blood which are being constantly destroyed, either by physiological or by pathological action.

Increase of Temperature in Depth.

The increasing ratio of the temperature of mines as they descend was investigated a second time by Mr. R. W. Fox. His observations will be found condensed in the appended table. Amongst other curious incidents contained in Mr. Fox's report, may be mentioned the following: The Levant copper and tin mine, near the sea, is 255 fathoms deep, and nearly 230 fathoms below the sea level, under which it is horizontally extended in slate rock. The temperature near the end of this level was found to be 84.7° on one side and 85.5° on the other; the drainage water 85.5° and the air 85°. In 1853, the temperature of the rock in this level when it was not extended so far westward under the sea, was reported to have been 87°, and the granite rock at the same level eastward of the shaft, 74°. The engine house of the Botallock copper and tin mine is built on a rock washed by the sea. The western levels of this mine are extended more than half a mile under the Atlantic. At a level 180 fathoms under the sea level, the rock near the end of the level was 79° on one side and 79.5° on the other, the air being 81°.

Mines.	Depths in Feet.	Dates.	Temperatures.	Increase of 1° in Descent.	Rocks.
Par Consols (tin in part)	768	1837	74° —50=24°	32 feet	Slate.
Botallock (copper and tin)	1,128	1837	79° —50=29°	39 feet	Slate.
Par Consols (copper in part)	1,248	1837	84° —50=34°	36.7 feet	Slate.
Dolcoath (copper and tin)	1,380	1822	75.5° —50=25.5°	54 feet	Granite.
Swant (copper and tin)	1,530	1853	74° —50=24°	63.7 feet	Granite.
Dolcoath (copper and tin)	1,530	1853	87° —50=37°	41.3 feet	Slate.
Swant (copper and tin)	1,530	1857	85° —50=35°	43.7 feet	Slate.
Trisavern (copper)	1,672	1857	82.5° —50=32.5°	48.4 feet	Granite.
Dolcoath (copper and tin)	1,632	1857	73° —50=23°	71 feet	Granite.
Dolcoath (another lode)	1,632	1857	79° —50=29°	55.3 feet	Granite.
Tresavean (copper)	2,112	1853	90.5° —50=40.5°	52.1 feet	Granite.

Humboldt estimated 100 feet vertical to 1° of temperature, above ground.

The Southern Railroad.—Nearly all the Southern Railroads borrowed money at the North before the war, and the obligations therefore were confiscated and collected by the Confederacy. Since the restoration of peace, the northern creditors have called for their dues, and the roads are holden for them. That's what's the matter with the Southern Railroads, and the reason why their stock is so nearly worthless.

The English Patent Laws.

The English journals are full of discussions upon the above named subject. A resolution was recently debated in the House of Commons, which proposed to abolished the patent laws entirely. It met with so much opposition that it was subsequently withdrawn; but although many members objected to the extreme course proposed, the majority were in favor of an entire remodeling of the patent system. No wonder. It is time. The system is a disgrace to a civilized nation. An English patent is a perfect marvel of long-winded and elaborate vagueness. No specific "claim" being required, as with us, the "specification" does duty, in its place; and the consequence is, that the maker of said specification lays himself out to cover all the ground within his reach. He revels in circumlocution; he allows the diarrhœa of words to flow unchecked; he leaves his reader, or whomsoever it may concern, in the desired state of confused doubt at the end, as to what he really does claim as his invention; and he provides a hundred ingenious chances for future litigation,—of any one of which he can avail himself, in case it should hereafter appear to be worth his while.

There seems to be a wish, on the part of the thinking ones, to adopt the American patent system. They are fully aware of the abuses current and possible under their own, and it is probable that the present agitation of the subject will result in such adoption, so far as is consistent with English pride. The two principal journals among those especially interested in patent matters, *The Engineer* and *Engineering*, take a sensible view of the subject. The first says:

"An examination of the arguments brought forward in the debate of last Friday shows that all the objections to patents fall under two main heads—the careless and ignorant way in which they are granted, and the careless and ignorant way in which patent cases are judged in our courts of law. It is complained elsewhere than in the House of Commons that patents are granted for frivolous and insufficient inventions, or for no inventions at all; that notoriously old things are continually being repatented; that the descriptions are insufficient, and that the laxity of the law favors fishing and fighting patents; that the descriptions and drawings are insufficient and inaccurate. All these objections are perfectly true, but they apply not to the principle, but to the administration of the law. Let there be a preliminary examination, as in America, with respect to at least novelty; let not merely drawings, but also models, be required from the patentee; let additional facilities be given for ascertaining the novelty, or the amount of novelty, in a patent; let each patentee again, as in America, be required strictly to define his claims; let every patent agent be subjected to examination and be liable to disbarring, instead of, as now, allowing ignorant boys or swindlers to practice. There are people now practicing in London and elsewhere as patent agents who do not even know the English language; who scarcely know a pump bolt from a cow's tail, and who have not the slightest idea of the laws, whether of patents, of mechanics, or of common honesty."

Engineering says: "In nearly all cases there is really nothing but a necessarily meagre "provisional specification," to examine a document unaccompanied by drawings, and from which even an expert could hardly be expected to form more than a rough general notion of what the invention really was. Once in a great while a patentee deposits a complete specification at the start, but even this is but seldom examined with any other purpose than the possible detection of clerical errors. It is upon a wretched and unexamined provisional specification that the inventor receives the Great Seal, and all the privileges of a patent; after which he files his complete specification, which may contain almost anything he likes, so long as it can be made to tally, generally, with the terms of the provisional specification. Thus, men who deliberately patent contrivances of no value for the purpose of tripping up others, have every possible encouragement."

Mechanical Progress.

For Foundrymen.

Mr. J. Anderson, C. E., Supt. of machinery to the War Department, recently lectured before the Loudon Society of Arts, upon "Applied Mechanics." In the conrso of the lectnro, he took occasion to spoak in high terms of the American fonndrymen. He said that they studied crystallization, the molecular structure of motals, and other subjocts bearing npon their art. The direction of crystallization in cast iron, when cooliug, "is detormined by the lines into space which the heat takes;" and consequontly if we introduce into castings irregularity of figuro, or anything which creatos currouts outwards in various directions, we introduce lines of weakness. The rato at which the heat is hastened out of the casting, must also bo regarded. Whero great hardness is required, rapid cooling is necessary; but whero ductility is wanted, as in a gun, the hoat is allowed to go out slowly. The Amorican cast-iron guns stand well, for both tho points above referred to are regarded iu the casting. Every part of a casting should cool, too, at the samo rate. The parts which from their loss substance, would cool first, must bo kept hot by oovering with fire or somo other means. The Americans nre more careful, too, than tho English, in regard to the allowing gas to form within the mold. Mr. Babbit uses old firebricks, which have long been in use, for his molds. Those which are at all discolored are rejected; the others are ground up, and mixed with pipe-clay to secnre ndhesiveness. When used, the mold is heated red hot, and in that stato receives the molten metal. Not a particle of gas is generated.

Corrosion of Boilers.

An article upon this snbject hy Norman Wheeler in *Van Nostrand's Magazine*, takes the ground that the corrosion of boilers worked in connection with surface condensers,—geuerally attributed to galvanio action induced by the condenser,—is dne rather to the chemiccl changes that take place, and is consequeutly the cause, instead of the effect, of whatever galvanic action is noticeable. As a proof of his position, he instances the following case, which occurred in his practice in 1864:

"Four vessels wero built for the Government, with return flne hoilers and "high pressure" engines, but the steam was condensed, for the sake of fresh feed water, in open surface condensers; the steam spaces in the condensers communicating with the atmosphere through pipes. The condenser tubes were made of iron and galvanized, for the purpose of avoiding the corrosion of the boilers. The feedwater was drawn by the feed-pumps directly from the condensers. As a matter of conveuience, the ntmospheric pipes were led from the condensers snd opened into the smoke pipes, so that when an exhaust took place, the vapor was for an instant driven out through the atmosphorio pipe, nnd hecsuse of the continuous condensation, the gases in the smoke pipe were drawn back toward or into the condenser between the successive exhausts, thus keeping up a pulsation and swaying baok and forth of vapor and gases in the atmospheric pipes, which, although made of copper, were eaten into holes in a few days. The pipes passed overhead through the fire rooms, and the continual dripping of hot water made those places very uncomfortable. The corrosion of the boilers was marked and unmistakable within a month.

The atmospheric pipes were theu changed and led to the open air, and the corrosion of both boilers and pipes apparently ceased.

It is supposed that carbonic acid was absorbed rapidly by the vapor nnd condensed water in the atmospheric pipes, the supply being dcrived from the gases of combustion, nnd the acidulated water passed into the boilers by the feed-pumps.

Now, it it bo proven that the water, while exposed in the hot well of an ordinary engine, absorbs oxygen and separates it from the nitrogen of the air, nnd that the nascent carbon of the oils, used to luhricate the intornal parts of the engine, is seized by the oxygen whcu tho oils are decomposed by tho heat of the steam, wo shall bo able to account for an amount of carbonic acid iu the boilers working in connection with common surfaco condensers, sufficiont to destroy them rapidly."

PULVERIZED COAL AS FUEL.—Mr. Thos. R. Crampton has been experimeuting upon a furnaco which shall secure, as nearly as possible, complete and instantaneous combustion of fuol. At present, from one-half to three-fourths of the coal burned is *wasted*. The ooal is reduced to powder by means of ordinary mill-stones, after having first passed through a crusher. A blast of nir passes between the mill-stones, keeping thom cool, and carrying away the fiuo dust as fast as produced. A kind of injoctor, formed of a conical pipo or nozzle, receives the powdered dust as it is fod from a hopper. Within the first nozzle is a smaller one through which a blast of air is forced. Instead of introducing tho mixed air and coal dust directly into tho chamber, where the heat is to bo utilized, it is forced through n long chamber with baffling screens, to give time for the combustion to become complete before the hot gases, thus produced, are brought to the point where the heat is required.

FAC-SIMILE TELEGRAPHING.—Meyer's apparntus for telegraphing, employed in the French service, does not give merely a copy of the message sent, but n *fac-simile;* so that telegrsphic dispatches present, as regards exactitude and authenticity, all the guaranties found in postal communications. The Ahbe Caselli's *fac-simile* of messages, reproduced by chemical processes, presented serious imperfections, which often rendered the deciphering of the message diffioult, giving rise to doubts as to the authenticity of the writing. M. Meyer has avoided these difficulties by mechanical means.

TESTS OF TURBINES.—A scientific test of wheels of this kind is now going on at Lowell, Mass. A number of scientifio men are present, and many wheel builders from different sections of the country. Hiram F. Mills, C. E., of Boston, superintends the experiments, in proparation for which several thousand dollars was expended. The different wheels are tested in reference to velocity of discharge, number of revolutions, temperature of the water, variations of head and resistance,—and everything carefully noted.

PULLEYS COVERED WITH LEATHER.—Van Nostrand translstcs from *Polyt Centralblatt* an article on this subject. The objections to the various methods which have been tried for preventing the slipping of bands upon pulleys, are recounted; and the covering of the pulley with leather declared to be free from all of them. The leather is fixed by a kind of cement which adheres firmly to both iron and leather.

BELT FOR A OIVEN HORSE-POWER.—F. W. Bacon gives this rule for proportioning the belt to drive a given horse-power: "Multiply the horse-power required to be transmitted through the belt by 36,000. Divide the product by the nnmber of feet, or parts of a foot the belt is to run per minute; divide the quotient by the number of feet or parts of a foot in length of that part of the belt in contact with the smaller pulley; divide the last quotient by 6, and the result will be the width of the belt in inches."

IMPERIAL GREEN.—This new pigment, of French invention, is the sesquioxide of chromium. It is brilliant, cheap, and not poisonous. The inventor starts with a solution of ony salt of chromium, which he boils with appropriate reagents to obtain the green modification; to this he adds either gelatinous alumina or recently precipitated hydrated oxide, carbonate or sulphide of zinc, in just sufficient quantity to saturate the acid. The reaction takes place quickly, but may be accelerated by heat. The precipitate has only to be washed and dried, and is ready for use.

Scientific Progress.

Experiments upon Sounding Flames.

A. Weinhold, of Chomnitz, recommends a very simple contrivance, to ohtaiu flames of great sensitiveness to tones or noise, with ease and certainty. A pressure of at least an inch and two-tenths of water is necessary to the production of a sensitive flame, and as this cannot nlways he had, a gasometer can be contrived out of a bell jar suspended by a cord running over n pulley with a scalo pan nttached to the end for weights, with which to rogulate the pressure. The bell jar can be dippod into n large vessel, and filled with gas by syphon. A three gallon jar will furnish sufficient gas for more than a minute, and can easily be replenished. Weinhold recommends certain precantions:

"The flow of gas must be through capacious tubes so that the pressure can not be diminished near the burner. A half-inch tube is necessary if the pressure does not exceed one nnd a quarter inches. The india-rubber tubes must also be capacious. The gas where it flows out must not make the least noise. Such an effect is sometimes produced by the roughness in the sides of old tubes or imperfection in the stop cocks. The burner must be a simple hole with a wide opening, a sharp angle and smooth sidos. Glass tubes drawn out to five-hundredths of an inch in diameter serve a good purpose. A cyliudrical piece of soap-stone serves better than glass, as it is not liable to crack. The best results are obtained with n burner the inner diameter of which at the point of ignition is 0.08 of an inch, and in n length of one inch widens to two-tenths of an inch. Such a burner consumes 19 cubic feet of gas per hour, and gives the flame 19 to 23 inches in length. At every noise the flame shortens and divides itself into two distinctly separable parts—the lower, cylindrical, quiet—the upper, wide, illuminating and rustling.

By uttering hissing consonants, the flame is shortened one-half: OO in deep tones has no effect; A and Ae act powerfully. The rustling of tearing of a piece of paper, the striking together of two pieces of glass, the ring of a bundle of keys, the ticking of a watch, all produce a marked drawing together of the flame. A shrill whistle causes the flame to assume a swallow-tail shape."

Geology of Texas.

The London Geological Society has just republished, in English, Herr Roessler's sketch of the geology of Texss. We condense as follows: Texss offers a complete series of deposits from Palæozoic Potsdam Sandstone up to the highest Tertiaries. A bed of bituminous coal is known to exist near Fort Belknap. The Carboniferous formation has been stated to extend over 5,000 square miles of surface, and to be 350 feet in thickness. The thickness of the Cretaceous deposits probably exceods 1,500 feet; they are distinctly stratified, generally fossiliferous, coralline limestones, particularly well developed in the Comanche summit, 650 feet above the level of the Rio Brazos, where they appear under the form of white hippurite limestones, overlying a bed of gray limestones, whose strata extend about 70 yards westward and form a low slope; they are filled to the depth of 30 feet with organic remains. The Tertiaries consist of sandstones and limestones. Remains of *Zeuglodon cetoides* have been found in the hill-range of the Rio Colorado, and bones of *Mastodon giganteus* and *Elephas primigenius* on the Rio Brazos. The calcareous sandstones and dolomitic limestones in the western region, are rich in silica, and furnish marbles of superior quality.

The Azoic rocks include extensive beds of magnetic iron ore. Enormous masses are spread over the snrface about Johnson's creek; a hill, rising 45 feet above the level of the river Llano, is one solid mass of iron ore; its depth is unknown. The ores, analogous to those of the Iron Mountain of Missouri, nre partly magnetic, partly specular oxide of iron; they contain on an average 96.890 per cent of per- and protoxide of iron, with 2.818 per cent of insoluble siliceous substances, nnd give 74.93 per cent of metallic iron. This iron regiou is surrounded by ridges of granite, intersected by veins of quartz. Wood abounds in the environs.

Superficial indications of the existence of great quantities of petroleum helow the surface are not nufrequent in the environs of the "Four Lakes" (Harding county). This locality belongs to the Miocene period, forming a zone 50-75 miles in breadth and extending several hundred miles in length along the coast.

RATIONALE OF DOUBLE REFRACTION.—Prof. Tyndsll, in a recent lecture at the Royal Institution, reported in *The Engineer*, said that in air, water, and well-annealed glass, tho luminiferous ether has the same elasticity in all directions. There is nothing in the molecular grouping of these suhstances to interfore with the perfect homogeneity of the ether. But when water crystallizes to ice, the case is different; here the molecules are constrained by their proper forces to arrange themselves in a certain determinste manner. Thoy are, for example, closer together in some directions than in others. This arrangement of the molecnles carries along with it an arrangemeut of the surrounding ether, which causes it to possess different degrees of clasticity in different directions. In a plate of ice, for example, the elasticity of the ether in a direction perpendicular to the surface of freezing is different from its elasticity in a direction parallel to the same surface. This difference is displayed iu n peculiarly striking manner by Iceland spar, which is crystallized carbouste of lime; and in consequence of the existence of these two different olasticities, a wave of light passing through the spar is divided into two; the one rapid, corresponding to the greater elssticity, and the other slow, corresponding to the lesser elasticity. Where the velocity is greatest, the refraction is least; and where the velocity is least the refraction is greatest. Hence in Iceland spar, as we have two moving waves with different velocities, we have double refraction. This is also true of the greater number of crystalline hodies. If the grouping of the molecules be not in all directions alike, the ether will not be in all directions equally elastic, nnd double refraction will infallibly result. When a beam of light passes through ice perpendicular to the surface of freezing, or through Iceland spar parallel to the crystallographic axis, there is no double refraction.

THE INFLAMING POINT OF VAPORS.—Mr. Hutton, of Glssgow, has recently made experiments to determine the degree of heat at which the vapors of various explosives take fire from a burning candle at a given distance. The *Gas-Light Journal* prints a table showing the result in rogard to a number of substsnces, and adds in comment: "The crude nsphtha of the specific grsvity of nearly 0.89, contained considerable portions of tarry substance and naphthaline, but it nevertheless took fire at a lower degree of hest than refined nsphtha, the specific weight of which did not exceed 0.86. That a liquid which contains but a small amount of a very volstile fluid msy he dangerous, is seen, for instance in the experiment with the light oil from coal tar. This oil inflames from the light of a candle at 119° Fah. when approached within a distance of one and a half inches. When compared with the great inflammability of hisulphide of carbon or benzole, the tar oil may be considered as of little danger, but it is just as dangerous when it is taken into considerstion that the great inflammability of bisulphide of carbon is well known, while the tar oil is looked upon as heing comparatively harmless. In the preceding case, the liquid portion, which generated inflsmmable gases at 119° Fah., did not amount to two per cent. of the whole, and after their sepsration, vapors were not given off below 179.5° Fah."

EXPLOSION OF METEORITES.—The *Journal of the Franklin Institute* translates tho following from *Les Mondes:*

"M. Swaim proposed before the Academy of Sciences the following explanation of the detonating explosion of meteorites. It has been proved that usually the aërolites which reach the sphere of the earth's attraction, contain a large proportion of hydrogen. Is it not then probable that in their passage through the atmosphere, they also absorb a large amount of oxygen or air, so that the mixture of the two gases beoomes explosive, and in fact explodes when the temperature either from resistance or the friction of the air becomes of sufficient intensity?"

COLD PRODUOED BY A GALVANIO COUPLE.

M. Favre has communicated a paper to the French Academy, in which he points out the fact that certain galvanic couples, instead of giving out heat, nctually absorb it, and thus produce cold. Such a couple is one composed of platinum and cadmium, the exciting liquid being hydrofluoric acid.

Farming and Gardening.

The Flower Garden.

Numerous bouquets of California flowers have been sent to the East since the opening of railroad communication. Of course such houquets must he composed of rosehuds and such other flowers as do not perish readily. A common way of sending them ie to gather and pack them in a box with cotton, which has been eaturated with water. Press them down a little, but not too tightly, and perforate the box with eeveral small holee, eo that there may be a little circulation of air. Bouquets so eent East arrive in ahout as good a coudition as when taken from the bushes. Rosehuds so arriving, if gathered into a bouquet and placed in water, will soon open with heautiful full-hlown roses, as perfect as if they had been left on the hush. So we have been told.

The Germans, in fader-land, we have seen it stated, have a method of keeping rosehuds freeh iuto winter, which consists in first covering the end of the stem, as soon as cut from the bush, with borax, and then placing each hud in a paper cap or cone, so that the leaves do not touch the paper. The cap is then coated with glue, to exclude air and dust, and when dry it is carefully placed in a standing position in a cool place, hut secure from hard frost.

When wanted for use, the bud is taken out of the envelope, the waxed end cut off, and the stem placed in water, when the rose will soon appear in full bloom.

Watering Plants in Summer.

It is not wise, says an exchange, to hegin to water plants unless it is intended to follow it up thoroughly. If plants are watered but sparsely, they throw out their little roots near the surface in order to drink in the moisture; and if afterwards the watering he neglected, these little fibrous roots perish for lack of moisture and the plant suffers. When they are not watered at all, the little roots go down deeper in eearch of moisture; and in well cultivated soil, in good condition, they will usually find enough to keep them from suffering, unless the drouth continues unusually long. If it seem necessary to give water, it should be copiously and in quantity sufficient to go down to the hottom of the roots; a sprinkling that wets the surface is worse than none. Syringing the leaves to wash off the dust, if done in the evening after the sun is down, will improve the appearance and health of plants.

Water for this purpose, however, should never be ueed directly from a well or water pipes. It should he first pumped up or drawn off into a barrel or other reservoir. Water much colder than the atmosphere exerts a chilling influence upon plants, which is highly injurious. On the other hand, water tbat is warmer than the atmosphere has a most wonderful effect over that which is oolder, in exciting the growth and vigor of plants. It is astonishing to ohserve how very *hot* water may be advantageously used for sprinkling upon plants.

Look out for the Insects.

We have elsewhere, in the present issue, oautioned our farmers to look out for the insects injurious to wbeat. The weeds, too, must be more carefully watcbed, from this time out, than they have been heretofore. We have already, iu previous numbers, alluded to this matter, naming the weeds whioh are threatening damage hy their pestiferous character or multiplication. All these things come as the result of cultivation. Like the birds and house vermin, they always follow close upou the heels of civilization, and they need our constant and watchful care lest they get the advantage of us. A correspondent of the Santa Cruz *Times* enumerates some of these field pests which have not heen hefore alluded to iu the columns of the *Mining and Scientific Press*. We copy as follows:

I notice in a late number of your paper a paragraph headed "Those Thistles." If you mean a large coarse thistle with smooth and shining leaves, spotted green and white, and with pink flowers, we have it here also, and you do well to call the attention of everyhody to the great necessity of eradicating it as soon as possihle. It is from the south of Europe, and no one can tell how it got here. It was first noticed hy hotanists in this country at Knight's Ferry, in the interior of this State. Its hotanical name is *Silybum Marianum*. It has no American name that I know of, except the "Spotted Thistle." It is a great nuisance.

Another plant, quite as noxioue, is the Maltese thistle, *Centaurea Militesusis*, from island of Malta. This is short, thorny all over, very stiff, and with small yellow or pink colored flowers. It grows among the grain crops, and is very hard to cut, bind or thresh. It was first introduced at Monterey, I believe from a French ship, and is spreading rapidly over the country.

A third is worse, if possible, than either of the others mentioned. It is the thorny clothurr, *Xanthium Spinosum*; a stout epreading plant, with many short thorns, and the burs are seed pods covered with hooked prickles, worse for sheep aud their wool, than the common clot-hurr; hesides heing a large, bushy plant that takes up a great deal of ground.

Anotber introduced weed, that is very ahundant in the Pajaro hottom lands, hut which is, perhaps, not so much of a pest as some of the others, is a sort of *wild radish*. *Raphanus raphanistrum*, with large pods.

It would he of vast benefit to the State if these could all he exterminated; but in a new and thinly settled country like ours, it would now be almost impossihle to prevent them from growing and spreading.

Only Forty Bushels.—According to the Castroville *Argus*, the sandy hills in that region, where the land is rented for only one dollar an acre, are yielding a full average of twenty bushels of wheat—equal to the highest average of any State east of the Rocky Mountains. The *Argus* man met a friend, a few days ago, whose farm was located in the richer bottom lands of that region, and who was growling because his wbeat was turning out *only forty bushels to the acre!* This incident reveals the habit which the farmers in our rich bottom lands have got into of thinking very poorly of a crop which don't turn out 50, 60, or 70 bushels to the acre. Anything uuder fifty is a poor yield with them. What would the wheat growers on the hest lands of the "Great West" think of such yields?

The Harvest.—The grain speculators have been unable to make a "failure" out of the wheat crop. The *smut* and *rus* wouldn't stay; and the beaten-down grain would get up in spite of all that the subsidized press could say ahont it. There never has been snch a crop as is now being harvested; and the greatest trouhle now about the crop is to get men enough to gather it in, and transportation sufficient to take it to a market. It is thought hy some that the increase will be fully twenty-five per cent. over any previous crop. Those figures are prohahly too high. It will, at any rate, be sufficient to gladden the hearts of all concerned; and we trust its proceeds will result in well-filled pockets for the growers. A cotemporary very properly urges that more care should be taken by harvesters in cleaning and sacking their grain; for unless this is attended to more properly than heretofore, many farmers will find tbeir grain neglected hy shippers on account of its foul coudition.

Wheat Quotations for the Week.

New York telegrams of Monday quoted California wheat at $1.65@1.73. Yesterday it had advanced to $1.70@1.77.

Liverpool wheat quotations on Tuesday were 10s. 6d.; Wednesday, 10s. 4d. On Thursday they had advanced oue peuny, and again another penny on Friday—staudiug, as on Tuesday, at 10s. 6d.

Hongkong dates of June 19th quote California wheat at 2.40 per picul.

Salinas Valley.—It is said hy men who have traveled extensively through the State, that the crops in the Salinas Valley excel any portion of the State.

Wheat Insects in California.

Very little damage has bitherto been suffered on this coast, from the ravages of any of the various insects which interfere with the production of wheat. But unless the utmost precautions are employed, such inscets *will* come, and tbeir advent will be attended with great loss to the farmer. It would appear from the following, which we clip from the *Pajaronian*, that one of the most distrnctive of the wheat insects has already made its appearance in the neigbborhood of Watsonville, Santa Cruz County. That paper of tbe 15th instant says:

Mr. Knapp, of this place, brougbt into town yesterday, a hunch of wheat which partly solves the problem of the light wheat crop of this year. Iu the joint of many of the stalks were curious little worms, which some call the "Hessian Fly," and is the same insect that some yeare ago greatly injured the wheat crop in Pennsylvania and the Eastern States. Farmers with whom we have conversed seem to be doubtful ahout there heing rust enough to injure the grain, and many have said that the reason of the partial hlight was incomprehensihle to them. Probahly if farmers will examine closely the stalks of wheat they can find the prohlem solved by the presence of this strange insect.

An Insect at the Root.—A gentleman of Alameda County informs the editor of the Castroville *Argus* that "the wheat fields where the crop is light, are infested hy a small insect that attacks the *roots* of the plant, cutting them off. He was led by noticing the seeming absence of cause where heads were light to pull up the stalks and examine the roots, which he found to be cut off, and eaten by the little destroyers, who were present in great numbers. The effect of this destruction of roots is the absence of kernels in two of the six rows of the heade, and a blanching of head and stalk, so that the infested fields present a epotted appearance, the healthy grain heing of a golden color with heavy drooping head, the other of a pale whitish hue, with the heads erect. The ravages of the iusect is confined to no particular locality, but is apparent in patches amidst the finest crops.

The only difference seems to he between the fields plowed early and those plowed late, the former heing almost entirely free of them; another argument in favor of small farms, that can be properly cultivated."

The closing paragraph, quoted above, contains a most significant hint, whicb it would be well for farmers, everywhere, to consider most carefully. Good cultivation is the great preventive of almost all the trouhles and pests that meet the farmer in the field. We cannot have healthy plants, with imperfect culture; and it is seldom that healthy plants are attacked either by insects or *fungi*. We doubt if smut or rust ever attacked a perfectly healthy field of wheat. Tbe Hessian fly seeks ont a dieeased stalk in which to deposit its eggs, from which come the "curious little worms," mentioned by the ahove correspondent of the *Pajaronian*. The "late plowed land" is that wherein tbe plant roots are attacked in Alameda County. When a wheat field is plowed and sown late, in this country, there is not, as a general thing, sufficient moisture present to properly germinate the seed. The heat will find an easy access to the seed, and as easy escape from it. The consequence is, if the seed germinates at all, it seuds up a weak and feehle stalk, which never can produce a healthy kernel; and which holds out a oonstant and standing invitation for the attacks of the various *fungi* and insects to wbose assaults it may be subject.

We propose, at an early day, to give an illustrated description of the difference hetween the proper and improper planting of wheat.

The wheat harvest is in progress, and tbe yield thus far exceeds the general anticipation of grain growers. Chinamen are heing extensively employed in the barvest fields. There appears to be no espeoial objection to their employment in that pursuit, as witbout them it would be almost or quite impossihle to save the crops.

Agricultural Items in Brief.

Old Hay.—A farmer at West Dover, Vt., has been feeding out hay that has heen in his harn for thirty-four years. It came out hright and sound, the cattle ate it well, and it was as good in every respect as hay grown laet snmmer.

Rivers Falling.—The Sacramento, Feather, San Joaquin, and Tuolumne rivers are rapidly falling, and farmere will do well to hurry up their grain and send it to market quickly.

Peas.—There are over 2,000 varieties of peas, hut only seventy or eigbty that are considered truly valuahle.

Figs in Ohio.—A gentleman of Chillicothe, Ohio, has successfully cultivated figs in his garden for several years. He says that wherever the tomato can he grown, the fig will flourieh and matnre.

How to Increase the Corn Crop.—A Western writer eays if as much attention was paid to improving corn as is given to grapes, 100,000,000 busbels might he added to the annual crop.

The Rice Crop in the Southern States will exceed that of any season since the year 1860.

Cotton Seed.—Over 4,000 tons of cotton seed have heen consumed the past seasou in Cincinnati, in the manufacturo of oil.

Cruelty to Animals.—The most inhuman cruelty is habitually practiced in the transportation of animals by railroad. Fifty-four animals were lately found hy the meat inspector, dead in an air-tight car, at the Morris and Essex depot, in Newark, N. J.

Poisonous Clover.—Many cattle in Iowa have been killed by eating too freely of clover, wbich has become poisonous hy growing too rank since the recent heavy rains.

California Wool Product.—It is estimated that the wool production of California, this year, will amouut to ahout eighteen milliou pounds—9,000 tone.

Better than Gold Mining.—Ivy Bro's crop of harley, near Salinas City, has turned out sixty-three bushels to the acre. Mr. Withers, in the same neighhorhood, hae obtained an average of eighty-two bushels. Five bundred acres, farmed by Mr. Whitesides, have averaged over eighty bushels, and the adjoining land farmed hy Mr. Pomeroy, yielded ahout the same. The ahove are all upland crops, on the Suscol and Alisal ranchee, and have all been threshed out. The lowlands, where tbe crops are later, have not yet come in; but the yield expected from them is 115 bushels to the acre We glean the ahove from the Castroville *Argus;* and they are facts which muet astonish our Eastern readers.

Shipping Grain in Bulk.—An indispensable condition to the complete succees of the Vallejo elevator, will be the possibility of successfully shipping grain in bulk around Cape Horn. It is understood that this experiment will be thoroughly tested the present seasou. Every dollar saved in this manner will go to enrich the State; hence the result of this experiment will be looked for with much intereet.

Variety in Farming.—One of the consequences of the completion of the Pacific Railroad, will he the opening up of an immense demand for general agricultnral produce throughout all the country helow the Sierras and Rocky mountains. This new demand will tend to the introduction of a greater variety in the farming of California. Anything that will turn the attention of our farmers from wheat, and divide the risks of this industry, will be of great value to the State.

The Foot Hills.—Extensive experiments during the past few years have demonstrated that a large portion of the really very valuable laud in the State is to be found in the greatly neglected foot hills. The choice of the Japan Tea Company, the great success which has attended varions mountain vinyards, and several other like experiments, is fast changing public opinion in this regard.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, July 24, 1869.

Financial.

In the midst of an active demand for money, caused by the prosecution of improvements on an extensive scale, the requirement for funds to move the crops, the construction of new railroad facilities, and the large amount of unliquidated claims against interior dealers, the market is devoid of any tightness and works quite smoothly, considering the stringency prevailing for nearly three months. Rates, in bank, are 1@1¼, and outside, 1½@2 per cent. per month. Bullion is scarce and in demand; we quote gold bars at 870@880; silver bars remain at par; currency bills on Atlantic cities pay 33 per cent. premium on gold, a decline of 1½@1¾ per cent. since our last.

The Marysville Savings Bank opened for business on the 17th of April last, and on the 13th of July the following report was made: Amount of deposits received, $15,177 95; deposits withdrawn, $1,556 85; entrance fees received, $104; loans made, $13,850; loans returned, $500; interest received, $171 25; organizing and other expenses, $342; number of depositors, 52; borrowers, 9.

City Stocks.

In shares, other than mining, we note a very limited business. San Francisco Gas stock realized $83; Spring Valley Water, $63 75; and California Steam Navigation Co., 58 per cent. Of our Savings Institutions, the French society reports as due depositors on the 30th of June, $3,650,847; Savings and Loan, $5,053,543; Odd Fellows', $889,933; and California Building and Savings Bank, (on May 1st) $716,060. At the close, we note sales of North Beach and Mission Railroad at $70, and 20 shares of Omnibus Railroad at $70 per share; also $6,000 S. F. Bonds, 7s, at 89¼.

The returns of our local insurance companies to the Internal Revenue department for the month of June and previously this year have been as follows, upon a currency basis of 74 cents on the dollar for the month of January, 77½ cents for February and March, 75½ cents for April, 73½ cents for May, and 74½ cents for June:

	June.	Previously this year.	Total.
Pacific	$123,624	$492,657	$616,281
Union	32,224	225,758	257,982
Fireman's Fund	36,159	163,397	199,556
California	9,230	52,659	61,889
Merchants' Mutual Marine	27,232	131,534	158,766
Occidental	25,205	110,987	136,192
Home Mutual	15,453	66,797	82,250
Peoples'	20,355	77,596	97,951
Total	$289,482	$1,321,205	$1,610,687
Same time in 1868	167,031	826,624	993,655
Increase in 1869	$122,451	$494,581	$617,032

The above statement shows a decrease of $1,636 from the receipts in May. The receipts of the several companies in June as compared with May show the following difference:

	Increase.	Decrease.
Pacific	$14,491	.....
Union	.....	9,657
Fireman's Fund	.....	11,321
California	.....	218
Merchants' Mutual Marine	.....	1,142
Occidental	.....	377
Home Mutual	3,195	.....
People's	3,460	.....

The receipts of the city railroads for the month of June and previously this year were as follows:

	June.	Previously this year.	Total.
Omnibus	$28,558	$120,362	$145,920
North Beach & Mission	23,491	116,822	140,313
Central	17,093	79,887	96,980
Front Street, Mission & Ocean	9,615	44,686	54,301
Market Street	12,198	57,781	69,979
Potrero and Bay View	9,702	14,127	17,829
Totals	$91,655	$433,665	$525,320
Same time in 1868	86,952	378,823	465,775
Increase in 1869	$4,703	$54,842	$59,545

As compared with the total receipts in May, we find a decrease of $10,946. The receipts of June as against May show the following difference:

	Increase.	Decrease.
Omnibus	.....	$1,838.
North Beach and Mission	.....	3,343
Central	.....	2,069
Front Street, Mission and Ocean	.....	1,034
Market Street	.....	2,402
Potrero and Bay View	.....	652

Mining Share Market.

During the past week, the mining share market exhibited considerable activity, though prices of leading stocks show a decline under quite heavy sales; this may be remarked of Chollar-Potosi, Hale & Norcross, Ophir, Savage, and Yellow Jacket. Of White Pine stocks, the offerings are on the increase, as well in the sale of shares as in companies placed on the list.

GOULD & CURRY—was in the market to a limited extent, at a decline. For the week closing July 19th, 284 tons of ore were extracted, 323 delivered for reduction, and 256 tons remained on the dump at the mine. The shaft was cleared of water on the 18th, and work was resumed on the seventh station on the same day. The second station drift has been opend 500 feet, leaving 350 feet more to clear out.

HALE & NORCROSS—had a sharp fall, under quite large sales. The information regarding this claim is meagre. During the month of June, so far as reported, the hullion receipts aggregate $120,500, and with the returns in April and May, foot up $387,046 for the second quarter of the current year.

CHOLLAR-POTOSI—was largely dealt in since our previous reference, at a small recession, but at the close had partly recovered. A telegram of the 21st states that "the loss by the fire this morning is confined almost exclusively to the Company's buildings, and the lumber and timber, and will amount to considerably over $100,000; insured for $40,000. There was no pay ore being taken out of the shaft where the fire occurred; so there will be no interruption in the ore yield of the mine." During the week ending July 16th, 1,798 tons of ore were extracted, and 1,630 tons were forwarded to the mills for reduction. On the 20th inst., $23,303 in hullion was sent to the office in this city.

YELLOW JACKET—has also met with more activity, selling at a slight decline. In the absence of official data, we have estimated the bullion product of this Company, for the first six months of the current year, at $680,000. An assessment of $10 per share was levied on the 19th inst. At the recent annual election, John B. Winters was elected President; T. C. Taylor, Vice-President; Trustees—J. B. Winters, T. C. Taylor, William Sharon, D. Driscoll, and J. B. Storer. They voted $25,000 in aid of the sufferers by the late fire in this and adjoining mines.

OPHIR—sold to a considerable extent. On the 20th inst., the drift was 451 feet in length, and the material latterly passed through is represented to show traces of metal....IMPERIAL met with small sales. The retimbering of the shaft is progressing well; otherwise nothing special.

The annexed tabular statement of hullion receipts, assessments and dividends, together with the highest and lowest prices of the stock of the various Comstock claims, explains itself. The product of the Yellow Jacket and Occidental companies we have estimated:

COMPANY.	Highest Price.	Lowest Price.	Bullion.	Assessments.	Dividends.

" 1866	4,926,708	526,000	687,400

* Estimated.

THE MINING AND SCIENTIFIC PRESS, the only journal west of the Mississippi river devoted to mechanics, mining and the physical sciences, has just entered upon its nineteenth volume. It is the most valuable publication to California miners, inventors and scientists published on the coast, and another department has been added devoted to Agriculture, which will render it an excellent family paper for country folk. The PRESS is a very handsome 16-page sheet, ably edited, compilations and selections made with care, and contains all the latest discoveries of interest in the arts and sciences with finely engraved illustrations. Published at San Francisco by Dewey & Co., Patent Agents.—*Vallejo Chronicle.*

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

"TO BE WEAK IS TO BE MISERABLE."—No matter by what cause the physical energies may have been impaired—whether the frame has been debilitated by over-exertion, or anxiety, or excess—DRAKE'S PLANTATION BITTERS will restore the staminal vigor of the system when all the prescriptions of the pharmacopœia have utterly failed. This is a great medical fact, resting upon volumes of published testimony, and it cannot be controverted. Remember that decay is progressive—that chronic debility, unless checked by proper treatment, increases from day to day, and inevitably shortens life. Change the condition of the vital organization with this powerful vegetable alterative—it imparts motive power to the inert animal machinery; bracing up the nerves, the body servants of the brain, and endowing the stomach with the healthful activity requisite to convert the daily food into a life-sustaining element. "To be weak is to be miserable," says Milton. The blind poet was right. ***

THE best place to get every different variety of spectacles to be found in the market is at C. Muller's, 205 Montgomery street, near Bush. ***

AMERICA ON HER TRAVELS.—It is estimated that there are not less than 300,000 Americans making the tour of Europe, or temporarily sojourning there.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine. *

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Leviathan.—*Miner*, July 10th: We learn from Mr. Wolf, foreman, that permanent operations will commence next Monday. The movement is eustained by London capital, and it is believed there will be no "let up" until the mine is thoronghly developed.

Imperial looks enconraging....M. C. M. Will soon be ahle to treat ores of low grade with profit, it is thonght....Globe still in quartoze rock with water coming in.

Barnes' Claim.—*Chronicle*, Jnly 10th: This—the Old Billy Rodgers' Claim—is promising. The shaft is down 135 feet, at which depth a drift is heing run across the ledge. They are in fifteen feet. The ore looks well, and Barnes has in contemplation the erection of a mill.

Morning Star.—Supt. Gamble is taking out ore, and getting along finely. George H. Ensign, the new President, will come from San Francisco next week to examine the mine.

MARIPOSA COUNTY.

Hite's Mill and Mine.—Correspondence of the *Mail*, July 16th: Hite's Cove is 22 miles from Mariposa. The new mill is thought to he ahove any high water that may come. Twenty stamps are grinding on an average 15 tons every 24 honrs. Four of Knox's pans amalgamate the free gold; then follow two tanks for amalgam and snlphurets; thence the pulp passes into "Eureka" pans, where it is reground; then into a large settler. Blankets are the last means nsed helow everything else for saving the sulphnrets. The remaining sands are heaped up with salt and exposed to the weather for several months. A regrinding then secures nearly all the gold. The last assay of these sands showed $548 per ton.

NEVADA COUNTY.

Grass Valley.—*Union*, 14th: The Enreka yesterday had gold bricks which weighed altogether, 1,160 onnces, and were sent below.

From New York hill there has heen a crushing of 23 loads which yielded about $500 in coin. Ben. Macauley's mill did this last.

The Idaho mine, for a two weeks run, sent below yesterday morning, bricks valued at $14,000.

Blasting Experiments.—Same of 18th, Yesterday, at the Empire, some experiments were tried in hlasting with the qnality of gunpowder, knowu as rifle powder. This was put np in cartridges and rammed down in the holc made by a three-qnarter inch drill, and threw out the rock well. The experiments will he continned. An agent of one of the powder companies of San Francisco, is conducting the experiments. We nnderstand that gun cotton, of improved manufacture, will soon arrive here from Europe, and will he tested in our mines.

Banner Mine.—*National*, July 13th: We learn that this mine started this morning on the old hasis, with black powder and double-handed drills.

Call for Machinery.—The fact that prospecting is active is proved by the fact that there is a great demand for second-hand machinery for hoisting purposes.

Eureka.—This nine had a clean-up Saturday, after a run of ten days, which yielded $22,300. The bricks, which weighed 1,260 ounces, were sent down to San Francisco yesterday.

New York Hill.—At Ben. Macauley's mill, 23 loads of rock from New York Hill have just been crushed, paying over $22 per load.

Idaho Mine.—This mine, after a rnn of two weeks with fifteen stamps, has had a clean-up of $14,000.

Wm Penn.—Same of 15th: The shaft in this mine is snuk to the depth of 160 feet. About 25 fcet more remains to be sunk under the present contract. The rock heing taken out is of such excellent quality that it pays all the expenses of sinking. The ledge is large and well defined.

Combination.—This mine, on the south side of Wolf Creek, has been worked in former years. A tunnel has been run in 150 ft. A contract was let yesterday to continue the same. About 75 ft. more will stril e the ledge.

Steep Hollow.—D. O. Wight, several years ago, run a bed rock tunnel for a gravel channel at the upper end of Steep Hollow. Recently he gave one-fonrth of his ground to Johu F. Coe, who contracted to run 50 ft. for such iuterest. On the 4th of Jnly Coe raised up two feet at the head of the tunnel and strnck gravel which yielded a dollar to the pan. From half a car load that was taken ont, $18 was realized.

At the Cascades.—16th: The Burrington Hill Mining Co. have heen washing during the season and are doing first rate. They are now cleaning np and will he at it several weeks. So far the returns are good.

Mining Patent.—The Allison Ranch Co. are applying for a patent to their mine.

Mines at Eureka.—The Forest Rose Co. have been running for their ledge for some time, and have every prospect of striking it shortly. They have recently struck a large stringer, the rock from which is rich in free gold.

The Jim Crack or Erie commenced work on Monday, Mr. Veatch having the charge. He intends taking out 200 tons of rock to he worked at Black & Young's mill.

The Birchville mine has heen paying regnlar monthly dividends since December. Their 5-stamp mill is kept running, and the yield of the rock is excellent.

Banner.—*Gazette*, 14th: There was a rumor yesterday that the Banner Company had discharged all their hands, and hired again those who strnck some weeks ago against the giant powder. A gentleman who was at the mine last evening tells us there is no truth in the report.

PLUMAS COUNTY.

Argentina, Again.—Qninicy *National*, July 10th: Last week we stated that we helieved this to be the richest in the State. During the week we have visited the locality. The company have run an open cut into the vein, about 40 feet deep. The rock is yellowish, not mnch harder than clay, with small seams of scraggy quartz here and there. The gold is not so much in the quartz as in the seams and rock around it. The mine is now demonstrated to be 1,000 feet in length, with a breadth of 200 or 300 feet, and in every part of it fine gold can he seen. The company have quit slnicing, believing that they were wasting more gold than they were saving. Killey & Archer have run a cut into the same vein, 600 feet from Heath & Co's, where the mine looks the same and pays as well.

Rich Gulch.—The scarcity of water has been a drawhack. Those who had water have done well. Capt. Corser's claim, with a small head of water, has averaged for the last three months, $8 per day to the hand. McNeely & Co. have a rich claim, but have not had sufficient water to make any headway. At 12-Mile Bar none of the companies have cleaned up yet. Their claims are looking well.

Sawpit Flat.—The miners have abont finished cleaning up. Their claims have generally paid.

SIERRA COUNTY.

Quartz Discovery.—*Messenger*, July 17th: A gold hearing ledge has heen discovered in the neighborhood of Port Wine, and abont 200 ft. located. The croppings assay $22 per ton.

Rumored Sold.—It is rumored that the Kanaka Quartz mine has heen sold to a company of capitalists who will open and develop it.

Iron Mine.—A qnantity of ore from the San Sahra irou mines near Gold Lake, has been sent below to be tested.

SISKIYOU COUNTY.

Joint Stock Company.—Yreka *Union*, July 17th: We understaud that Mr. James Trimhle and others of Oro Fino and vicinity, are taking steps to form a joint stock company for quartz mining. Trimble & Co. owu a valuable quartz ledge, on which they are erecting a mill. They propose to form a company, with $50,000 stock, divided into 1,000 shares; to work this and other ledges in the vicinity.

Mining at Oro Fino.—All mining at Oro Fino has been suspended for the seasou, on account of the failure of water. But little will be done there again before next February or March.

TRINITY COUNTY.

Cox's Bar.—*Journal*, 17th: Sid. Cnne has sold his mining claim and ditch to William Wilshire and William McElvany. Amos T. Smith has leased his claims, water and rauch, to Thos. Cox, for three years.

The New Diggings.—McCollum & Co. are doing well on Franklin (Sawmill) creek, findiug gold in pieces from one to three dollars. Thos. Price has been getting from $5 to $21 to the pan. He picked up on the hedrock $100 in oue day, in pieces of two, four and five dollars.

Stewart's Fork Ditch.—A party of men who have heen examining the ground, report favorably, aud state that the line is located upou good ditching ground, aud that there need not be more than one-half mile of flume. We are informed that parties now in town will perhaps proceed to organize a company to build this ditch.

Arizona.

Independence Lode.—Prescott *Miner*, July 3d: A. L. Molitor has shown us some rock from the Independence which will pay at least $30 or $40 per ton in free gold.

Walker's District.—The creek and tribntary gulches heing almost dry, placer miners can do nothing until water comes.

Lower Lynx Creek.—The Bashford Co's ten men are hard at work upon their ditches, etc. Jackson, Lovejoy & Co. are fixing np.

Hassayampa.—Yonng & Scott, in the cañon helow the month of Copper creek, did not find very good pay. Stone & Vincent worked a har above the cañon, and we have heen told averaged $10 a day each.

Sterling.—Work is progressing. It is helieved that the new mill will he completed in a month.

Chase.—Work will soon he resnmed. Recent letters from Paul to Noyes point ont the canse of failure of the new process at the first trial.

Wickenburg.—A recent letter states that the new battery of Reese & Krause worked defectively....A man has arrived from the new diggings near Walnut Grove, having in his possession several hundred dollars which he dug out there....The Vulture mill was running.

Colorado.

Briggs Mine.—Central City *Herald*, Jnne 3d: Mr. Beech deposited at Warren, Hussey & Co's bank to-day a retort which weighed 404 ozs. 11 dwt., worth $9.000. It is the product of three weeks' run on the poorest ore in the Briggs mine. Thirty-five tons of ore, worth $100 per ton, have been selected for Prof. Hill, which makes the gross product of the mine for three weeks $12,500. The work has been interrupted during the past month by break downs and repairing.

We saw a chunk of gold this evening which weighed 23 ounces 5 dwt., which came from one cord of ore taken from a new discovery in Peck Gulch.

Pewabic.—One cord of surface qnartz from Perrin's claim on the Pewahic lode, run in Bradley's new mill, Russell Gulch, yielded 43 ounces gold, worth $23 per ounce, or $989 currency.

Gold Shipments.—Same, July 12th: The shipments made by the three bankers of Central City from January 1st to July 1st, 1869—a period of six months—at currency valuation, amount to $863,000. For the same time last year, $752,000. Increase, about $110,000. The shipment for June is less than it wonld have heen hut for the trouble about water in the mines. This will probahly not interfere with the working of the mines during the succeeding months of the year. We therefore anticipate a much larger increase in the amount of gold produced for the last half of this year than the above figures show for the first. We give nothing in this report but accurate figures, and therefore leave ont the shipmente of silver and Prof. Hill's shipment, which we may put down at $150,000 for the six months.

Oro City.—Denver *News*, July 14th: Mining operations going on smoothly. The owners of the Pilot lode last week began working the decomposed ore by the puddling process. The first cord and a half yielded 42 ounces of gold. The mine looks as well as ever. Capt. McCannon is still prospecting his new diggings, and although he has not yet reached "bed rock," he thinks his prospects are good.

Central City.—*Register:* Three and a half cords of ore from the Jones lode, Nevada, jnst run, yielded $1,761.86. One cord of galena ore from the same lode yielded under stamps 13 ounces gold bullion. This is something rare, as galena seldom yields gold.

Idaho.

Silver City *Wave*, July 13th: The Cosmos mill will start up on Silver Cord ore about Thursday morning.

The brick mentioned by us as the product of two tons of Sherman ore in Flint, weighing 452 onuces, assayed $9.36 iu gold and $528.64 in silver—$538—being $269 per ton.

Bed Rock Mining Project.—Idaho City *World*, July 15th: The meeting held in this city in connection with the project to sink a shaft to bed rock to test whether it will pay to mine, has led to fair success. Through the exertion of the Finance Committee about $1,000 has been contribnted, and it is estimated that the work will cost $2,500. A stock company has heen orgauized to prosecute the enterprise.

Bullion.—From Mr. DuRell, Manager of the Agency iu this city of the First National Bank of Idaho, we learn that the treasnre shipment to New York for June summed up $112,448.88 currency. We may he sure that the amounts forwarded to San Francisco by Wells, Fargo & Co., Greathouse Bros., and private hands, would swell the total shipment to fully half a million dollars. Boise Basin is still rich in gold.

Montana.

Phillipsburgh.—*New Northwest*, July 9th: The Hot Spring Co. strnck the main ledge Thursday, and are now sinking a 5x10 foot shaft through it. An assay just made showed over $1,100 per ton—picked rock, however. Purvine, Ulery, Dennan and Heal, have snceeeded in turning Flint Creek from its channel through a ditch ten feet wide and three deep. Keep & Bear are making preparations to sink on the Salmon lode—will commence on Monday. The St. Lonis Co. announce their intention of starting np the mill abont the first of August, and will run it as a custom mill. They already have about 300 tons of beautifnl ore from their own mine on hand.

Boulder.—There is a general scarcity of water in Boulder as well as everwhere else. Work is suspended at Alta Gulch, and claims laid over till May 1st, 1870. At the Old Humhug diggings, ten miles above, one pipe and several ground sluices are still running.

Blackfoot.—Our correspondent informs us that there is only 300 inches of water in Tiger and Ohio ditches. Not over 100 men mining at Blackfoot and Carpenter'e Bar. Some rich ground has been struck at the head of Prairie gulch, and near Washington Gulch, but no details are given.

Highland.—Prof. Swallow is now on the leads of the Highland Gold Co., and intends to start up the mill soon. The arastras are ruuning on Only Chance rock and are cleaning np about $1,000 per week.

Nevada.

COPE DISTRICT.

Elko *Independent*, July 14th: A Monntain City correspondent, an experienced miner, writes us, 10th: "The mines of this district are richer than the most sanguine anticipated. The ledges are looking finely, and the ore improves in quality as depth is attained. The richness of the mines is now estahlished heyond a doubt, and no fears are entertained of their permanency, as the ledges are found to be regular and well defined. Several discoveries have been made, among which may be mentioned the Hamilton, a vein of very rich ore full two feet wide."

Rich Ores from Cope.—We received last evening, from friends in Mountain City, specimens of ore from the Blue Bell, Fuller, Estella, Mammoth and Great Eastern mines, which compare favorably with the best ores of the richest silver mines in the State. Some of the specimens contain native silver.

More Ore from Cope.—Same of 17th: On Thursday, Col. Drew arrived with a lot of ore, which he intends to ship by rail for reduction. This ore is from the California, and when its yield is made public, it will effectually stop croakers.

Cedar Pass.—New discoveries in the vicinity of Cedar Pass are attracting attention. The ledges are large and well-defined, ranging from 5 to 20 fcet. Samples of the croppings have been assayed in this town which yielded $53 per ton in silver and $3 per ton in gold.

Col. Frank Drew has shown the *Territorial Enterprise* the result of the working of three tons of ore from the Magenta. It went $9.30 in gold and $470.60 in silver. The Col. started hack to Cope last evening.

Excitement.—A telegram, dated Elko, 20th, is as follows: "Parties are leaving daily for Cope, taking with them tools, provisions, etc., for the purpose of locating and developing. One lot of rock from the Argenta mine, assayed at this place, showed $2,900 to the ton. Another from the California assayed $2,700."

HUMBOLDT.

Unionville.—Grass Valley *National*, July 16th: Mr. J. D. Jennings, who is largely interested in mining in Unionville, Nevada, is now on a visit to Grass Valley to purchase machinery. He gives a flattering account of a numher of silver ledges, including one owned by J. C. Fall, the Stewart, Alpha, and the National series. Rock from the Fall ledge prospects from $20 to $4,000 per ton. Near Star City excellent gold diggings have been discovered, and miners are making from $15 to $20 per day to the hand.

Quit Work.—Elko *Independent*, 14th: A correspondent writiug from Unionville, Tuesday, says: "Fall has just returned from San Francisco, and ordered that miners shall work ten hours, instead of nine. This the miners refuse to do, and have

quit work. Stewart, of the Silver Mining Co., has gone to the mines to get his men to add an hour to their labors. This move is made by the mine owners in order to introduce Chinese, as they know the miners will not work ten hours. They can say white men will not work for them, and they are compelled to employ coolies. The whole move was put up with this in view. I am of the opinion that this will prove a very warm climate for Chinamen yet."

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

PROSPECTS.—Gold Hill *News*, July 16th: The principal cause of the depression in mining stocks is the condition of the Crown Point, Kentuck and Yellow Jacket mines, owing to the still-existing fire. No ore is produceable from the Crown Point, and comparatively little from the Kentuck. The Yellow Jacket is improving, owing to the increased circulation of air, but in those three mines hundreds of men are thrown out of employment, and the production of ore is absolutely nothing to what it used to be. Looking ahead, say four months, we can see a vast improvement.

YELLOW JACKET.—July 17th: More men at work, and 200 tons extracted daily. Nothing new in Crown Point or Kentuck, except that measures are being taken to work the lower portion beneath the fire, through the 900-foot level of the Yellow Jacket.

HALE & NORCROSS.—Lower level looks as well as ever. Yield is over 100 tons daily. South drift develops a fine streak of ore five or six feet wide, assaying nearly $60 per ton.

GOULD & CURRY.—Shaft repaired—water out by to-morrow. Upper levels yield 50 tons daily, assaying $50 per ton.

SIERRA NEVADA.—First clean-up for the month made yesterday—comes up to the average. Everything prosperous.

SAVAGE.—Nothing new. Receipts $20,000 *less* than two millions, and disbursements, including dividend, $35,000 *over* two millions. Cash on hand July 1st, $47,000.

CHOLLAR-POTOSI.—Yields 250 tons daily, mostly from the Blue Wing. Profits of the year, $236,000. Cash on hand June 1st, $168,000.

VIRGINIA CONSOLIDATED.—New shaft 136 feet deep to-day.

IMPERIAL-EMPIRE.—Upper levels still yield ore, but will be worked out in a few months. Extensive repairs required. Assessment of $5.

YELLOW JACKET NORTH WORKS.—*Enterprise*, 15th: The repairs to the shaft are not yet concluded; therefore the hoisting of that 300 feet of water has not commenced. The big tubs and all the apparatus for discharging the same are in readiness. The building itself is being altered to suit, and the aspect of everything is materially changing.

CHOLLAR-POTOSI.—The shares in this company have been increased to ten times their former number, so that the present quotation of the stock at $30 per share or thereabouts, is just equivalent to the former one of $300.

VIRGINIA TELEGRAMS.—19th: The bullion shipment by Wells, Fargo & Co., on the 17th, was eight bars, 559 pounds, valued at $11,505.37½; by Pacific Union, twelve bars, valued at $10,704.85. Total, $22,210.22.

There are rumors of a strike in one or more of our mines, but I am unable to trace the rumor to a reliable source.

The Yellow Jacket Co. voted $2,500 for the sufferers by the fire in their mines, and levied an assessment of $10 per share to cover it and other expenses growing out of it.

Delinquent stock in the Kentuck mine will be sold August 3d.

WHITE PINE.

THE STRIKE.—The *News* thinks the reduction of wages was an unkind move for the Eberhardt to make, because it could better afford than any other company to pay the old price. In its issue of the 12th, it says: "Our own theory is, that the reduction of wages is a job put up to bear White Pine in the stock market. Eberhardt is not in the market—the fortunate owners have none to sell—but has come to be regarded as the representative mine, the others to be more or less affected by its reputation. To get the word abroad that the Eberhardt has put down wages of workmen because the rock will not pay, is to put Hidden Treasure, Pocotillo, Chloride Flat, and the other stocks, down."

Some of the leading mines are still idle. Others have reduced their working force. The contract system,—says the Mining Review of the *News* for the week ending 17th,—will probably supersede that of wages altogether. The Eberhardt has let a contract to have 20 tons of ore extracted per day. Several other companies have also let contracts; and in some cases the pay will amount to less than $4 per day to the miners. The mines look more promising than ever. The *News* advises all those who have the blues, owing to the new break, to go and look at them. We quote: "The Empire and Grattan shipping their first bullion to-day; the Evening Star Consolidated, Blair and Banner State, Excelsior, Sam Slick, and others, sending their first ore to mill; the Star and Stewart, Old Ned, Guardian, Paris, Chester, Hemlock, Olive, Oswego and others, piling up their first-found ore and enlarging their dumps to receive it; then take a glance at the ore breasts of the Consolidated Chloride, the two Auroras, Pogonip and Othello; go down into the Mazeppa and see the glittering wealth there; examine the great masses of rich chloride, and horn silver in the Original Hidden Treasure, and for the pure stuff see the little Posthole; go look at the rich mass of ore recently unearthed in the Pocotillo, the mountain of chloride bored by the tunnel, shafts and drifts of the Virginia, the fine ledge struck by the Noonday, 90 feet down, and a hundred other recent developments which promise returns for well-directed labor and capital. White Pine promised well four months ago—its inestimable wealth is now in sight, and tangible."

BULLION.—We have no returns of bullion shipped for Saturday and Sunday last, nor for yesterday, and therefore foot up the four intervening days at $46,701.23, being $13,597.96 less than the shipment of last week.

MILLS AND SMELTING WORKS.—John Tregloan has gone to Forest Hill, Placer County, Cal., to pack up and ship for White Pine a 10-stamp mill, of which he is part owner there.....The Treasure mill (Big Smoky) is being changed to a dry crusher. Will be completed by Thursday.....Mosheimer's Smelting Works will be in full blast this week....*Telegram* of 16th says: Logan & Co's mill at Swansea will commence active operations on Monday next.

OUTSIDE DISTRICTS.—The *Telegram* has seen some ore from Reveille district which is covered with horn silver. An average specimen assayed $2,900 per ton....Twelve or 15 men are at work in Tem Piute.... Accounts from Patterson are cheering. Mills are wanted. The *Empire* of 17th hears of men who have returned from there with large samples of excellent ore, which will run into the $400 to the ton, who are desirous to give half of two good ledges and 400 tons of ore on the dump, to any capitalist who will erect a mill in the vicinity of their claims. A Mr. Garnish is negotiating for a mill near Austin, to be removed to Patterson district. Three more loads of the machinery for Martin & Davidson's mill, also for Patterson, are expected to arrive to-day from Elko. A ten-stamp mill for Patterson has already passed through Hamilton.....Highland is a new district 150 miles south of Treasure City. Material is on the way,—says the *News* of the 17th,—for furnaces to be constructed there.

ITEMS.—*News*, 12th: The Excelsior had a ton and a half of ore crushed on Saturday which yielded $102 per ton.....13th: Workmen in the Boohinger slate quarry, on Union street, struck quartz below the slate yesterday afternoon, containing rich chloride ore.....On Mount Ophir the Buena Vista has shipped ore to mill, that went $1,222 to the ton. The Caroline has tracked chloride 1,000 feet, all the way. Several other claims have got fine ore.....14th: Rich strike in Pogonip and Othello, north shaft.... 15th: Pocotillo has 40 tons first-class ore on the dump.....16th: The Ophir beyond Babylon, on the Base Metal Range, is developing finely.....Edward Applegarth, of the Eberhardt, has purchased the Mazeppa mine entire, and will start work in it on Monday, with three 8-hour shifts of miners.....*Empire*, 15th: Argument in the case of the Aurora Consolidated and Earl closed last night. Decision reserved until Monday....*Telegram*, 12th: Southern Slope tunnel is now 80 feet in length. Indications good for metal in 15 or 20 feet.

New Mexico.

PINOS ALTOS.—San Diego *Union*, June 30th: The mines at Pinos Altos have stopped work. It is alleged that the suspension is made for the purpose of freezing out a few small stockholders. The mines are very rich, and are located on the route of the proposed Southern Pacific Railroad —32d parallel.

The Anderson and Stone mines, at Apache Pass, have all the machinery up and ready for work but have not started as yet, owing to the scarcity of funds to pay the expenses of running. We saw the agent a few days since on his way out with the money, so that we may expect to hear good news from these mines, shortly.

MORENO.—*Lantern*: Maxwell's mill in two days' run produced 116 ounces....The amount of gold shipped since the 1st of June by express, private parties, etc., will foot up at least 500 ounces per week..... Assays made by Prof. T. G. Rounds, from the Swansea lode, returned $430 in gold per ton. He selected the ore from a shaft but 12 feet deep.

Oregon.

RICH STRIKE.—Jacksonville *Sentinel*, July 10th: The owners of the Malachi quartz ledge on Lightning Gulch, in Josephine County, have struck rich pay.

MINING AT STEAMBOAT CITY.—We learn that the ditch of Sturgis, Titus & Co., is finished. There is 200 inches of water in it, taken from the right hand fork of Appleton Creek. The ditch is 5¼ miles long. The claims compriso 800 yards of the gulch below Steamboat ledge, and are probably the richest in the county. On main Applegate, Harriot's river claim is paying well, pieces weighing from ten to fifteen dollars being frequently found. Epperson & Herbold are getting good prospects. A Chinese company are putting in a wing dam below.

Wyoming.

SWEETWATER MINES.—*State Capital Reporter*, July 16th: Z. Swaringer, has just returned from the Sweetwater mines. There are 3,000 people in the district. The ledges are extensive and well defined. The principal lodes are the Miner's Delight and Mineral Star. Thirty-six tons of ore from the former, at mill yielded an average of $56 per ton, and several hundred tons from the latter gave an average of $45. Five mills are now in operation, and six more will be completed before the close of the season. These are being erected by Eastern capitalists. The principal placer mines are on Rock Creek. They proved a partial failure last season but are now being worked with success. A stratum of gravel has been struck beneath what was thought to be the bedrock, which pays half an ounce a day to the man.

A NEW INDUSTRY — CALIFORNIA CAR WHEELS.—After experimenting for a number of weeks at the foundry of the Sacramento Valley Railroad works, says the Folsom *Telegraph*, car wheels equal in all respects to those sent from the East are being made, and six wheels are now being cast daily at a less cost than they can be procured elsewhere. There is every reason to believe that in a very short time all the wheels required for use on this coast will be cast here, thus opening a new branch of mechanical industry in this State. There is nothing like enterprise and energy when rightly directed. Millions almost have been sent from this State to the East, which by properly directed efforts might have been retained here.

THE EAST RIVER BRIDGE,—soon to join the city of New York and Brooklyn,—will form a gentle arch, with a span of 1,600 feet, and in the center will be a clear hight of 135 feet above low water. The largest ships must strike their top-gallant spars to pass under, but all others will find space and to spare. The survey for the structure has been completed, and the materials are being prepared for the abutments on the river shore.

A WHOLESOME RAILROAD LAW.—A law of Ohio enacts that each railroad in the State shall, when necessary to heat any of its cars, do so by heating apparatus so constructed that the fire in it will be immediately extinguished whenever the cars are thrown from the track and overturned. The same law provides that the cars shall be lighted by candles only.

THE FUTURE REPUBLIC.—When our country shall be as densely populated as Massachusetts is to-day, we shall number a population of 600,000,000, and when it reaches Great Britain in point of density, our population will number more than 860,000,000.

A GREAT CONFLAGRATION.—The great conflagration produced by the burning of the overflow of the oil springs near the Caspian Sea, is said to have extended over a surface 700 miles long by 200 wide. Nearly all the fish in the sea were destroyed, and a great destruction was caused to vegetation for miles around the shores.

Peter Funk.

This well known New York public functionary sends us an advertisement of his business, in the most unexceptionable business style, and under the substantial looking names of "Stewart, Hall & Co., No. 193 Broadway," office of the "Empire Gift Company." Peter (who is an ex-special policeman and quite a politician) announces inducements to the financially hopeful as follows:

"A chance to draw any of the above prizes (pianos, sewing machines, watches, etc.) for 25 cents. Tickets describing prizes sealed in envelopes and well mixed. On receipt of 25 cents a sealed ticket is drawn without choice, and sent by mail to any address. The prize named upon it will be delivered to the ticket-holder on payment of one dollar. You will know what your prize is before you pay for it. Any prize exchanged for another of same value. Satisfaction guaranteed. Six tickets for $1; 13 for $2; 35 for $5; 110 for $15."

Here is an opportunity to try the interesting experiment of putting twenty-five cents through a hole.

CATCHING WHALES BY ELECTRICITY.—*The Engineer* says that H. J. Rogers has submitted a proposal for this to the Society of Civil and Mechanical Engineers. Practical whalemen seem, it is said, to think favorably of it. "A galvanic battery is placed in the whaling boat with a powerful induction coil in communication. From the terminals of the battery two insulated wires pass as conductors, through a line of the size ordinarily used to the harpoon, which is made with two heads, separated from each other, each insulated wire passing through the harpoon to the points where they terminate. The handle of the harpoon is of course insulated. In this harpoon the circuit would be complete when it struck the whale. According to another plan, one insulated wire passes from one terminal through the rope to the end of a harpoon having one point only, the other insulated wire hanging in the water, and acting as a means for the return current. The experiments have been tried on eels and other small fish without perforating the skin. The two wires from the poles of the battery being simply directed in close proximity to each other towards the fish, or one wire at the head and the other at the tail, and the effect has been to produce rigidity and complete temporary paralysis, the eel and other fish appearing perfectly lifeless during, and even after the period of contact.

DECIDEDLY FRENCHY.—The Pall Mall *Gazette* says: "The invariable failure which has hitherto attended nautical expeditions to the Arctic regions has induced two Frenchmen, Messieurs Tissandier and de Fouviélle, to undertake the enterprise of reaching the North Pole in a balloon. The machine in which the bold adventurers are about to embark on their perilous journey, and which is appropriately named 'Le Pole Nord,' is now being completed in the Champ de Mars, which the government have placed at their disposal for the purpose.

The monster balloon, beside which even the famous Géant would seem a mere toy, will contain over 10,000 cubic meters of gas, and is composed entirely of a cloth manufactured from caoutchouc, which will allow of great expansion in the rarefied strata of the atmosphere. The seams uniting the different pieces form a total length of three English miles. The car, a marvel, it is said, of strength and lightness, is constructed to carry ten passengers, 4,000 pounds of ballast, and provisions for a month."

ENGLISH VS. AMERICAN SHIPPING.—The people of the Mississippi Valley, who are making such a laudable effort to secure a cheaper transportation for their grain to to Europe *via* New Orleans, instead of Chicago, are obliged to go to England get their ships. Although a portion of the stock will be taken by capitalists in this country, the ships will be mainly owned and entirely run on English account. The high price of labor and stock in this country has done more to break down American shipping, and transfer our foreign carrying trade to English bottoms, than all the raids of rebel cruisers during the war of rebellion.

San Francisco:
Saturday Morning, July 24, 1869.

Notices to Correspondents.

Bacchus.—Fusel oil is scientifically known under the name of *amylic alcohol*. In some form or condition it affords all the flavors of various spirits, be they called whiskies, brandies, arrack, or any other names. *Amylic alcohol*, or fusel oil, is an antiseptic. From experiments it has been found that when its vapor is inhaled, the effect is first to produce irritation of the nostrils, afterwards drowsiness, followed by a kind of coma, but not accompanied by insensibility to pain. This is attended by a peculiar muscular action and rigor, which increases in force under excitement. It has never been found to destroy life. Animals brought to the verge of death, and apparently beyond recovery, soon rally after being placed in the open air.

Blue Nose.—According to a paper written by Mr. G. F. Matthews, and read before the London Geological Society, the rocks exhibited in the southern portion of New Brunswick, resemble very much in character those found in the greater part of Canada and the northwestern portion of the State of New York, namely: I. The Laurentian formation—Portland series; II. Huronian series—Coldbrook group; III. Lower Silurian—St. John's group; IV. Upper Silurian; V. Middle and Upper Devonian; VI. Lower Carboniferous; VII. Carboniferous, with a small surface covered with Trias and modern alluvium.

C. H. A.—You have been reading the article on the Rivot process hastily, and quote it incorrectly, as you will see on re-perusal. A chemical formula, furthermore, is not necessarily, nor usually, an "equation." Its chief object is to state results, the equation mark (=) being merely a convenient form of putting it into type. You suggest that protoxide, not peroxide results, plus some volatile sulphur. In point of fact it is principally peroxide, but there remains some intermediate protoxide. The S could not well pass through fire in the presence of oxygen without becoming SO^2. If you can find errors in the Mining and Scientific Press as often as the *Scientific American*, we will be glad to be reminded.

Bird Fancier, Alameda.—The food of small birds varies much according to season, as respects both qualities and quantities. Insectiverous birds are at some seasons as eager in the pursuit of the larvæ, as of the mature insect; at others, worms and analogous minute reptiles are sought. As a whole, the weight of food consumed by small birds is of an animal rather than a vegetable type. The buds of some trees are occasionally destroyed by the feathered creation, but this happens most frequently in consequence of searching for some more destructive grub that lay concealed under cover of such buds.

G. B. E., from Treasure City.—Received too late for insertion this week. Letters have also been received from correspondents at Gold Run, Nev., Vallejo, Cal., and from Quincy, to which due attention will be given next week.

Capital for Mining.

"Nothing can be done without capital," is the wise conclusion arrived at by many a miner who has had the advantage of experience. But capital does not, in these times and in our midst, adequately appreciate a really meritorious mining property. So much the better for euergetic, practical men, with little or no capital, who do; for a good mine, we know, is now and ever will be, as substantial a thing as coin itself.

After a thoroughly intelligent comprehension of the situation in a mining enterprise, capital to work with is the all-important consideration; but the cart must not go before the horse. The mine-owner should know the ingredients of his ores, or have advice thereupon from such practical expert as can be depended upon, together with the quantity that can be got out at a certain cost, how to choose the most suitable process for beneficiating, etc. To err on these points would wreck not only the owner, but the capital that might come to his aid.

It has best suited a majority of the money-eyed operators of San Francisco to buy and sell rather than to work mines—a method of procedure learned and adopted by them from experience, to some extent, it must be admitted. Failure in procuring dividends in mining is to be taken, however, just for what it is worth. Shrewd business men point to the generally alleged fact that mining, on the whole, swallows up as much capital as it yields. Yet we know how many in our midst have had their start in other business by a success in mining. We ought not, in justice, to reckon with the calculation aught but intelligent and legitimate mining,—so different from mere speculation, or from the wild and imaginative fortune-hunting which charactorizes even capitalists on this one subject, that seems to touch the selfish principle in men so closely as to annihilate their usually governing commercial reasoning.

San Francisco capital has been, up to the time of the inroad of "Chicago flats," an anomalous institution, operating in a peculiar manner; with many features which are attractive and interesting to a student capable of grasping financial subjects. Touching its influences upon mining in Nevada, the Hamilton daily *Inland Empire*, an "emancipated" newspaper, says the following very sharp things:

"So general has been the practice of San Francisco capitalists to "freeze out" small owners, and by means, too, less honorable than is the highwayman's practice of obtaining his fellows' valuables, that now men dread to see these same grabbers obtain a foothold here. The Comstock has furnished a history which it is not pleasant to contemplate; a history which it seems to us no well-wisher of White Pine would care to see repeated here. Without very much capital to start with, a ring of banking operators, in connection with the old "Stock Board" of San Francisco, through a systematized course of "bulling" and "hearings" secured the ownership of almost the entire mother vein of Nevada in their own hands. It is useless to prate of good management on the one hand and want of thrift on the other. There is a general sense of justice in the hearts of men which rebels at such a conclusion. Besides, we are all familiar with the way that unnecessary assessments were formerly levied, of the unnecessary expenses to which all the mines were subjected, until small owners were starved or sold out, and the poor man was obliged to give up for naught his title to a fortune. By this we do not mean to say the money-eyed men of San Francisco are all rascals; we do not mean to say there are no money-eyed men in San Francisco who are honest. But, as regards the treatment of Nevada by these people, we have stated a general rule, which has no more exceptions than other general rules. At the same time we would not recommend our people to eschew San Francisco. There is capital there, which, if it were brought here and expended, would benefit both the rich men there and the poor men here. Our people ought to know by this time what to depend upon when dealing with the men of California. Perhaps we might fare no better with the sharp men of the East in mining transactions. There would, however, be one advantage with the latter which has never been realized with the former. They would bring a large Capital here, and invest their money liberally, and they would place us in direct correspondence with markets that would deal generously with us—and that is more than San Francisco has ever done with its dependent interior. In addition, they would wean our people from a mistaken idea of the value of coin over the general medium of exchange in the East, and thus take us out of the clutches of a San Francisco money ring which can create a financial stringency at pleasure."

Let the fact be remembered by those interested in mining undertakings that this is a field to look to for great gains, for untold profits under a shrewd and intelligent management, which at the same time will insure the systematic capitalist under all circumstances against loss. Let no good business man who has money invest it in a mine until he has had the benefit of the judgment of one or more reliable, practical experts in that business. Let him go over all the points himself when so pointed out to his comprehension.

Capitalists who merely buy and sell do not need such assistance; it is a matter of indifference to them whether the mine is destined to pay well or poorly; whether its yield is to be permanent, or whether its prospects are utterly unreliable. Evidently so long as our practical mining interest looks to this class of capitalists for the means of working and development, there will be mismanagement—much of it, and of the grossest kind; for speculators' interests are not essentially dependent upon the exercise of the best possible judgment, and upon keen practical calculation—upon which alone rests the certainty of mining as an investment.

It is about time that mine-owners and managers should possess a little judgment on these subjects; should learn to distinguish between the reliance to be placed upon practical and scientific experts and the impractical or unqualified, who sometimes beguile them. It is time, too, that intelligent mine managers should know just how far a good Cornishman's judgment continues to be the best thing to be followed; likewise how far practical millmen, who have learned pan amalgamation by recipe or by apothecary experiments, can be depended upon for the percentages that belong to the bar shipment account, rather than to the tailings. Intelligent capitalists of course understand these points, and know full well how to take care of their own interests. But what shall be said of those mine-owners operating or found "holding on" in the interior who do not deem it important to be informed up to the mark, who cannot afford to or do not see the good of subscribing for a mining journal; who have nothing to learn from professional men in a business requiring so much skill, experience, general knowledge and science, as mining, and beneficiating to profit? Sapient individuals of this class flourish in many a mine and mill who are yet furnishing the advice and "talk" to those capitalists who buy and sell, or to the greenhorn capitalists who are accidentally in possession of money which they wish to get rid of in so fine a business as imaginative mining.

Mission Woolen Mills.—Miss Annie E. Dickinson and party visited these works and the Pioneer Knitting Mills last week, examining them with a great deal of interest and satisfaction. The works were in full operation, turning out large quantities of superior goods. At twelve o'clock over two hundred Chinamen were found seated in the dining hall, operating their "licee" with chop sticks, affording an amusing spectacle to the visitors. It would take a long article to describe a visit to these mills, and we will only add that our compliments are due to the intelligent gentlemen that showed us around.

Sensible Views.

We would call especial attention of our readers to the remarks of Mr. Raymond, Commissioner of Mines, made before the Academy of Sciences, on Monday last. The views there expressed are eminently sensible and practical. We fully concur with Mr. Raymond in his remarks generally, and especially in his expression that "the license given to all citizens to mine freely on the public lands ought not to be so construed as to permit claims to be held without being worked."

The evil of speculation without capital was well and truly set forth, as well as the flagrant wrongs which have resulted from, and are still inherent in our present mining laws, enabling lazy and dishonest persons to reap the fruit of the honest labor of others, thereby encouraging trickery and indolence. There was also much truth in the remark that our miners are constantly making and wasting knowledge, instead of utilizing it. We regret that we are not able to present to our readers a more full report of his really practical and interesting remarks. Mr. Raymond leaves this city early in the week for Oregon and the mines of Idaho, from which latter he will make his way to the Pacific Railroad on his way home. By the time of his arrival in New York Mr. R. will have traveled fully 15,000 miles in accomplishing the mission to which he has been appointed for the present year.

The State University.

The Board of Regents of the State University held a meetings on Tuesday last, which was devoted mainly to the consideration of the report of the Building Committee. This committee, consisting of Messrs Butterworth, Hallidie and Sachs, reported—

First—That the plans executed by Messrs. Wright & Sanders be adopted.

Second—That the building designated in the plans as the College of Agriculture, be erected as soon as possible. This building will furnish thirteen recitation rooms, two lecture rooms, a faculty room, a reading room, and a temporary library room, museum, cabinet rooms, etc. Estimated cost in brick, with stone dressing, $140,000.

Third—That a separate building be erected containing chemical laboratory, etc. Estimated cost, $55,000.

Fourth—That a small building be erected as a magnetic observatory, in place of the rooms so designated in the plan of the College of Agriculture. Estimated cost, $5,000.

The report was considered and acted upon in detail; the several recommendations being adopted, and the Executive Committee authorized to take measures to commence the buildings as soon as the question of the State's title to the site was finally settled.

Letters were received from Professors Carr and Swinton, accepting the Professorships to which they were elected at the last meeting.

Judge Sawyer of the Fourth District Court yesterday rendered a decision confirming the title of the University to the 160 acres of land, (the Berkley tract) donated to them by the College of California. This decision was the result of a friendly and agreed case.

Fare and Freight.—It seems to be pretty well conceded now that the through fare for emigrants will soon be placed at $50 from New York and about $38 from Omaha—the two roads, it is said, having agreed upon a *pro rata* of division on that scale.

Freight charges on fruit, it is understood, will be five cents to Chicago and seven cents to New York. The first car was loaded with fruit under the new arrangement at Sacramento on Thursday. About ten tons were carefully arranged in the car, including peaches, nectarines, apricots, pears, apples, limes, plums, prunes, grapes, figs, and samples of some of the minor fruits—the object being to determine what could and what could not be sent through in good condition.

New Method of Preserving Fruit.

Mr. J. S. Houghton, in the *Gardener's Monthly*, of Philadelphia, describes a new method of preserving fruit, which has been recently perfected and patented by Mr. C. B. Recs, of Philadelphia, which promises to be of great value to pomologists, and dealers in fruit. Mr. R. was extensively engaged, during the war, in packing meat and food for the various naval squadrons, and out of this experience was developed a method of cooling a meat or fruit room by the aid of a small quantity of ice, so that both a low temperature and an almost perfect dryness of atmosphere is attained at one and the same time, without artificial absorbents. The principle is economical, simple, and easy of application to either stationary rooms or movable vehicles, as cars, ships, etc. A thorough ventilation—the great lack in the usual mode of preserving by ice—is obtained by this invention.

While in Philadelphia, a few months since, Mr. Houghton, briefly explained to us this process, and showed us the invention in practical use, in that city. It is based upon simple natural laws, and we were told that partially decomposed fruit placed in a room to which this invention was applied, soon became dry; and in cases where mere incipient decay had commenced, the spots so speedily became covered with a thin pellicle, that decomposition would often be entirely arrested. This drying process does not reach to the shrivelling of the fruit, but only so far as to remove the external moisture, and thereby preserve, in its natural and healthy state, the interior or pulp of the pear, apple, or other fruit. We hope soon to be able to give a more particular and full description of this process, which no doubt might be advantageously applied to cars employed in the transportation of fruit from California to the Atlantic States.

The Miners' Strike at White Pine.—We have given, in our Mining Summary, the theory of the White Pine *News* with regard to the strike. Since that was in type we have received a letter from an attentive correspondent who writes of this movement, under date of July 18th, as follows:—The strike, as it is commonly termed, still continues, but will no doubt close this week. Most of the leading mines will reduce the pay of their hands to-morrow to four dollars, and with the exception of a few of the best men, that will be the rate of wages. The Miners' Union has opposed the reduction, but by giving a few contracts they will be neutralized."

A Virginia telegram of the 21st announces the total destruction of the Cholar Potosi's new hoisting works. Everything but the iron work was consumed. The company's boarding house, also, and a large amount of wood and timber, were destroyed. The men all escaped through the Halo & Norcross shaft. The fire originated in a defect in the chimney where it passed through the roof. Loss about $200,000.

The State Agricultural Society has issued its official programme for the State Fair, which is to commence September 6th, and continue till the 11th inclusive. Premiums to the amount of $20,000 and seven gold medals are offered for excellence in almost every variety of useful industry, in which human hands and human brains can engage.

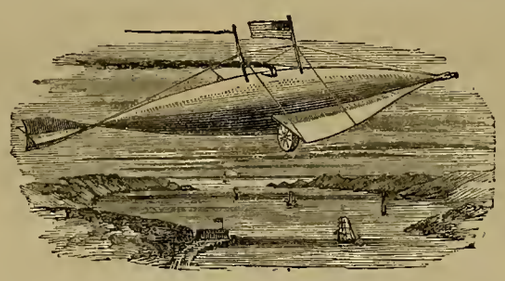
Bad Policy.—It costs about as much for the ferriage of a load of goods across the bay to Oakland—six miles—as it does to transport the same goods from this city to New York *via* Cape Horn. Eight dollars a load is charged for a service of twenty-five minutes. Some of the transportation companies of this State are getting daft; the people will not stand such impositions long.

Have We Solved the Problem of Flying?

The "Avitor" flying machine has been brought to San Francisco, and is now in the Mechanics' Institute Pavilion,—a large building well adapted to a testing of the principles of flying on a small scale—where a number of mechanicians and inventors were on Tuesday last afforded the opportunity to judge for themselves of the merits of Mr. Marriott's invention.

The accompanying engraving represents the Avitor as it is supposed she will appear when making her first trip over the Golden Gate. The propellers are here represented as working below the wings; but in the model at the Pavilion they work inside, showing both above and below. The working of the model has also suggested some slight improvement in the proportions of the machine, which are faithfully represented in the engraving.

So long have men been accustomed to doubt in regard to the practicability of flying—of aerial navigation at will—so ancient is the fancy and desire of the ingenious "lord of creation" to share in the liberty of the denizens of the air, yet so uniformly have all his longings been thwarted on a par with the illogical and impossible perpetual motion, that the wise,



THE "AVITOR" FLYING MACHINE.

the elderly-minded whose hopes are not of budding life and progress, have long continued to shake their heads with the world's full acquiescence in their wisdom. "Man was never made to to fly;" yet he swims, and even amphibiously under water, which is more contrary to his nature than flying.

Had one of our conservative grandfathers entered the Pavilion, as we saw a number of men do on Tuesday, just as the Avitor arose from the ground and coursed through the air past the astonished gazers at the door, (guided only, and held down, by strings fore and aft,) they would have instantaneously reconsidered the soundness and the profundity of their wisdom, and admitted that flying, after all, may yet be accomplished. A sun-fish shaped, likewise very fish-like colored thing about the size of a fifty-ton schooner, was seen making aeronautic *saches*,—evidently flying to and fro without support and entirely of its own accord, like a thing of life; the propelling power being a 45-pound alcohol lamp steam engine, secreted from sight, driving two windmill or propeller fans, one on each side, and scarcely visible as the machine was traveling by.

The sight was, to all present, inspiring, for how could it fail to reawaken in the spectator the fond idea that men are yet destined to fly and that he may live to see the happy day? Has not the Pacific Railroad been built? Nothing, says the inventor and physicist, can hinder or prevent that result but a want of more thorough adaptation of our means to ends. After man's conquest and the wielding of more than ten thousand giants' ceaseless power of steam; of the Titan's prerogative to rend mountains asunder with powder; after his mastery of so almost spiritual a thing as light in photography; after assuming our Maker's attribute of omnipresence in circum-mundane telegraphy,—and after a century of lubberly ballooning itself, may we not begin to question the soundness of our ancient grandfathers' verdict on the problem of flying?

Mr. Marriott's "Avitor" is not, in the ordinary sense, a balloon, since it rests, like the living things of the air, firmly enough, though lightly, on the ground while its two windmill propellers are at rest. The engine-fire having been lighted, this monster flying fish astonished us by taking its departure aerially so much in the manner of a living bird taking wing that the sensation of witnessing it was something refreshingly novel.

It is by a combination of three principles in aerial navigation,—all of them perhaps essential, and all applied in the rationale of the bird,—that the inventor has here added to the actual points of experiment heretofore tested in the history of the attempts to fly. The bird is light, it has the necessary mechanical means of taking hold upon the atmosphere,—just as we are able to take hold of water or of a ladder or steps to lift ourselves; and, at the instant of exerting its lifting force it has a forward gliding on the plane of its wings, the effect of which is to elevate, on the principle of the kite. So far as we are aware, only two of these principles have been heretofore applied in one and the same machine. Tests, very useful and valuable as money-saving means for future experiment toward a solution of the problem of aerial navigation, have been made methodically and are still being made by the London Aeronautical Society, the results of which will greatly redound to the honor of the founders and patrons of that body of scientific mechanicians. From these, it would appear, that an engine alone, including its fuel, can not exert a sufficient power to overcome its own very considerable gravity; and even with an inflated gasometer to overcome the latter, the problem of flying has not been a success. Neither has power combined with the plane, or kite principle, been found wholly practicable. It is not certain, however, but that with lighter engines—electric motors or aluminum machinery possibly—and more perfect screw fan contrivances, the Aeronautical Society may yet arrive at more favorable results on some of these questions.

The Avitor is worthy of a new local sensation at least; and for aught we can see may be the beginning of success in flying. Difficulties that are or may be encountered will give impulse to and call forth skill of others amongst our numerous body of active inventors. Locomotion is demonstrated to be possible. Once started, the least amount of bodily exertion will propel the machine a hundred miles of distance; but the true principle of aerial navigation, we apprehend, will be to take advantage of aerial currents, which are exceedingly interesting, being regular, and capable of being mapped out with almost the accuracy of rivers. A small amount of power exerted in a direction slightly varying from these currents, analogously to steerage or trimming sail to the wind, would be enough to carry the voyageur whithersoever he lists; to old California, by some current like the summer coast winds, thence either to the Sandwich Islands by the trades, or in the exact reverse direction by the counter trades which flow, according to Maury, at a higher altitude with equal regularity; or to Arizona and the Mormon domains by the summer winds from the Gulf of Mexico. With what immediate interest will we study the geography and physical features of distant lands?

The Irishman's trouble of "stopping too suddintly" in a breeze, the starting and the landing of aerial craft, are problems that should not outreach the ingenuity of man. Here is where has been found the principal source of disaster in ballooning. One thing at a time, however: birds, too, must select their perch. We hope that Mr. Marriott's energy in connection with the larger machine which it is proposed to build, will give to the world a demonstration, by long voyages, of a working method of giving direction to the "flight" of an aerial vessel, as the big flying fish in the Pavilion demonstrates it to be perfectly practicable on a scale just large enough for the accommodation of the inventor's "dog Jack."

Fifteen months ago San Francisco first heard of the actual Avitor. A large sized one was then constructed, but it did not fly. Such a result, in a flying machine, was with many conclusive of failure. The difficulty was curiously insignificant: it was found that a gas bag cannot be filled with light gas if it is distended at the beginning and consequently filled with air. The frame is now to be outside, and the balloon can be filled from a collapsed state according to the usual practice.

The Crystal Palace Company, of England, have offered $250 to the exhibitor of a machine which should carry and be worked by a steam engine or other motive power, and sustain and move itself in the air for twenty minutes, at a hight of ten feet from the ground. Whether this machine ever arrives at any commercial success or not, we see no reason why its projectors may not be able to secure the above reward.

Tit for Tat.—Late accounts from China state that a secret society has been organized there, having for its object the exclusion of foreigners from the Celestial empire. The opposition has not yet progressed so far as to assult foreigners in the streets; but merely contents itself with issuing proclamations—probably threatening violence; although we are not advised as to the character of such proclamations. The Chinese are evidently fearful, if foreigners are allowed to come at will, that junks will have to make way for steamboats, palanquins for railroads, and man-power for steam-power, generally, etc. Well, those pagans, after all, are not so very much behind the "most enlightened nations" of the earth.

Alarmed.—The London *News* is frightened at the exodus of Englishmen from Liverpool. In a single week, nearly 7,800 left. This unprecedented efflux is no doubt chiefly due to the fact that the impolitic labor strikes and associations, throughout the land, have sent abroad an undue report of the prices and demand for labor in this country.

Shipping in San Francisco.—There were, a few days since, twenty-nine vessels, with a capacity of 25,517 tons, loading at the wharves in this city for distant ports. There were also, at the same time, thirty-eight vessels, having an aggregate of 27,619 tons, awaiting employment.

Personal.—A. B. Bowers, C. E., author and publisher of the celebrated farm map of the county of Sonoma, and other works, has taken steps to secure through our agency his right to a new invention which looks fair to supply a great want, and add, perhaps, millions to the wealth of this State.

The Right Thing.—A society for the protection of Chinese has been formed in this city. It will find a plenty of work to do, and we presume it will do it.

Professional Cards.

J. S. PHILLIPS, M. E.,
CONSULTING ENGINEER,
Examiner of Mines, etc.,
423 Washington street.....San Francisco.
(Having had 33 years' experience in Europe and America,) supplies drawings and designs for Pumping, Hoisting, Crushing Separating, Roasting, Chlorinizing, Milling, Levigiating, Precipitating, and Smelting Works. Minerals analyzed, and advice given for beneficial treatment. Lessons on the Discrimination and Assay of Minerals by Blowpipe, Chemicals, Scorifier and Crucible. 4v17tf

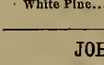
GRAY & HAVEN,
ATTORNEYS AND COUNSELORS AT LAW,
In Building of Pacific Insurance Co., N. E. corner California and Leidesdorff streets,
27v16 SAN FRANCISCO.

R. G. ROWLEY,
ATTORNEY AND COUNSELOR AT LAW,
618 Merchant street,
Between Montgomery and Kearny. P. O. Box 2102, San Francisco. 1v19tf



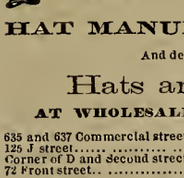
DR. N. T. WHITCOMB,
Dentist,
No. 205 Third street, up stairs, San Francisco
Teeth filled with fine gold, artificial bone, and platina. All Plate Work made and repaired of the best material, at the shortest notice, and warranted.
None cheaper and better on this coast—call and examine specimens.
North Beach and South Park cars pass the door.
3v19-3m N. T. WHITCOMB.

DR. KNOWLES, Dentist,

HAS REMOVED FROM MONTGOMERY to **331** Kearny street, west side, between Pine and Bush, San Francisco.
21v16-1y

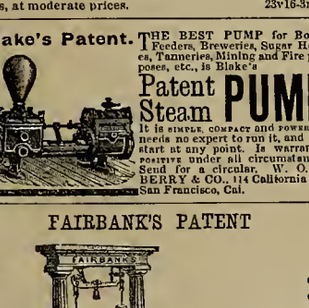
MEUSSDORFFER,

HAT MANUFACTURER
And dealer in
Hats and Caps
AT WHOLESALE AND RETAIL.
635 and 637 Commercial street.....San Francisco.
125 J street.....Sacramento.
Corner of D and Second streets.....Marysville.
72 Front street.....Portland, Oregon.
Our wholesale House, 623 Commercial street, extending through to 637 Clay street, San Francisco, contains always a most choice, and the largest, assortment in this State. Every Steamer brings the latest issued novelties from Europe and New York, which can be found at all the above stores, at moderate prices. 23v16-3m

Blake's Patent. THE BEST PUMP for Boiler Feeders, Breweries, Sugar Houses, Tanneries, Mining and Fire purposes, etc., is Blake's


Patent Steam PUMP
It is SIMPLE, COMPACT and POWERFUL, needs no expert to run it, and will start at any point. Is warranted POSITIVE under all circumstances. Send for a circular. W. O. M. BERRY & CO., 114 California St., San Francisco, Cal.

FAIRBANK'S PATENT
U. S. STANDARD



COUNTER AND
PLATFORM SCALES!
Also, large Scales for weighing loaded wagons of Ore, Hay, etc., from 6,000 to 40,000 pounds capacity. Manufacturer's Branch House,
FAIRBANKS & HUTCHINSON,
124 California street, San Francisco.
Agents for Baldwin's Improved Money Drawers.
☞ Send for a Catalogue. 18v1-eow6m

Blanks, Blank Mining Books
Constitution and By-Laws

Metallurgy.

MOSHEIMER'S
PIONEER MINING SCHOOL,
—AND—
METALLURGIC WORKS.
Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of
Chemistry, Assaying and Metallurgy,
That I am prepared to teach all the above branches in less time than in any European School.
I also undertake to assay and work any kind of ore, or mineral substances.
For terms, apply to **JOS. MOSHEIMER,**
Practical Chemist and Metallurgist.
Office, 328 Montgomery street; Metallurgic Works. 2005 Powell street, San Francisco. 6v18-6m

LEOPOLD KUH,
Assayer and Metallurgical Chemist,
(Formerly of the U. S. B. Mint, S. F.)
Office, No. 611 Commercial Street, opposite the Mint, San Francisco.
BULLION MELTED AND ASSAYED,
The correctess of which is guaranteed in every respect All kinds of Ore and Mineral tested, assayed and analyzed in the most satisfactory manner.
Refers by permission to W. C. Ralston, Cashier Bank of California; Messrs. Pioche & Bayerque, Wm. M. Lent, John D. Fry, E. Cahill & Co., A. K. Grim, President Pacific Union Express Co.; John M. Eckfeldt, M. and R. U. S. B. Mint; Hale & Norcross S. M. Co., and the principal mining companies on the Comstock Lode. 25v17-tf

PROF. HENRY WURTZ,
Formerly Chemical Examiner in the U. S. Patent Office may be employed professionally as a SCIENTIFIC EXPERT. Geological Examinations and Reports, Analysis and Assays, etc., etc. Practical advice and investigations in the Chemical Arts and Manufactures. Invention and examination of new chemical methods and products. Address, 26 Pine street, Rooms 35 and 36, New York. Always in from 12 to 3.30. ☞ Written communications preferred.

Important to Gold and Silver Miners and Companies.
PROFESSOR WURTZ,
Who is the Inventor and Patentee of the new and wonderful uses of SODIUM IN WORKING GOLD AND SILVER ORES AND JEWELERS' SWEEPINGS, will furnish at the above address information in relation thereto, together with experimental packages of
SODIUM AMALGAM.
All instructions and experiments elsewhere obtained are spurious and unreliable. WORKING EXPERIMENTS ON AMALGAMATION OF ORES, Etc. Prof. W. has in operation in New York a large and small Hepburn Pan, for working 1,000 or 20-lb. charges of material for experimental purposes. 3v17-1y

R. TAYLOR. WM. H. TAYLOR.
ROBERT TAYLOR & CO.,
METALLURGISTS.
SMELTING WORKS,
Twelfth street, between Folsom and Howard.

To Quartz Mining Companies.
To be sold positively within the next three months—the MINES, ENGINE, MILL, and entire Machinery of the TEMPLAR NO. 2 Quartz Mining Company, located at Indiana Ranch, Yuba County, consisting of—
One Steam Engine, 60 horse power, made by Burden, Brooklyn, New York.
Two large Boilers, in complete order.
One Eight-stamp Battery.
One Chile Mill.
One Cornish Lift-Pump, 6 inches, of superior make and finish.
280 feet of 5 inch Iron Suction Pipe.
One large Water Tank.
And also all of the necessary machinery, with Belting, Feed Pumps, Hose, Turn Tables, Cars, Rope, Track Iron, Flumes, Plates, with Blacksmith Shop and all Tools and requisite implements to be found in a large and first class quartz mill.
The Company having ceased operations intend selling off their effects as speedily as possible.
For Particulars as to price, etc., address, by letter or otherwise, L. W. CAMPER, at Indiana Ranch; GEORGE B. HORNISH, Marysville; or E. W. HASKELL, Pacific Fruit Market, San Francisco. 24v18-1m

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the PRESS from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

A WEEK'S WORK IN BIRMINGHAM.—"Fourteen million pens, ten tons of pins, four thousand miles of iron and steel wire, three hundred million cut nails, one hundred million buttons, six thousand bedsteads, seven thousand guns, twenty thousand pairs of spectacles, one thousand saddles, thirty-eight thousand pounds' worth of jewelry, six tons of *papier mache* ware, five tons of hair-pins, hooks and eyes, and eyelets, one hundred and thirty thousand gross of wood screws, five hundred tons of nuts, screw-bolts, spikes, and rivets, fifty tons of wrought-iron hinges, three hundred miles length of wax for vestas, forty tons of refined metal, forty tons of German silver, one thousand dozen of fenders, three thousand five hundred bellows, one thousand roasting-jacks, one hundred and fifty sewing machines, eight hundred tons of brass and copper wares, besides an almost endless multitude of miscellaneous articles, of which no statistics can be given."

AMOUNT OF MATERIAL IN THE NEW CABLE. The copper wire in the French cable would, if laid out in a straight line, be sufficient to just go round the world; the iron wire would go round one and a half times; the Manila strands would go round five times.

A NEW
Gold Metal.

THE GOLD METAL WATCHES
Now being introduced by
C. E. COLLINS & CO.,
No. 629 Washington Street,
SAN FRANCISCO,
Surpass anything yet made in the way of an Imitation Gold Watch. They wear well, and keep good time.
The Ladies' Watches cost $8 and $10 each.
The Gentlemen's cost $15 and $20 each.
Chains, from $3 to $6 each.

RECOMMENDATIONS:
SAN FRANCISCO, May 12, 1869.
This is to certify, that I have carried one of the small size Gold Metal Watches which I got of C. E Collins & Co., and I find that it runs as well, and keeps as good time, as any watch I ever carried, and I can therefore recommend them. I am engaged on the Sacramento steamer "Chrysopolis." C. A. COLBY.

I am engineer on the San Jose Railroad. I have been carrying one of C. E. Collins & Co's watches for about one year, and I can safely say it is the very best watch for time that I have ever seen. GEO. CORNWALL.
Engineer on the San Jose Railroad.

BATAVIA, July 6th, 1869.
MESSRS. C. E. COLLINS & CO.—Gentlemen:—I received the Lady's Watch sent by you, and was much pleased with it. I wish to know what you will furnish me six of them for, with chains to match. Yours, etc.,
W. H. DUKE,
Batavia, C. P. R. R.

The public are cautioned against buying their watches at high prices, as many of them are sold for genuine *Gold Watches*, at from $100 to $150 each.
For List of Prices and Description of Goods, send directly to us. Can be sent by Express to be paid for on delivery.
C. E. COLLINS & CO.,
No. 629 Washington street, San Francisco.
P. S.—Where six watches of the above are ordered at one time, we will send one extra, free of all charges.
We also deal in the finest Gold and Silver Watches, Watch Materials, etc. Send for circulars or prices.

CARLOS O'DONNELL'S
California Cordial Tonic,
—OR—
Wild Cherry Bitters.
TRADE C. O. D. MARK.
This elegant preparation is acknowledged by all who have used it to be the most efficient remedy for every disease of the
STOMACH AND BOWELS,
Yet introduced to the notice of the public. Immediately on taking a dose of it, the patient will find a genial glow pervading his entire system, and its steady use for a short time will be followed by a healthy appetite and a good digestion, even in the case of the most confirmed dyspeptic.
To all who are suffering from
INDIGESTION,
DYSPEPSIA,
DYSENTERY,
DIARRHŒA,
NERVOUS AFFECTIONS,
Or any of the manifold troubles caused by a diseased action of the stomach, this remedy is confidently recommended as a safe and certain cure.
N. B. JACOBS & CO., Sole Agents,
15v18-3m 423 Front street, San Francisco.

That will resist the extremes of heat and cold without liquefying or hardening.
It is therefore peculiarly adapted to the varied climate of this coast, especially localities where THE WEATHER BECOMES EXCESSIVELY HOT, causing oil and all other kinds of grease to run from the axle, retaining the proper position. It remains soft until exhausted, leaving no deposit of GUM, TAR OR PITCH. Its superior lubricating properties, durability and cheapness have been tried and approved by the CENTRAL PACIFIC AND OTHER RAILROADS, STAGE PROPRIETORS, STABLE KEEPERS, TEAMSTERS, CONTRACTORS, MILLMEN, FARMERS, and many others who prefer to
USE NONE BUT THE BEST.
It being prepared by a peculiar CHEMICAL COMBINATION OF OIL, previously freed from gum or other deleterious substances, it must be obvious that by its use friction will be reduced to the lowest point. We feel assured that all desiring A NO. 1 LUBRICATOR will give this the preference over any other Grease IN THE MARKET.
Sold by the Trade generally, and at the Factory, 109 Commercial street, San Francisco.

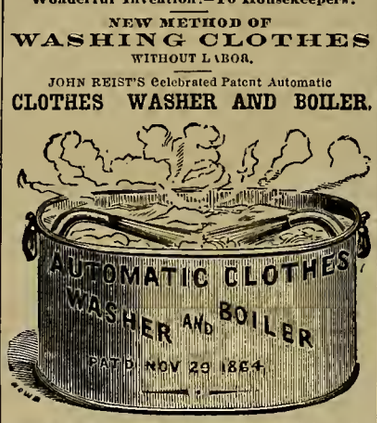
Ayer's
Hair Vigor,
For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* This hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a
HAIR DRESSING,
nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.
Prepared by Dr. J. C. Ayer & Co.,
PRACTICAL AND ANALYTICAL CHEMISTS,
LOWELL, MASS.
PRICE $1.00.
Sold by all druggists and dealers in medicine everywhere. Crane & Brigham, San Francisco; R. H McDonald & Co., Sacramento, General Agents. 25v18eowim

Wonderful Invention!—To Housekeepers!
NEW METHOD OF
WASHING CLOTHES
WITHOUT LABOR.
JOHN REIST'S Celebrated Patent Automatic
CLOTHES WASHER AND BOILER.



This Boiler is most effectual, reliable, and universally recommended; and is the first SELF-ACTING, PORTABLE WASH BOILER, for household purposes ever made, and strange to say, has never been improved, as nearly all others, "which are infringements," have proved total failures. See decision U. S. Patent Office, November 4, 1868.
See its wonderful operation and you cannot do without it. WM. FRIEL, Agent for San Francisco,
Dealer in Stoves and Tinware.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various Importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.
6v18-6m

New Almaden Vichy Water,
(CALIFORNIA VICHY WATER.)
FROM THE SPRINGS,
NEW ALMADEN,
Santa Clara County.
F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.
OFFICE, 506 JACKSON STREET,
GENERAL DEPOT:
Corner of Jackson and Montgomery streets.
This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the veinous circulation.
It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.
California Vichy Water is used with success in many cases, such as—
Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever*; Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoids; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever*; Gout, *when the patient is still able to walk*; Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.
(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.
PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.
Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

Mining Property for Sale.
A Two Thirds Interest
OF THE
Golden Rule Mining Company's
Claims and Mill,
Situated in Tuolumne County, California, two and a half miles south of Jamestown, on the Great Mother Quartz Lode. A good 15-stamp Water Power Quartz Mill is situated on the property, with a never-failing supply of water, as can be shown by the last four years continual running. This Claim has three parallel Ledges, from 50 to 100 feet apart, averaging from two to six feet in width, with a length of six hundred feet. They are so situated that a tunnel has been run through them at right angles, making a surface drainage of from seventy to eighty feet in depth on the mine. The mine is well ventilated by shafts from the surface, and well timbered so far as worked. In the mine are steam Hoisting Works, capable of hoisting from a depth of 300 feet. A force of thirteen men only are required to keep both mill and mine running regularly.
On the surface and flats for a distance of 500 feet from these veins, the ground or surface was mined by placer miners, in former years, producing from two to five ounces per day to the man, during the season when water could be obtained, which factgoes to prove that a heavy deposit of ore was once contained in the croppings of these shutes, which, by all former and present theories of deep mine workings, came from below, indicating that when sunk upon to a proper depth, the lead will develop a mine equal to the Amador or Eureka.
This claim has paid its 19th regular dividend of $1,500 each, during the past four years, besides all the construction and other expense account, and has levied no assessments during the same time, and at present has on hand $8,000 in the Treasury, and no debts.
The last level, 150 feet from the surface rock, averaged $7 per ton, on which was a profit of from $1 to $1 50 per ton. The length of the two shutes of ore on the east vein, and the only one worked upon, has been about 200 feet.
Now I propose to sell two thirds of this valuable property for $16,000, cash; and any party who desires to purchase a property of this kind—which theory has proven that irrequires depth, on well known shutes of ore, for a sure fortune—can obtain a chance here, providing he or they will go down a sufficient depth. No purchaser is solicited unless he first goes and examine the mine, or sends a mining engineer in whom he can have confidence, to indorse what he may think proper of what has been here stated.
For any further particulars, direct by letter to Wm. Bosworth, San Francisco, P. O. Box 1978, or at my office, room No. 5, over Donohoe & Kelly's Bank.
22v18tfqr WM. BOSWORTH.

A Long Desired Article
FOR CLEANING THE HEAD AND HAIR. THE CLEANing of the head and hair has been the subject of consideration for a long time. This object will be accomplished by using
CAMILLE CHAMPOO,
which not only does away with the poor soap so offensive to use, and so injurious to the hair, but it cleans the head, strengthens and beautifies the hair, preserves the color, and prevents baldness. It is cooling in nature, and can be used with safety and reliance on the smallest infant. Price 50 cents per bottle. Prepared by EMERTON & LUELLING, 773 Mission street, San Francisco, Cal.
HEATHFIELD & BOGLE, Wholesale Druggists, 206 and 208 Battery street, San Francisco, sole Agents for the Pacific Coast. 24v18-3m

New Books.

The Practical Application of the Slide Valve and Link Motion to Stationary, Portable, Locomotive and Marine Engines, with New and Simple Methods for Proportioning the Parts—By Wm. S. Auchinclass, C. E. Price, $3.

The aim of this very useful book is to give a series of simple and efficient rules "for determining the proportions suitable to any link motion without the assistance of an expensive and cumbrous model, or the delays incident to its manipulation." From the great number of variable quantities introduced by the peculiarities and connections of the link, it is impossible to construct any algebraic formula which shall solve all the various problems; and the author, while admitting this, has still succeeded in giving a number of rules, so that by the use of an easily-constructed template and two sheets of drawings,—one containing the various positions of the eccentric, and the other the journeyings of the link,—all the most important problems may be solved, and the arrangement of the parts determined, by any one of ordinary skill.

Another portion of the work, and one which has grown incidentally out of the main feature, is a comprehensive view of the causes which regulate the form and dimensions of the cylinder, slide valve and eccentric; and this is admirably treated, giving a clear and concise statement of these causes. The stroke table, the table of crank angles, and others, together with the travel scale, render the work well worthy of perusal, and should render it invaluable to the mechanic. For sale by A. Roman & Co.

Beet Root Sugar and Cultivation of the Beet—By E. B. Grant. Boston: Lee & Sheppard, 1867. 12mo, pp. 158.

Sugar producing is one of the most important and best paid industries that can be pursued by the agriculturist. The success of beet-root sugar in Europe and the fact that the United States consumes 400,000 tons annually, while it produces only 50,000—leaving 350,000 tons to be imported—has induced the author to gather these useful data for the guidance of agriculturists in this country. Part I gives the history of beet sugar. Part II is a practical and purely agricultural manual. Price, $1.

Three Seasons in European Vineyards—Treating of vine culture; vine disease and its cure; wine making and wines, red and white; and wine-drinking as affecting health and morals—by Wm. J. Flagg. New York: Harper Bros., 1869. 12mo, pp. 332.

Mr. Flagg visited the vineyards of Bordeaux, Augustaine, Medoc, Sauterne, Langedoc, Burgundy, Epernay, Rheims, the Rhine, Durkheim, Switzerland, Italy, etc., and discusses such practical questions as would suggest themselves to an American vine culturist abroad; *wine making* being kept constantly in view as the more important question. Pasteur's and other new processes are described. The gay spirit of the vineyards is reproduced in the author's piquant handling of the subject. More information will be gathered out of this book than out of many of the heavier manuals. Price, $1.50.

New Incorporations.

State Line G. & S. M. Co.—July 20. Capital stock, $1,000,000; shares, $100 each. Trustees: H. B. Angell, J. Augell, G. W. Prescott and J. H. Stewart.

California Slate Co.—Calaveras county. July 20. Capital stock, $600,000; shares, $100. Trustees: F. L. A. Pioche, L. L. Robinson, E. A. Robinson, William Alvord and S. F. Butterworth.

Almo S. M. Co.—White Pine. July 22. Capital stock, $1,000,000; 10,000 shares, $100 each. Trustees: G. M. Burnham, P. H. Blake, C. L. Prince, W. M. Worcester and W. B. Latham, Jr.

Berkeley View Homestead Association.—July 20. Capital stock, $18,300.

Linnen Homestean Association.—July 20. Capital stock, $23,000.

Silver Going East Overland. — A consigument of three tons of silver bricks were recently received at Chicago, in one day, by the Pacific Railroad.

California Academy of Sciences.

At the meeting of the Academy, held on Monday evening, David Hughes, Samuel Brannan, Jr., W. W. Dodge and Dr. W. H. Titcomb were elected resident members. Dr. T. Van Orden presented some interesting specimens from Treasure City, Whithe Pine; and Mr. Plummer, of San Antonio, a section of a Puget Sound pine log containing a bullet which may have been shot into the tree fully 100 years ago, as over that number of concentric rings of annual growth had been formed over it.

Interesting Remarks from Mr. R. W. Raymond.

Mr. R. W. Raymond, Commissioner of Mining Statistics for the mines west of the Rocky Mountains was present, and on invitatation of the President, Dr. Cooper, made some very interesting remarks with reference to the mines and mining interests, of which the following is a condensed report: He declared the doctrine of a crown right over the precious metals, or any other mineral treasures, to be unfounded in history, law and equity; and any policy or mining system founded upon the assumption of such a right to be unwise and unsuited to the institutions of a democratic State. The gold and silver mines of the West are under the control of the Government, simply because they are on the public domain; and the best thing that can be done with the mineral lands is just what is done with the agricultural lands—sell them as fast as possible to the citizens who will develop them. The effect of the present United States miniug law was analytically explained, and it was shown that in its sweeping recognition of the "customs" of the mining districts, which are often whimsical and unjust, and always shifting and uncertain, the law defeats its own object. Mr. Raymond insisted that the license given to all citizens of the United States to mine freely on the public lands ought not to be so constructed as to permit claims to be held without beiug worked.

Claims should be so recorded that they can be legally identified; and then a reasonable amount of work, and a maintenance of landmarks should be absolutely required, to secure the possessory title. No title but that of the United States should be considered permaneut and unforfeitable. The evil results of stock speculatiou and swindling or foolishly mismanaged companies are insignificant, compared with the curse of speculation without capital, which infests the mining districts.

At the present time, many districts have passed through the stage of speculation in the ordinary sense, and the inhabitants are beginning with indnstry and persoual attention to economy to do for themselves what formerly they waited supinely for others to do; and it is just at this point that the incubus of old mining laws makes itself most oppressively felt. No sooner does the *bona fide* miner, with perseverance and skill, in a half-abandoned neighborhood, discover, develop and utilize with profit the mineral wealth of the public domain, than an old "location" is revived, and under some forgotten law, the assignee of some forgotteu "locator" lays claim to the fruit of which he never even planted the seed. The mining speculations of which we hear so much complaint, do, after all, help the development of the country. They pay out money, and when they finally explode, they leave in the mining districts good buildings and pleuty of old iron. But this speculatiou, without capital, actually destroys the freedom of the miner upon the public lands, and throttles industry from the beginning.

Passing to other points connected with mining industry, Mr. Raymond reiterated his conviction of the necessity of an *American* science of mining and metallurgy. Most meu, said he, seem to think science means Germany, and books. Now we are makiug science on this coast every day, and throwing it away. What I want is to collect and save it. What is called "practico" is experience wasted, or selfishly kept secret. The best agency for the concentration and crystallizatiou of our great expericuce in the mines, mills and furnaces of this country, would be a National School of Mines.

In conclusion, the Commissioner appealed to the members of the Academy, as men of science, to be also men of the people, to take an interest in the application of knowledge to life, and to assist by every meaus in their power in the solution of the economical, social, political, mechanical and other problems which vitally concern the present and future of this country.

Mr. Raymond solicits at all times from the citizens of this slope, iuformation, suggestions, inquiries and opinions concerning any subject related to the miniug interests. Communications may be addressed to him at his office, 37 Park Row, New York. He leaves this city in a few days for a personal inspection of the mining districts of Oregon, Idaho and Montana. His report for 1868 has been published, and can be obtained through members of the House of Representatives. Copies of the special edition, published by a house in New York, can be obtained through any bookseller.

In private conversation the Commissioner, who has visited already, this season, Colorado, Wyoming, Utah, White Pine, Reese River, Washoe, Grass Valley, etc., expresses himself as satisfied that the bullion production will equal if not surpass that of 1868, while the basis upon which mining enterprise stands is palpably becoming every year less fanciful and more business-like. The supreme needs at present are a universal, simple and consistent law, giving sure titles, and some organized ageucy for both the collection and the diffusion of information.

New Rule About Patent Office Drawings.

Hereafter, in accordance with the new rule of the Commissioner of Patents, all drawings sent to the Pateut Office will be returned to the applicant or his agent, unless they are artistically made. The principal reason for this grows out of the fact that duplicate drawings are to be photographed—one copy to he attached to the patent, and other copies are to be used for the convenience of the examiners in charge of the respective classes. The Commissioner advises applicants to employ competent artists to execute their drawings, which is also a good suggestion.

The promulgation of this new rule leads us to remark, that recently there has grown up a practice on the part of some agents to file miserably prepared drawings, simply for the reason that their slip-shod manner of doing business has forced them to adopt the cheapest possible plan. The consequence is that the portfolios of the office are encumbered with a mass of rough outline sketches, which are neither artistic nor creditable to the office. The Commissioner evidently does not mean to encourago this disregard of artistic merit. He has a right to insist that all drawings hereafter to be filed shall possess a certain degree of excellence and faithfully illustrate the invention in detail.—*Sci. American.*

The above remarks are quite true. We are frequently called upon to make proper drawings (as well as amendments to specifications) prepared and sent to the Patent Office months previously by inventors themselves, or their incompetent agents.

Quick Work.—The Chicago party visited the San Francisco Board of Brokers on Saturday last, and were very much surprised to have printed copies of the proceedings of the Board placed in their hands, within four minutes after the Board adjourned; but Wheeler & Co. did it.

To Make a Balky Horse Draw.—In India, where a horse can and will not draw, instead of whipping or burning him, as is frequently the practice in more civilized countries, they quietly get a rope, and attaching it to one of the fore feet, one or two men take hold of it, and advancing a few paces ahead of the horse, pull their best. No matter how stubborn the animal may be, a few doses of such treatment effect a perfect cure.

Sink of the Eberhardt.—We have received a steroscopic view of the "Sink of the Eberhardt" mine, on Treasure Hill, White Pine, Nevada, showing the portal of the tunnel and how it is situated in the hill side.

Gold Fish in the Potomac.—It is said that the Potomac is becoming stocked with gold fish, from a few that escaped into it out of the Capitol fountain.

Ore from Humboldt.—We have received several very fine and somewhat unique specimens of ore from Humboldt, with assays, which will be noticed next week.

Another.—It is stated that parties in Chicago have commenced the construction of an air-ship, similar to the Avitor of this city.

Inventions and Patents.

New Patents Issued to Pacific Coast Inventors.

[From Official Reports to Dewey & Co., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

Copies of U. S. Patent Claims furnished immediately at small cost. Full copies of American or Foreign Patents can be obtained by telegraph or mail through this office at favorable rates.

For the Week Ending July 13th.

Composition for Tonaoco Substitute.—J. Bertram Webster, Stockton, Cal., assignor to himself, W. E. Greene and H. Winslow, same place.—92,497.

Wire Cutter.—H. Axtell, Yreka, Cal.—92,507.

Door Clamp.—H. O. Hooper, Diamond Springs, Cal.—92,531.

Reciprocating Force Bellows. — Butler & Stucker, Silver City, Idaho Territory. 92,580.

This invention relates to an antomatic bellows for furnishing blasts of air for various purposes, but more particularly for blacksmiths' forges, the ventilation of mines and for foundry blasts. The machine is composed of two bellows, working horizontally on guides. Valves are placed at either end of the horizontal bellows, by which means the air is drawn in and forced into a reservoir placed in front of the bellows, from which it is forced out through a nozzle. The two horizontal bellows are operated by means of a spring and gears, so that all that is necessary to do to furnish a blast is to wind up the spring and let the machine blow.

Molding Machine—James Hatch, San Francisco, Cal.—92,609.

Globe Lamp.—John W. Shehan, San Francisco, Cal.—92,661.

Let us have more light! This exclamation we frequently hear and oftener see in print, but the light asked for in most cases has been of the intellectual kind. Mr. Shehan in this inventiou has endeavored to improve our artifical lights in order to remove the darkness more effectually than can ho done by the use of the common globe lamp. The invention consists in making the globe which surrounds the light or flame double, and filling the space between them with clear water. By this arrangement he claims that the rays of light in passing through the water will be refracted or broken, and thus light up the entire globe into a bright luminous body, giving a much greater intensity of light than the direct rays can possibly furnish. The chief point of inveution rolates to the apparatus for regulating the supply of water which fills the space between the globes.

Can Opener.—M. E. Davis, Folsom, Cal. 92,520.

The Mining and Scientific Press, published by Dewey & Co., San Francisco, is among the most valuable publications on the Pacific Coast, especially to a mining community.—*White Pine Telegram.*

Resources & Developments

COFFEE IN LOS ANGELES.—A gentleman in Los Angeles is going into an extensive exporiment in coffoo raising. He has already received the seed.

THE OVERLAND STAGE CO. aro abont to transfer their stock to the southern route, and will establish a new lino through Arizona and New Mexico, making San Bernardino their starting point.

EUROPEAN IMMIGRATION.—Much interest is felt in favor of some concerted plan by which California may be ablo to socnro a greater sharo of the skilled emigrants which are now ponring into the Eastern States. Our great land monopolists, and high fares by steamer and railroad are pronounced the chief hindrances in the way. Both land owners and transportation companies are working against their own interests by their excessive charges.

SLATE IN SAN JOAQUIN.—Another slato quarry has been opened, a few miles to the northward of the Copperopolis road, in San Joaquin county, which promises equally well, if not better than the one to which attention has been already called, to the south of that road. The quarry is owned by Messrs. Hendsch & Govey. This slate is wholly free from iron stains and iron pyrites; it is described by the Stockton *Independent* as being remarkably compact, smooth, readily spliting into sheets of any desired thickness, and snitable for school slates, for rooting or billiard tables.

TULARE COUNTY.—Settlements on the Tnle river are said to be progressing more rapidly than almost any other portion of the State.

TULE RIVER SODA WATER.—Another sparkling soda spring has been discovered on tho Tnle river, sixteen miles above Vandalia, where the temperature is 15° to 20° ahove that of the surrounding valley, and where brook trout are plenty.

FRUIT AND VEGETABLE GARDENS are becoming quite plenty on the San Joaqnin, between Rongh and Ready and Mossdale. These banks, formerly covered with an intermixable series of tules and brush, are being fast reclaimed, and hundreds of acres have been leased to Chinamen, by whom the grrdens aro chiefly carried on. The Western Pacific crosses the river at Mossdale.

DOORS.—Immense numbers of sugar pine doors are made in the Sierra timber region, above Placerville. Twelve hnndred and fifty came down the other day, from Hooper & Lepctit's mill, in a single shipment, to a firm in this city.

MACKEREL.—The Monterey *Democrat* reports whales in large numbers in the bay of Montercy. Seven were bagged in one week by the whalers in that place. Mackerel have also made their appearance, after an absence of many years.

CODFISH.—The J. H. Roscoe arrived a few days since, bringing 45,000 codfish. She brings reports from teu others of the codfishing fleet in the Alaska waters, whose aggregate catch up to July 5th was 214,000 fish.

SALMON.—An export demand for Oregon salmon is gradually growing up. Two hundred cases were shipped a few days since to Australia and 764 to New York. Shipments to the latter port are quite frequent. Oregon salmon, properly packed, compare favorably with those put up in the best markets in the world. We are glad to know that they have been eo successfully introduced into the Eastern market.

PRODUCE RECEIPTS.—The excess in the receipts of wheat, barley and oats, in this city, during the first eighteen days of July, over that for the same period, last year, was within a fraction of 60,000 sacks—an increase of nearly 50 per cent.

IVORY.—A gentleman from Koliak informs the editor of the Alaska *Herald* that he has seen an immense quantity of mammoth ivory in the Peninsula of Alaska. The natives make furniture for their houses from it.

LEGHORN STRAW.—The *Alta* suggests the introduction of the culture of Leghorn etraw into this State, and says that the upper foot-hills have just the soil and climate for such production. Tuscany exports this straw to the valne of a million a year, all of which is cultivated in soil under just euch conditions as exist in our foot-hills. This straw is a peculiar variety of wheat, which must be cultivated in a light, dry soil; it must be sown thickly, so as to be stunted in its growth, and cut before ripening. The great care is in cutting and bleaching it—for which the climate of California is better even than that of Italy.

ANOTHER SUGAR REFINERY has been incorporated in this city, with a capital of $200,000. A frame building for the company's works, is now being put up in Hayes Valley. It will have a capacity of five tons a day. There are already four refineries in this city, although three—the Bay, San Francisco and Pacific are under one management. The California, which is the fourth one, and the Pacific—tho two that are running—are capable of turning out seventy tons per day—an amount equal to the present consumption of the coast. It is doubtless to the prospective increase of this coast, which the new company looks for success. There were 20,000 tons of raw sugar received at this port last year; which amount will be increased by at least 2,500 tons for the current year.

MINING ITEMS IN BRIEF.

FOR ARIZONA.—There is a large prospecting party being made up in Grass Valley to go to Arizona to search for the precions metals. The party will be well provided with arms, provisions and animals, and they intend to visit unexplored regions in spite of weathor or Indians.

THE Allison Ranch Company of Grass Valley, are applying for a patent to their mine.

GOLD DISCOVERY IN MEXICO.—It is reported that gold fields 120 miles long, exceeding California mines in richness, have been discovered near Colima, Northwestern Mexico, and that diggers are gathering there in large numbers.

MAGNETIC IRON ORE.—A large bed of magnetic iron or loadstone, exists in Cope district, which, it is said, by its attraction, draws upon it the lightning of every thunder-storm. The surface of the ledge lies in waves of solidified slag, blackened and glazed like the cinders of a blacksmith's forge, doubtless from the effects of lightning, which for ages has made this spot its target.

BLOODSTONE.—A valuable bed of bloodstone has recently been discovered by Prof. Shephard, near St. Mary, Mo. There is one other place in the United States, near Troy, N. Y., where it has been found. This mineral is highly esteemed for ornamental work, and is similar, in hardness and compositiou, to agate. It may be known by the presence of numerous red or yellow spots (dots) on a greenish ground. It is of a resinous luster.

THE DIAMOND DRILL is to be put into operation in Colorado this year. Prof. Whitney has contracted to bore eight hundred feet into Fletcher Mountain, Summit County, and expects to do the work in thirty or forty days. The hole is to be six inches in diameter, and will pierce some leads 1,200 feet deep.

New Mining Advertisements.

Cordillera Gold and Silver Mining Company.— Morelos District, Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of July, 1869, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 321 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the eighth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY R. REED, Secretary.
Office, 321 Washington street, San Francisco. jy21

French Silver Mining Company.—Location of Works: White Pine District, (formerly Lander County), State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of July, 1869, an assessment of five (5c.) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No 502 Montgomery street, Room No. 3, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before will be sold on Monday, the thirteenth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

AUG. DUPRAT, Secretary.
Office, No. 502 Montgomery street, Room No. 3, San Francisco, Cal. jy24

Marlborough Silver Mining Company.—Location of Works: White Pine District, (formerly Lander County), State of Nevada,

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of July, 1869, an assessment of five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 502 Montgomery street, Room No. 3, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1869, shall be deemed delinquent and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirteenth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

AUG. DUPRAT, Secretary.
Office, No. 502 Montgomery street, Room No. 3, San Francisco, Cal. jy24

Lyon Mill and Mining Company, Kelsey District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty first day of July, 1869, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twentieth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.
Office, Room 37 New Merchants' Exchange, California street, San Francisco. jy24

Mining Notices--Continued.

Daniel Webster Silver Mining Company.—Location of Works: White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of June, 1869, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office.

Any stock upon which said assessment shall remain unpaid on the thirtieth (30th) day of July, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the nineteenth day of August, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.
Office, 418 California street, San Francisco, Cal. jy3

Evening Star, No. 1, Silver Mining Company Location of Works: White Pine District, White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of June, 1869, an assessment of ten cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 302 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Saturday, the thirty-first day of July, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twenty-first day of August, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.
Office, Room No. 6, No. 302 Montgomery street, San Francisco, Cal. je26

North Star Gold Mining Company---Location of Works: Grass Valley, Nevada County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the fourth day of June, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the fourth day of June, 1869, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, Room 10 at No 402 Montgomery street, San Francisco, on Friday, the thirtieth day of July, 1869, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. W. COLBURN, Secretary.
Office, room No. 10 second floor of No. 402 Montgomery street, San Francisco jy10

George Washington Silver Mining Company, White Pine, Nevada.

NOTICE.—The Annual Meeting of the Stockholders of the above named Company, for the election of Trustees for the ensuing year, will be held at the office of the Company, No. 10 Stevenson Building, S. W. corner Montgomery and California streets, on FRIDAY, the 23d day of July, 1869, at 4 o'clock P. M.. Per order.

THOS. J. OWENS, Secretary.
San Francisco, July 16, 1869. jy17

George Washington Silver Mining Company. White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the first day of July, 1869, an assessment of ten cents per share (or $1 per foot), was levied upon the capital stock of said Company, payable on the tenth day of July, 1869, in United States gold coin, to the Secretary, at the office of the Company, No. 10 Stevenson Building, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twelfth day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirtieth (30th) day of August, 1869, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Trustees.

THOS. J. OWENS, Secretary.
Office, Stevenson Building, San Francisco. jy10

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, Cal.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the tenth day of May, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. shares.	Amount.
Bridges, Mary C.	260	12½	$18 15
Senter, Riley	65	10	15 00
Clark, T R	375	10	15 00
Clark, T R	346	22½	33 75
Lane, E M	254	10	15 00
Phillips, Chas C	60	4¾	6 55
Vega, F de la	154	11	16 50
Jardin, Henry	188	5	7 50
Jardin, Henry	304	3	4 50
Jardin, Henry	330	12½	18 75
Jardin, Henry	331	5	7 50
Hepburn, James	116	5	7 50
Hepburn, James	154	5	7 50
Hepburn, James	217	10	15 00
Bolts, John	266	8	12 00
Hatch, F S	312	8	12 00
Cutter, R S	366	3½	5 25
Cutter, R S	384	10	15 00
Long, M	385	22 7-16	33 60

And in accordance with law, and an order of the Board of Trustees, made on the tenth (10th) day of May, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., auctioneers, No. 426 Montgomery street, San Francisco, on Wednesday, the fourteenth day of July, 1869, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. CROWNINSHIELD, Secretary.
Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. jy5

POSTPONEMENT.—The above sale is hereby postponed until Monday, the twenty-sixth day of July, 1869, at the same hour and place. By order of the Board of Trustees.

jy17 J. CROWNINSHIELD, Secretary.

San Fernando Tunnel and Silver Mining Company, White Pine Mining District, State of Nevada.

NOTICE.—The first Annual Meeting of the Stockholders of the San Fernando Tunnel and Silver Mining Company will be held at the office of the Company, on MONDAY, the second day of August, 1869, at 3 o'clock P. M., for the purpose of electing Trustees to serve for the ensuing year, and for the transaction of any other business that may properly come before the meeting.

GEORGE L. SMITH, Secretary.
Office, No. 16 Stevenson Building, corner Montgomery and California streets.
San Francisco, July 1, 1869. jy3

Sedgley Tunnel and Silver Mining Company. White Pine Mining District, State of Nevada.

The first Annual Meeting of the Stockholders of the Sedgley Tunnel and Silver Mining Company, will be held at the office of the Company, on MONDAY, the second day of August, 1869, at 1 o'clock P. M., for the purpose of electing Trustees to serve for the ensuing year, and for the transaction of any other business that may properly come before the meeting.

GEORGE L. SMITH, Secretary.
Office, No. 16 Stevenson Building, corner of Montgomery and California streets.
San Francisco, July 1, 1869. jy3

Thunderboldt Mill and Mining Company, White Pine, Nevada.

NOTICE.—The Annual Meeting of the Stockholders of the above named Company, for the election of Trustees for the ensuing year, will be held at the office of the Company, No 10 Stevenson Building, S. W. corner Montgomery and California streets, on FRIDAY, July 23d, 1869, at 4 o'clock P. M. Per order. THOS. J. OWENS, Secretary.
San Francisco, July 16, 1869. jy17

Thunderbolt Mill and Mining Company, White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the first day of July, 1869, an assessment of five cents per share (or $1 per foot), was levied upon the capital stock of said Company, payable on the tenth day of July, 1869, in United States gold coin, to the Secretary, at the office of the Company, No. 10 Stevenson Building, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twelfth day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirtieth (30th) day of August, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

THOS. J. OWENS, Secretary.
Office, Stevenson Building, San Francisco, Cal. jy10

White Cloud Tunnel and Silver Mining Company, White Pine Mining District, State of Nevada.

NOTICE.—The first Annual Meeting of Stockholders of the White Cloud Tunnel and Silver Mining Company, will be held at the office of the Company, on MONDAY, the second day of August, 1869, at 2 o'clock P. M., for the purpose of electing Trustees to serve for the ensuing year, and for the transaction of any other business that may properly come before the meeting.

GEORGE L. SMITH, Secretary.
Office, No. 16 Stevenson Building, corner of Montgomery and California streets.
San Francisco, July 1, 1869. jy3

Yosemite Mining Company, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of July, 1869, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, San Francisco.

Any stock upon which said assessment shall remain unpaid on the seventh day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-fourth day of August, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

ISAAC P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, fuel saving, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.

San Francisco, May 1, 1868. 18v10tf

CALIFORNIA BRASS FOUNDRY.

No. 125 First street, opposite Minna,
SAN FRANCISCO.

ALL KINDS of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

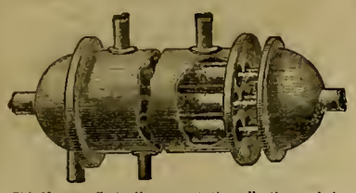
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, **220** Fremont street,

1v1 San Francisco.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

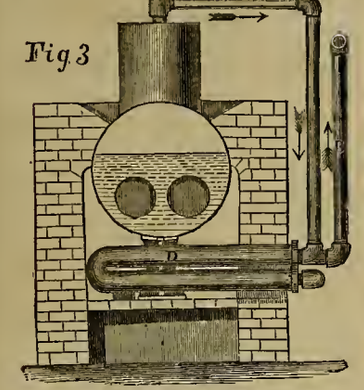
REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,
16v18-3m Patentee, Sacramento, Cal.

Important to every one using Steam for any purpose.

CARVALHO'S
Patent Steam Superheater



[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1869.
"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after *seven* years of service.)
"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.
"Superheater saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.
"Superheater saves 20 per cent. of coal, less steam pressure, exhaust more serviceable in drying paper."

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.
"Superheater saves not less than 20 per cent. fuel; no priming!"

CROCKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.
"Superheater economizes 25 per cent fuel; does our work with 23 lbs. less pressure steam, and steam superior for drying purposes."

N. Y. DYEING & PRINTING ESTAB., Oct 4, 1867.
"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINUOUS OIL REFINING CO., Binghampton, N. Y., Sept. 20, 1867.
"Superheaters give entire satisfaction, and we superheat to 55° deg—an increase of 20° deg."

CAREW MINING CO., So. Hadley Falls, Mass., Oct. 17, '67.
"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867.
"Superheater saves at least 25 per cent in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867.
"Superheater saves 25 to 30 per cent. in fuel; no priming"

CONTRA COSTA LAUNDRY, Oakland, July, 1868
"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAVILAH M. CO., Cal., August, 1868.
"Superheater causes a use of 40 lbs. steam instead of 60 lbs.; use much less water, and there is a saving of fuel." (2 sets.)

SIXTH MECHANICS' INST. FAIR, S. F. Sept. 4, 1868.
"Superheater used proves that it saves fully 30 per cent. in fuel" (Chief Engineer.)

NEVADA MILL, Virginia City, May 20, 1869.
"Superheater is a perfect success, and saves three cords of wood in ten, or 33⅓ per cent. in fuel; engine works better."

And many other letters of the same tenor.

Awarded Silver Medal, Mechanics' Institute, San Francisco, 1868.

Awarded Silver Medal, Maryland Institute, Baltimore.

Awarded Silver Medal, American Institute, New York, 1865.

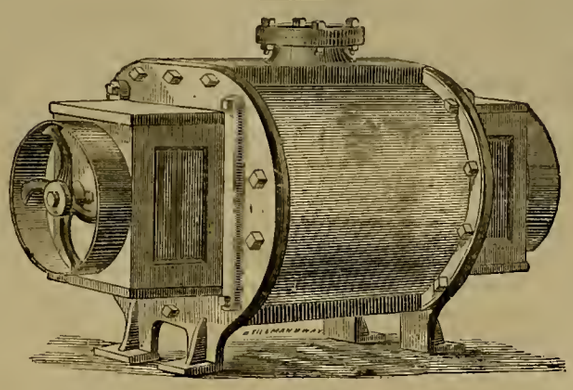
Send for Circular to ÆTNA IRON WORKS, San Francisco, California. R. DAL. L. HARRIS, Agent.
JOHN L. CONSTABLE, Engineer. 20v18tf

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

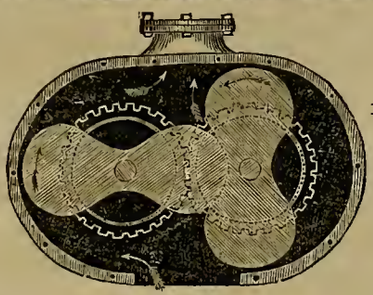
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 21, 1868; and Oct. 6, 1868.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

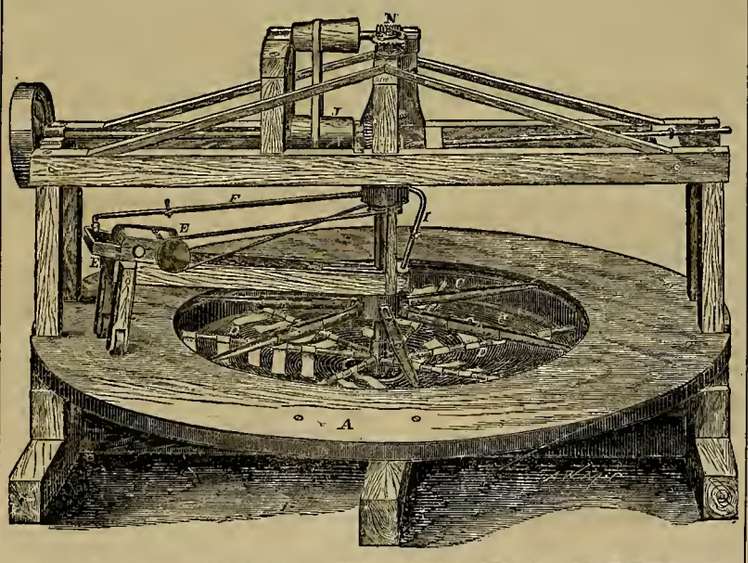
Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

KEEP & BARGION,
4v16 3m **Globe Iron Works, Stockton, Cal.**

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Bannor Co's mill near Nevada, and see for themselves.

CERTIFCATES:

GRASS VALLEY, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.
WM. L. TISDALE, Supt. Star Spangled Banner Mine.

NEVADA CITY, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

REBELLIOUS ORES.

THE HAGAN FURNACE.

The above method for the purification of Rebellious Ores is respectfully offered to the public. Repeated actual workings show that the

HAGAN FURNACE

Will accomplish all that the Reverberatory Process will do, and at an expense that is merely nominal. It has never failed to treat any ore effectually.

It has never been claimed for it that it will extract gold from ores which do not contain any of that metal.

Parties owning rich but refractory veins, can treat with the undersigned upon the basis of

GUARANTEED RESULTS,

With responsible security. For an interview, and all desired particulars, address

THE PACIFIC ORE CO.,
P. O. Box **1019**, San Francisco.
June 25 1869. 29v18-3m

RANSOME'S PATENT
Diamond Grit Grindstones,

Warranted of Uniform Texture,

TWICE AS STRONG AND WILL CUT AT LEAST TEN TIMES AS FAST AS THE BEST NATURAL STONES.

We manufacture the following qualities, viz:

"Hard," for Machinists, etc.
"Medium," for General Use.
"Soft," for Wood Workers, Etc.,

Diameters, 4 to 70 inches; thickness, ¼ inch to 12 inches; and any fineness required.

Solid Emery Wheels and Sharpening Stones,
Of all forms and materials.

These Stones are fast superseding the natural ones in England, the tests made there showing them to cut about fifty (50) times as fast as the Newcastle, and entirely free flaws, and hard and soft spots.

☞ Grindstones, with Frames, Iron Troughs, Shafts and Treadles, ready to set up in working order, for sale a wholesale or retail.

PACIFIC STONE COMPANY,
E. T. STEEN, Sup't.,

Information for Inventors and Patentees.

AN EXTRACT

From the American and Foreign Patent Agency Circular of the Mining and Scientific Press, Dewey & Co., Publishers.

Foreign Patents.

In addition to American patents we secure, with the assistance of co-operative agents, claims in all foreign countries which grant patents, including Great Britain, France, Belgium, the Netherlands, Prussia, Anstria, Russia, Spain, British India, Saxony, Sardinia, Norway, Sweden, Mexico, Victoria, Baden, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, British India, Wirtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Repnblic, AND EVERY COUNTRY IN THE WORLD where patents are obtainable.

Our schednle prices for obtaining foreign patents, in all cases, will he as low as those of any other reliable agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

Many valuable and important inventions of Americans are being yearly surreptitously patented in foreign countries, some of which governments allow it, thus deharring those who bave valuahle inventions from their rights.

Re-Issues.

When, through "inadvertence, accident, or mistake," an *insufficient* or *defective* patent has heen issued, the defects in the Specification and Claims can be remedied by a *re-issue*. In order to ohtain this, the inventor, or the holders of the patent, must snrrender the patent, and file an amended specification and drawings, and a statement specifying the ground for asking for a re-issne. Re-issues are generally applied for after it has hcen found that the patent could not withstand litigation. It is, therefore, especially desirahle that the new Specification and Claims should he prepared with great care and skill. Terms liberal in these cases.

Caveats.

A caveat is a description of the invention designed to he patented, lodged in the Patent Office before the patent is applied for, and while the inventor is perfecting his design. When *properly* made, it operates as a har to applications respecting the same invention from any other quarter; but when improperly done, it is inoperative hy reason of such defect. The Patent Office always returns a receipt for caveat papers, hnt does not seek to point out its incorrectness, unless there be some glaring defect.

Our fees for filing caveats are from $20 to $25. This covers the entire expense, including Government fee.

If worth filing at all, these cases should he prepared with very great care and eantion.

To enahle us to prepare eaveat papers, we only require a sketch and a full and comprehensive description of the invention.

No model is required in filing a caveat. For this reason, and the fact that tbe cost is much less than for an application for a patent, it is in many cases advisahle for American inventors to avail themselves of the privileges of our caveat system.

Unsuccessful Applicants

Who are not satisfied with the reference sent to them from the Patent Office, or are dissatisfied with the transactions of their agents, can have their eases thoronghly examined and reported on, hy sending us their power of attorney so to do, for a small expense, at most. This can he done without revoking the power of other agencies or in any manner prejudicing the intercsts of the inventor. Cases which have been resting a long time in the Patent Office have been successfully undertaken hy us to the great satisfaction of inventors. Parties who know themselves to he the first and true inventors of valuable inventions should not give up their chances, without investigation, simply hecause patents have heen wrongfully issued to others.

In Our Library

We have the only complete set of U. S. Patent Office Reports (from 1844) on this coast; a full record of all patents issued since 1790; Record of British patents from 1801, and full files of scientific papers containing illustrations and list of U. S. Patent Claims; Illnstrated Mechanical, Philosophical, and Law Books and Reports, of the very highest authority, forming the only extensive library of patent works west of the Rocky Mountains. We offer patentees and inventors the free use of these hooks at our office. The files of the MINING AND SCIENTIFIC PRESS contain the claims of the Pacific Coast Patents, and many illustrated descriptions of the same. We have also in our office *full copies* of a large majority of the patent cases emanating on the Pacific Coast.

☞Our Illustrated Pamphlet, from which the above is an extract, will he furnished free on receipt of postage stamp. Confidential advice given, and every legitimate branch of Patent Soliciting business promptly and faithfully executed, hy

DEWEY & CO.,
Publishers Mining and Scientific Press, 414 Clay street, San Francisco.

THE SUN-SPOTS ARE DEPRESSIONS.—Messrs. De La Rue, Stewart and Loewy, who have made numerous observations at Kew, consider that the sun-spots are cavities and at a lower level than the sun's photosphere. A spot observed on May 7th, in disappearing produced indentations in the west limb in two successive photograms. They prove that such indentations must under all circumstances be very rare occurrences.

"TIDAL WAVE" OFFICE, SILVER CITY, IDAHO TERRITORY, July 18th, 1869.

MESSRS. DEWEY & CO., *Patent Agents:*—Much obliged for the efficient manner in which you have conducted our business, etc. Yours, etc., JNO. S. BUTLER.

MINING AND SCIENTIFIC PRESS.—We are pleased to see that the proprietors of this valuable paper are taking active measures to increase their circulation in this State, for we are satisfied, from our own knowledge of the paper, that the more widely it is circulated the more understandingly will mining be conducted.—*Territoria Enterprise.*

AADRESS WANTED.—We are desirous of communicating with Allen Oliver, lately of Jamestown, Tuolumne County, California. tf

RETURNED.—Dr. J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17 4m

PHOTOGRAPHY.—FOR CABINET PROTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfactioa.
10v18 6m B. F. HOWLAND.

DR. HALL has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, Fraace and Germany, and has held consultations with the following eminent physicians: Drs. Carling, Druit, Lee, Parker, Actoa, Aitken, Charchill, Ricord, Velpean, Boech, Sperino, and Dewilz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18 3m

Cholera—How to Cure It.—At the commencement of the diarrhœa, which always precedes an attack of the cholera, take a teaspoonful of the Pain Killer in sugar and water (hot if convenient), and then bathe freely the stomach and bowels with the Pain Killer clear. Should the diarrhœa or cramps continue, repeat the dose every fifteen or twenty minutes till the patient is relieved. In extreme cases two or more teaspoonfuls may be given at a dose. The Pain Killer, as an internal remedy, has no equal. In cases of Summer Complaint, Dyspepsia, Dysentery, Asthma, it cures in one night by taking it internally, and bathing with it freely. Its action is like magic when externally applied to Bad Sores, Burns, Scalds, and Sprains. For Toothache, don't fail to try it. In short it is a *Pain Killer.*

The Pain Killer is sold hy all Druggists and dealers in Family Medicines.

REDINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents. jylm

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucibles:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co.,: 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and conceede your claims for them. We think they will average 45 pourings of brass. GALLAGHER, WEED & CO.,

California Brass Work, 122 Fremont, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheappness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at **11** o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **10th, 17th** and **30th** of each month that has **30** days.

On the **10th, 18th** and **30th** of each month that has **31** days.

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 17th falls on Sunday, they will leave on the Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departure of the 17th or 18th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

The following Steamships will be dispatched on dates as given below:

July 9—GOLDEN CITY.....Capt. Wm. F. Lapidge,
Connecting with ALASKA, Capt. Gray.

July 17—MONTANA.....Capt. E. S. Ernsworth,
Connecting with HENRY CHAUNCEY, Capt. Connor.

July 30—COLORADO.....Capt. Wm. H. Parker,
Connecting with ARIZONA, Capt. Maury.

Passengers berthed through. Baggage checked through. One hundred pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets to Liverpool by the "Inman" and "National" Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holder of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship GREAT REPUBLIC, Capt. Cavarly, will be dispatched for YOKOHAMA and HONGKONG on SATURDAY, July 3d, 1869, at noon connecting at YOKOHAMA with the steamer NEW YORK for SHANGHAI. Shippers of freight to China or Japan are requested to mark on each package its destination.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.
OLIVER ELDRIDGE, Agent.

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL, are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address DEWEY & CO., Mining and Scientific Press office San Francisco.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Foundry Work—Mining Machinery for Japan.

Notwithstaading the dull times, and scarcity of money, which is operatiag so disastrously with one or two of our foundries and with husiaess operations, generally, throughout tho city, we notice coneiderable activity in most of the shops, oae of which, the Vulcan, has just completed an order of a most interesting and suggestive character—nothiug more nor less than a completo quartz mill for Japan. Who can eay after this that the Japanese are not progreesiag? The Vulcan Foundry has just shipped a 10-stamp mill with amalgamating appliances complete. The motive power will be a large overshot wheel, which the Japanese are now buildiag, tbemselves, at tho mine. The process to be employed is a dry one. The ore, after leaving the hatteries will be further reduced in amalgamating barrels, of which fivo are furnished, weighiag 1,175 pouads each. The battery is a most suhstantial oac, with iron columas and head pieces; iroa beiag used everywhere so far as practicable. The machiaery was all set up and proved before beiag shipped. The two hatteries, of five etamps each, weigh ahout ten tons. The weight of tbe eatire shipment is about thirty-five tons.

During the week, tbe Risdon Iron and Loccmotive Works have shipped, for Virginia City, a numher of ore cars for the Virgiaia and Truckee Railroad Company, wbich road is now nearly complete. The boxes of these cars are built of one-sixth inch boiler iron; haviag doors in the bottom through which to dump the ore.

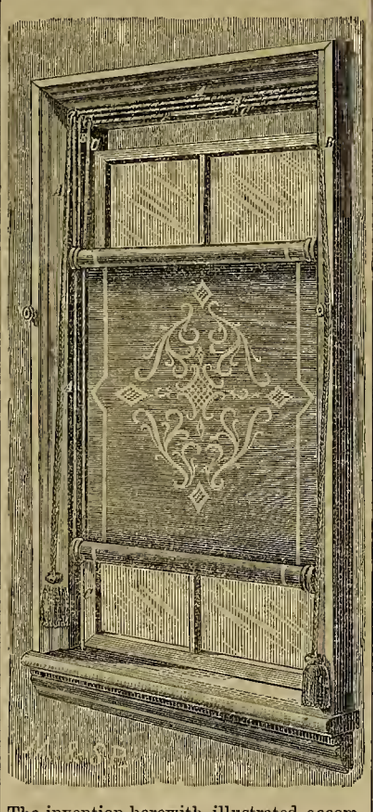
A large amount of machinery has also gone forward within a few days for the Coasolidated Chloride Co. of Hamilton, White Pine, Nev.

PENSION AGENCY.—Mr. H. C. Bennett, of this city, who was some time since appointed Government Ponsion Agent for this coast, has received bis commission, and estahlished his office over Loomis' newspaper depot, corner of Washington aad Sansome streets, whero he is prepared to pay those eutitled to receive pensions in eitber the Army or Navy Departmeut. The establishment of such an agency on this coast will be fouad a great conveaience to those intcrested.

Tay's New Device for Hanging Window Shades.

We give herewith an illustration of an improved device for hangiag wiudow shades, whereby a certain arrangemeat of cords, rollers and weigbts, enables a person to roll a curtaia down from the top or up from the bottom, as may be desired, and so that either the top or bottom of the curtain may he made to remain at aay desirod position on the wiadow.

Maay people have long felt the necessity for some practical aad easily managed device by which light and air may be admitted into a room from eitber the top or bottom of a window, or hoth, as may be desired.



The invention herewith illustrated accomplishes this, and most admirably. By simply toucbing witb a slight lift or pull the weighted tassel upon tbe rigbt, tbe upper portion of the curtain may be lowered or raised, aud will be held in any desired position hy tho weight and couater-balance of tbe tassel. The lower portion of the curtain may be manipulated in the same manner by handliag the tassel upon the lcft. No *fastening* of the cord is required after it is once adjusted.

By this arrangement there is no blowiag in or blowing out of tho curtain in consequence of the loweriug or raising of a window sash. The entire curtain may be placed directly opposite the portion of the window occupied by the sash; or it may all be rolled up and snugly placed at the top. A curtain is here presented which is perfectly adapted to every possihlo want of such a conveaience; not suhject to deraagement of its manipulatiag cords, and entirely free from unpleasaat thrashiag and blowing to which all ordinary curtains are subject. It is applicahle to auy kind of curtaia material, is so eimplo as to be easily manipulated by aay child, and is no moro costly than most of the styles of fastenings in general use.

Although the patentee has not yet offered the fixtures for sale publicly, he has reccived several orders for public and private huildings from various parties who are very desirous of obtaining them, and who seem to repeat the saying, "we can't keep house without them."

Further information may be obtained at tbis office, or on application to the iavontor, Mr. John I. Tay, Oakland, Cal. Tbis important invention has recently heen patented through the MINING AND SCIENTIFIO PRESS PATENT AGENCY, aud is well worth the attention of manufacturers, housekeepers, and all persons engaged in finishing or refurnisbing dwellings or houses of any descriptioa. It may readily he substituted for aay curtain now in use.

PERSONAL.—We understand that Prof. George J. Brush, of tbe Sheffield Scientific School of Mines of Yale College, is about to start on a tour of observation through tbe mines and metallurgical works of Colorado, Nevada and California. Prof. Brush has probably done more than any other man connected witb the faculty of that institution to make it what it is—the foremost scientific school in America. In connection witb his associates, he has been doing honest, solid work in huilding up a school for the benefit of the whole country. We are pleased to learn that he is coming to look at our miaes and our various leading iadustrial establishments. Such observations will no doubt give him a more appreciative idea of our resources and industrial wealth, and enable him to more fully and faithfully represent us in tbe world of letters and industry at the East.

GROWTH OF CHICAGO.—Chicago has now a population of 300,000, and does more business than any European city with twice that number of iahabitaats. Less than oae-third of the territory directly dependent upon that city is yet cultivated, and the iacrease in the cultivation of that now occupicd will eveutnally be greatly increased by closer and more improved farmiag; so that the opportunities for the future growth of Chicago, based alone upon the agricultural resources of its dependencies, is almost beyond computation. Nothing nced bo said of the immense results which must come froa the great and growing manufacturiug interests of the Great West. Chicago is and must ever he on the lino of the great iron highway between San Francisco and New York, and must, moreover, be the chief central radiating poiat of that highway of nations. She is now, aud will ever remain, tbe queen city of the great iaterior hasin of tbe North American Contineat.

Burning Harvesters.

Au improved harvester was invented eome timo since hy Mr. John M. Horaer, of Mission San Jose, by which a great saviag of labor is effected. This harvestor cuts, thrashes, and sacks the graia, at one operation. Three of these machines have been actively eagaged in the field, this season, against the best class of reapers, headers aad steam thrasbers ia tbe State. It ie said that they have demonstrated to the most critical observers that they are fully able to accomplish all that has been claimed for them. Sixteen acres can be harvested by tbis machine in one day.

This success, which it was thougbt would have heen hailed by all men with delight, seems to have produced quite a different feeling upon the hands engaged in farm work in the vicinity; and various threats were thrown out to the effect that such machines should not be allowed to work, etc., because they interfered with the demand for labor. But little attention, however, was given to such threats until the 14th instant, when one of the machincs was coneumed in the night, and under circumstances which rondered it all but couclusive that it must have heen set on fire by somo of the parties who had heen tbreatening or prophesying violence. It is to be hoped that the parties who could be guilty of such an act may be found aad punished, in order that villainy may have its reward and tbe iunocent be freed from suspicion.

Such acts, taken in coanection with the late high-handed proceediags in San José, Grass Valley and Wbite Pine, may well set sober men to thiaking upoa what evil times we may bave fallen. When men are banding together to subvert the principles of justice and right, or when men are forming associations whose influence leads directly and naturally to such results, is it aot time that those whose lives and property are thus jeopardized should take some nnited action to protect themselves against eucb attacks?

STRANGE OVERSIGHT.—The Grass Valley *Union* very properly alludes to tbe fact that of all the sigbt-seeing by our Chicago aad other friends, who are now visiting the Pacific Coast, to examiae and ascertain its resources, not oae has yet visited the mines of tbat place. This oversight is certaialy remarkable, especially when they all pass witbin ten miles of tbe town, in wbich are located some of the most extensive gold mines in the world. Not to see Grass Valley, is to overlook ono of tbe most remarkable and important localities in California.

VALUE OF SAFETY CAGES.—Two or three cables connected with the hoisting apparatus in the Virginia City miaes, have broken within a few weeks, but without any furtber damage than tbe mere partiag of the ropes; as safety cages were used ia each case, which arrested the fall of the same almost instaatly. Had it not been for such an arrangement, in oao case at least, serious loss of life must have eusued.

Communications.

An Interesting Ore Deposit in Plumas County.

[Written for the Mining and Scientific Press.]

Editors Press :—One who has spent all the years of his manhood in Plumas county—most of the time for twenty years as a practical miner—and who desires to see that county emerge from the cloud under which she has been laboring for some years, owing to her lack of energy, hopes that the following description of a mine in this county may arrest the attention of some of those who look upon this branch of industry not only as a source of profit but also as a science. This mine, in which I have no personal interest, is located at the head of Greenhorn Gulch, a feeder of Spring Garden creek, which empties into the east branch of the North Fork of Feather river just below the point where Spring Garden creek and Spanish creek emerge from the American Valley into the cañon.

Early miners in Plumas will remember Greenhorn Gulch, lying on the south slope of the mountain, the Spring Garden Ranch and Grizzly Valley—on the old emigrant road—and others may be more familiar with it by describing it as being a mile or so above the mouth of the old "North American" tunnel, on Spring Garden creek, which mine set all the county agog with astonishment at the wonderful promises made by Mr. J. R. Sproul, whose residence in San Francisco has proven that his hallucination on that subject was owing more to a disordered state of mind than an intention to deceive.

At the very head of Greenhorn Gulch there has long been much prospecting, from the fact that that creek itself paid so rich in the early days; and it is only now, when the hillside has been thoroughly prospected and laid bare in spots for a distance of over 4,000 feet, that the secret of its richness has been discovered.

Standing in the gulch, with your back to the east, you see a semi-circular hill rising at an angle of about 30°. Directly in front is a prospecting cut; but you see none of the signs sought for by the miner, except thin veins and strata of decomposed quartz—which you will find increasing in size and quantity as you travel from the left to the right—and at intervals of four hundred or five hundred yards you will find the hill prospected, not only to the bedrock, but also down into it for forty feet or more—the dirt and rock having paid thus far at the rate of about $20 per day to the hand. But on examination it is found that what they term bedrock is filled with sulphurets, which (rock and sulphurets pounded together) assays from $7 to $20 per ton. This rock is as easily worked as so much gravel; still immense masses of it have been carried away, until they have become satisfied that they send down in the uncrushed rock, through their sluices, infinitely more gold than they save. Millions of tons have thus been swept away down the creek. Latterly a dam has been constructed, which has already saved about 2,000 tons, with a capacity for a million.

These thin seams of quartz, varying in width from an inch to a foot, all dip into the hill, on the right-hand side of the semi-circle, where they seem to unite in the mother vein, upon which they have sunk only about seventy-five feet, but with splendid prospects, developing a vein over five feet in width. The main vein runs south 15° east and north 12° west; and a compass laid upon it in its direction of length cuts directly across the Eureka and Mammoth lodes, on Jamison creek, Plumas county, and also the mines known as the Sierra Buttes, in Sierra county.

The mystery of this claim is the immense deposit of gold in the bedrock, which the miners here call talcose slate, but which is not what used to be called talcose slate on Oregon Cañon, and on Cañon creek in El Dorado county, nor on Deer creek in Nevada county. It is more like a porphyritic formation—yellow, greasy to the touch, and somewhat laminated, like slate, yet filled with innumerable sulphurets, which are undoubtedly gold-bearing.

Enough of the ground has been prospected to show that there is at least a half mile in length, with a width of 4,000 feet, which will pay immensely by hydraulicing process, to say nothing of the immense wastage in the rock which goes through unbroken. There is ground enough already discovered to employ 200 men twenty years on the surface, and wealth untold to an unknown depth.

The mine is known as the Freeman and Heath claims, 2,000 feet, and from their line to the eastward it is known as the Krusely and Dneder claims, worked at present by Messrs. Kelly and Archer. A plentiful supply of water—over 500 inches—the year round, can be had. We call the attention of capitalists and mining experts to this, as an anomaly in all mining heretofore known in California. If there is any certainty in the judgment of the value, by the prospects already done, it is certain to be as valuable as any of the hydraulic claims in this State, and will richly reward those who add to their capital a little energy and mining sense. Forty-niner.

Quincy, Plumas Co., July 5, 1869.

Let the Inventor be Protected.

"Nothing is more common, on the publication of a new discovery or invention, than to express surprise that it was not thought of before. Yet thousands of clever men had gone on, generation after generation, in the industry to which the invention applies, without having once thought of it, or, having possibly thought, reduced it to practice. * * * The theory is maintained by those opposed to patents that, for every successful invention, a number of inventors were on the road, each of whom would certainly have reached it in time. They speak of the common laws of nature, and natural principles common to all, as if there were any pretense that these were, or had ever been, considered as subjects for patents. The idea that a single broad field for improvement, which had existed and been recognized for generations, should almost at once, or within say one, two, or five years, engage the attention with a like result of perhaps half-a-dozen or a dozen independent and really competent inventors, is sufficiently improbable on its face, and is only matched by the piece of pure assumption which asserts it as a fact. The assumption is not so much in the notion that a number of inventors may have applied themselves all at once to the same subject, but in the notion that all would be successful, and, still further, that all would accomplish the same end by the same means. There is nothing to argue upon in such a statement. It possesses neither proof nor probability and that is all that can be said of it. * *

Genuine and useful invention, so far from being obvious at first sight, is much more commonly treated with doubt, and sometimes with ridicule. The thing which it is pretended almost any one might have invented, is generally contemptuously received by the great aggregate inventive talent which is supposed to have been all along so full of the same idea. * * So far from voluntarily adopting the more important inventions at first, experience has shown that in by far the greater number of cases the public require much canvassing and persuasion to induce them to take up an invention at all until its success has become well and widely known."—*Engineering.*

The Age of Paper.—The invention of paper collars and paper bonnets seems to have opened up a world of discovery. It has fairly inaugurated an age of paper. The cheating cups of the restaurants led to the invention of coffee-proof paper cups of honest capacity. Some Yankee is now making them. They fold up, and are carried in the pocket. They are so cheap that after once using they may be thrown away. Hats are made of paper on similar principles; and we hear of paper stockings. Ladies' skirts are now made of paper, and sold for sixpence, in England. School globes, on account of their rotundity, would be thought incapable of close packing, but they are pocketable now. A Vermont genius is making them of tough paper, so that they fold up into small compass. They have internal steel springs, which open out, and in an instant present a perfect geographical globe. By and by some daring inventive genius will devise a paper Avitor, and steam away in it to the uttermost parts of the earth.

Molasses in Bulk.—The Boston schooner Novelty, built with iron tanks for carrying molasses in bulk, has recently arrived from Cuba on her first trip. The experiment was a most successful one, saving on the cargo of 84,000 gallons $2,000.

Familiar Science.

Telescopes and Telescopic Vision.

A good telescope, with a three and a half-inch aperture, virtually brings the moon within 1,200 miles of the observer. Lord Rosse's telescope brings it within 42 miles, so that objects 270 feet long are discernible. An instrument of ten times the power of Rosse's would bring the moon within a mile, at which distance the body of a man might be perceived, and a large building very minutely examined, and its exterior described.

Some of our readers may be curious to know why it is, if we can bring objects upon the moon to within a range of 42 miles, they cannot, by increase of telescopic power, be brought within one mile. The difficulty in the way is the enormous augmentation of power which would be necessary. It would require at least *ten times* the power of the Rosse instrument to bring the moon 40 miles nearer the earth than it can now be brought; moreover, this very increase of power defeats one of the requisite conditions to the end desired—clearness of observation. The vibratory motions caused by radiated and reflected solar heat, and the mechanical impurities suspended in the atmosphere of the earth, are all hindrances to clear observation; and the higher the power employed, the more formidable these hindrances become. These obstacles will undoubtedly be, at least in part, removed; but *how*, it is difficult at present to understand.

Preservative Properties of Whitewash.—Sheet iron of any kind, if covered with a thick whitewash of pure lime, will not rust, though exposed to weather however damp. Gas and water pipe, thus whitewashed and remaining under ground for years, has been found to be entirely free from corrosion. It is said that peaches and pears, which under ordinary circumstances would decay in three or four days, when thus coated may be kept for as many weeks. The wash may be easily removed without any injury to the fruit. Where it is especially desirable to keep choice and perishable fruit for the time mentioned, such a method of preservation might be found of much value.

How to Soften Sponge.—The sponge, when first taken from the rocks, consists of a heavy, black-looking mass, with a very offensive odor, and seemingly anything but that which can be changed to a useful and cleanly substance. In order to remove the impurities, it is first buried in the earth for two or three weeks, at the end of which time the organic matter will then have become decomposed, and most of the effluvia will be removed. By a little washing it can now be made clean and soft—a pure fibrous skeleton. To prevent its becoming hard and rough to the touch, immerse it for a few moments in warm water, containing from ten to twenty per cent. of glycerine; after which, when squeezed dry, it will be found soft and elastic.

Why do we Oil our Whetstones.—We oil our whetstones for several reasons. The first is, that almost all stones, unless oiled, become glazed or burnished on the surface, so that they no longer abrade the metal. The second reason is, that most stones, after being oiled, give a finer edge than they do in a dry or merely wet state. The pores of the stone become in a measure filled up, and while the action is rendered continuous, its character is altered. A dry stone is very apt to give a wire-edge to a tool, and although this sometimes happens when oil is used, yet it does not occur nearly so often. Some stones work better with water than oil.

It has been said that a little carbolic acid dissolved in the water which is used to moisten a whetstone, or a grindstone, will greatly increase the friction, and thus promote the action of the stone upon the steel instrument. If this be true, and there be no unforeseen drawback, carbolic acid will prove invaluable to all who have to sharpen tools or grind metallic surfaces.

How to Detect Escaping Gas.

We last week gave full instructions for reading gas meters, so that every consumer may be able to ascertain from his own knowledge, the amount of gas which he is using. We now give, from the same source—the N. Y. Gas Light *Journal*—some hints of the manner in which one should proceed to detect escaping gas:

If your gas bills seem too high, or you have the evidence of escaping gas by sense of smell, but not positively so, take a reading of the meter when no burners are in use, and after an hour or so repeat the reading, and if the gas is escaping it will be shown. To detect the locality of the leak is often a more difficult matter. The first thing is to see that no burners have been left turned on by accident, which is often the case where the cock has no *stop*, and is caused by the cock being turned partially round again so as to open the vent. Imperfect stop cocks are for this reason dangerous, and should be at once removed.

The next thing to do in order to detect a leak is to try the joints of the gas fittings. The sense of smell will frequently be sufficient by bringing the face near the suspected joint; a lighted taper or match held near the joint is a more certain plan. If gas is escaping it will take fire at the leak, or if too little to burn steadily it will momentarily catch and extinguish in little puffs.

Sometimes the gas escapes from the joints or imperfect piping between the ceiling and floor, or behind the walls or casings.

If beneath the floor the sense of smell will generally detect the section of the floor under which the leak is: as it escapes owing to its levity upwards through the crevices of the floor, and penetrates the carpet if there be one. If bracket or side burners are used, and the escaping gas is behind the walls or casings, the crevices in the casings, or the opening when the pipe enters the room, will let the escaping gas enter the room sufficiently at these points to indicate somewhat nearly the location of the leak.

In such cases the proper course is *never* to apply a light to the crevices or casings, but to turn off the gas at the meter and send for a gasfitter, otherwise an explosion may occur involving serious consequences. In ordinary leaks of gas fixtures and pipes, whether at the joints or at the attachment of the burner, the fitting or burner should be unscrewed and white lead or common bar soap rubbed in the threads, and then screwed home again. This can be done often without any aid from a gasfitter.

Sunstroke.—Sunstroke, like hydrophobia, is always a doubtful subject as to what it really is, and how caused. The forms of medical treatment in the case of sunstroke are as varied as the theories advanced of the character of the malady. Says the N. Y. *Mining Journal.*

In England, such cases are considered as arising from direct over-heating of the blood, and treated accordingly. At home doctors consider it a poisoning of the blood, and follow a treatment analogous to that in snake poisoning. Indian doctors believe that sunstroke is occasioned by the direct action of the sun's rays upon the hair, or perhaps upon the *medulla oblongata.* But how is this effect caused? What rays of the sun thus affect? It cannot be illuminating rays, nor can it be the heat—for firemen, puddlers, glass-blowers, etc., endure much greater heat, and at still greater disadvantage. But in the solar rays we have the "actinic" or chemical rays, and it is the actinic which acts most powerfully on organic nature, and the actinic rays are surpassingly energetic in the tropics.

The Aurora and the Telegraph.—The electric currents produced in telegraph wires by the Aurora Borealis has been estimated by Latimer Clark, an English electrician, to be equal to that produced by many hundred battery cells. Mr. Varley, of the Atlantic Telegraph Company, measured some currents between London and Ipswich in the fall of 1866, which required a current from 140 Daniell cells to neutralize them.

Never enter a sick-room in a state of perspiration, as the moment you become cool your pores absorb. Do not approach contagious disease with an empty stomach, nor sit between the sick and the fire, because the heat attracts the vapor. Preventives are preferable to pills or powders.

Mechanical Progress.

The Spiral Pump.

Wilfrid Airy, a son of the English Astronomer Royal, and a mathematician and mechanician of high standing, has published a work upon this machine, which is reviewed and illustrated by *Engineering*. That journal pays a high compliment to Mr. Airy in saying that one reason why this remarkable machine,—which was invented more than a century ago, yet of which only four working specimens have ever been constructed,—has made so little progress, is, "that the theoretical investigation of the principle involved is of a very complicated nature. It adds, that Mr. Airy has evidently made himself master of it.

The pump is thus constructed:

"A metal pipe is coiled round a cylindrical or conical drum, which is placed with its axis horizontal; this drum is carried by means of two axial pivots; one, a solid gudgeon running in fixed blocks, and carrying on its end a crank, by means of which the drum can be turned; the other, a strong pipe leading into the curved end of an upright pipe, in which it turns by means of a water-tight joint; one end of the metal pipe on the drum is left open on the drum, while the other end is led into the side of the horizontal pipe gudgeon above described, and soldered to it at the joint."

If the machine be erected at the surface of a reservoir of water, and so placed that the drum is more or less immersed, then, as the drum is turned, the open end of the pipe that is coiled on the drum takes in a portion of air and a portion of water at every revolution; and when the drum has been turned as many times as there are coils of the pipe upon it, then the pipe is full of these fluids in regular order, the water in each coil lying at the bottom of the coil, and the air at the top (the quantity of each depending upon the depth of immersion of the drum). If now the drum be still turned, the water and air in the last coil are discharged into the horizontal pipe gudgeon of the machine, and by it into the vertical pipe; and at every additional turn of the drum an additional discharge of air and water takes place into the vertical pipe.

An ingenious and beautiful application of the principle is made by substituting mercury for the air. "By means of a very small quantity of the mercury, made to circulate through the coils, a continued stream of water is lifted to a considerable hight."

The advantages of this apparatus,—says Mr. Airy,—are numerous and important. Its chief recommendation lies in the simplicity of its action, and the fewness of its parts; there are no sliding valves or other moving pieces liable to expensive repairs, and the one water-tight joint is simple, safe, and easily renewed without skilled labor. The friction may be reduced to a very small amount, for since the drum is always more or less immersed, it will be proper to make the drum hollow and water-tight, so that by proper adjustment of its size, weight, etc., it shall float in the reservoir without bearing at all on the gudgeons.

CEMENT FOR STEAM JOINTS.—A book to be shortly published by Van Nostrand, of New York, has the following receipt for a steam-joint cement, long used in France, and said to excel all others:—"Take white lead, ground in oil, a sufficient quantity. Add dry red lead enough to make a stiff putty. Put the mass in a mortar or on a block of iron or smooth stone, and pound it till it becomes soft; continue to add red lead, and pound until the mass will no longer become softer by pounding, nor stick to the fingers. At this time it should be of sufficient tenacity to stretch out three or four inches when pulled, without parting. The more protracted the pounding, the softer, finer and more tenacious the cement becomes. Interpose this putty between the flanges of steam pipe joints, taking care to put a thin grummet of packing or wicking around the diameter of the bore, to keep the cement from squeezing through when the flanges are screwed together. It is indestructible by steam or water, and makes the best joint known to the engineer."

Progress in Marine Engine Construction.

We condense the following from *Engineering:*

The grand old side-lever engines of twenty years ago, or for that matter ten years ago, are fast becoming curiosities possessing a high degree of archæological interest. It will probably not be long before the 100-in. cylinder, 12-ft. stroke engines of the Scotia, only finished in March, 1862, will be replaced by screw engines, as has been done already in the case of the Persia.

In 1847, there were many who disbelieved in the screw altogether, and its introduction into war ships was partly if not greatly due to the circumstance that the screw engine and propeller could be kept wholly beneath the water line, and that the deck was left clear for its whole length for armament. As for merchant steamers, it was long before steamship owners would listen to any arguments in favor of the screw.

With injection condensers, and the old forms of fire boilers, steam of more than 10 lb. per square inch was considered out of the question at sea; expansion was seldom practiced to any extent, and superheating was reckoned a costly and needless refinement, if, indeed, it had been thought of at all.

Marine engine improvement has consisted in doing just what twenty years ago was reckoned impracticable or inexpedient. The tubular boilers that were to give so much trouble by salting and leaking are now in universal use, and a flue boiler of 1850 would be reckoned a curiosity. The pressure of steam has been carried to 25 lbs. or 30 lbs. in regular work, while boats are worked to 50 lbs. The piston speed has been carried, as a maximum, to 600 ft., and even 650 ft. per minute. Superheating is now practiced with advantage and a good degree of expansion attained, in some cases with compound, or high and low pressure engines. Surface condensation, with all the cost, weight, and bulk of the tubes, and the difficulty, once encountered, of keeping them tight, as well as the danger, at one time so imminent, of corroding the boilers, is now a firmly established fact. Double-acting air pumps, making 75 double strokes, and 600 feet of bucket per minute, work as easily and silently as the old air pumps, worked, off the beam or side lever, at 80 ft. or 100 ft. with only 15 or 20 double strokes per minute. The dynamic performance of large screws of fine pitch is in all respects equal to the best results obtained from paddles, while the machinery required to drive it is far lighter.

"ROSSING" TAN-BARK.—The "ross" is the outer portion of the bark and is worthless for the tanner's purposes. The *liber*, or "meat," is the central portion. The *Hide and Leather Interest* says a new machine has been devised for separating these different parts of the bark; thereby not only saving the tanner the expense of transporting the ross, but also giving him a tan liquor which is improved in quality, it being freed from the gummy matter which that portion has heretofore contributed. The machine may be gauged to cut at any desired thickness. In the trial which was made, hemlock bark an inch and a half thick was used, being divided into three equal parts, viz: the inner, the central and the ross, or outer portion. Each of these was tested separately for tanning calf-skin. The first in about three weeks gave a leather well tanned and equal in color to that made of oak bark; the second, an article much darker and not quite half tanned; and the last, a product almost black and not tanned at all.

INDEPENDENT SAFETY VALVE.—The Pennsylvania Railroad has applied the new valve to all its engines. It is entirely out of reach of the engine driver, and lets off steam when the pressure rises to 120 pounds to the inch.

Scientific Progress.

Phosphorescence of Gases.

Some interesting experiments have been made by M. Sarrazin, a young French chemist, on the production of phosphorescence in gases by means of the electric spark. The gas to be experimented upon was introduced into a wide glass bell-jar, which was then exhausted of air to a certain pressure, and the charge then passed through it. Among simple gases, oxygen only is phosphorescent. A pale red light appears in the center of the vessel, surrounded by a beautiful greenish halo. This appearance is due to the production of ozone, since when one of the electrodes is sprinkled with powdered silver in order to absorb the ozone as fast as formed, the phosphorescence disappears. In the case of compound gases, those containing no oxygen are not phosphorescent, while those in which oxygen exists are so, the phosphorescence being due here also to the formation of ozone. The most striking effects are produced by nitrous oxide to which a little fuming sulphuric acid has been added, to increase the effect, by increasing the amount of ozone. Under these circumstances, the phosphorescence obtained is quite wonderful; the yellow gleam which remains after the electric discharge ceases, being sufficiently intense to illuminate a large hall.

Total Ultimate Refrigeration of the Earth.

The following is part of an article in the Yale *Courant*, by Prof. Alexander Winchell of the University of Michigan:

"Our earth is approaching a state of total refrigeration. Buffon asserted that this event would render its surface uninhabitable. Laplace, on the contrary, by proving that the sidereal day has not diminished perceptibly within twenty-five centuries, was thought to have proven that the earth has not undergone that shrinkage which the doctrine of gradual refrigeration requires. Poisson, while he demonstrated that heat is escaping from the earth, showed that the amount lost at Paris is only enough to elevate the temperature of a column of water eighteen inches high, one degree and a half. Vogt asserts that the existing temperature of the surface is but one-twelfth of a degree higher than it would be if the earth were cooled to the core. Pouillet states that the heat transmitted from the earth's molten interior is but one-fortieth of the amount received from the sun; while Fourier calculated that the same heat is only sufficient to melt a layer of ice ten feet thick in one hundred years. It may also be stated that Sir David Brewster, Sir William Thompson, Evan Hopkins and William Hopkins, have strenuously opposed the doctrine of internal heat, and these sentiments have been echoed, in America, in one form or another, by Messrs. Hunt, Shaler and Hall.

It is scientific to accept the admissions of such authorities as Pouillet, Poisson, Vogt, Herschel, Dana and Guyot, and argue from the assumption that the earth is gradually cooling. Nor are we wholly ignorant now of the means of explaining the anomaly presented by the constancy of the sidereal day; since the tide wave, actuated by the power of the moon, rolling around the earth in opposition to her diurnal motion, by friction against the shores and the standing waters opposes that motion. This retardation, it has been estimated, very precisely counterbalances, for the present, the acceleration which would be due to shrinkage, and thus preserves the uniformity in the length of the day.

* * * * *

Whatever may be the effect upon organic beings, of the ultimate cooling of the earth, the final exhaustion of the sun will dry up, irremediably, all sources of vegetable and animal activity.

However vast the time consumed in his cooling, the event is approaching with all the celerity and certainty which his power of radiation can effect. Planets and satellites which have sprung from his bosom have completed a history which, in the sun, we witness in actual progress. Our moon may be frozen to the core—our earth is a rigid shell enclosing the embers of an ancient fire—our sun is the residuum of a parent mass whose offspring populate the spaces of the solar system. His fires are still aglow because his mass is immensely greater than theirs. They are waning, however, according to the same law. While yet his store of light is inexhausted, and the lambent flames of burning hydrogen still leap from his disk, the lifetime of planets and satellites is passing. From age to age, the source of light and heat grows dimmer and feebler. There are intelligences who will gaze upon our orb a cold and blackened mass. It may be after the lapse of millions of years, but it will yet be in the morning of eternity.

What though a meteoric hail pelt the sun from every quarter, and excite his heat to renewed activity for a few thousands of years! Whence this shower of cosmical matter? It is not an infinite resource. It can only serve to postpone the reign of darkness and of universal winter—as friction may perpetuate for a few brief moments, the vital warmth of a dying man.

* * * * *

There was a time when the world was suited to nothing higher than molluscan and crustacean life. At another stage ichthyic organization and consciousness was summoned into being; then reptilian life; then mammalian; later, the life of an intelligence possessed of a moral consciousness and immortal hope. When we shall have utilized the passing phase of matter, progress will still rush onward in the same direction. The freezing globe will roll cold and lifeless about a frozen, blackened sun; and while, in some region of the universe, intelligences will still reside, our system will become an ancient wreck."

A NEW FOSSIL.—In the June number of the *Geological Magazine* is a description of a very interesting fossil discovered by Mr. Henry Johnson. Professor Woodward, F. G. S. F. Z. S., etc., of the British Museum, has undertaken the duty of figuring, describing and naming this fossil. He has pronounced it a new *genus*, and has given it the name of *eucladia Johnsoni*, a new silurian star fish (from *eu*, beautiful, *klados*, branch). Professor Woodward says:—"The specimen exhibits the ventral surface of the body of the animal, surrounded by five bifurcating arms, each furnished with five pairs of stout pinnæ. The center of the body of the animal is marked by a rosette, composed of five pairs of plates, forming a pentagonal figure, each pair being anchylosed together, and forming at the outer margin a rounded lobe,—like the petal of a flower." He adds, "We have in this fossil presented to us a type of palæozoic star-fishes extending its affinities toward *comatulæ* on the one hand and to *ophiura* and *euryalus* on the other, exemplifying what Professor Owen has termed 'a more generalized type of structure than any at present existing in the class *echinodermata*.'"

SIMULTANEOUS TELEGRAPHING IN OPPOSITE DIRECTIONS.—The London *Telegraphic Journal* describes the method devised by Dr. Gintl whereby messages may be sent in both directions at once on the same wire. Without a diagram it is impossible to explain it with distinctness; but we may say that it is the electro-magnet of the *receiving* station only, that is operated by the current,—that of the *transmitting* station does not work. The writing at either of the respective places is done by its own battery, but depends upon the closing of the key at the other.

COLORATION OF THE ELECTRIC SPARK.—Becquerel has shown that the spark may be beautifully colored by being made to pass through saline solutions. If a spark from an inductive apparatus be made to pass into the extremity of a platinum wire suspended over the surface of the solution of a salt, this spark will acquire special coloration according to the chemical composition of the solution traversed. The saline solutions are best concentrated, and the platinum wire positive. The experiment is performed in a glass tube. Salts of strontia will color the spark red; chloride of sodium yellow; chloride of copper bluish green, etc.

Farming and Gardening.

Insects Injurious to Wheat.

We called attention last week to the appearance of two species of insects, injurious to wheat, which have made their appearance this season in California—one in Santa Cruz county, which had attacked the stalk, and another in Alameda county, which had attacked the roots of the plants. It may not be without profit, at this time, to make a more full notice of what we suppose these insects to be, their habits, and the methods to be employed for their extermination.

Root Worms.

The insect alluded to as infesting the roots of the wheat in Alameda county is probably the *cataphagus lineatus* of the naturalist. There are many species of this troublesome vermin, most of which are known as wire worms, from the cylindrical shape of their bodies and the tough, horny nature of their coverings. When full grown, the one named is about three-quarters of an inch in length, of a yellow color, except about the head, which is brown. The body is divided into twelve segments, and has six feet. The pupa, into which it changes, is white. The perfect insect is a bug, with a horny covering. This insect deposits its eggs near the surface of the ground, where it remains, living upon the roots of whatever plants it may find, until its final change; after which it is usually found creeping among the herbage, seldom venturing upon the wing.

The Wheat-Stem Fly.

There are quite a number of insects which infest the stem of the wheat, and which should always be carefully looked after. One, the *Chlorops pumilionis*, produces a dwarfing effect upon the plant which it attacks. The central shoot being injured, the plant throws out lateral branches below the point of injury. This insect very much resembles the common house fly. Its color is black, with a little pale yellow under the body; the legs ashy gray, but black at the tips. The maggot which it produces, and which does the mischief is white—in its pupa state, yellow, smooth and shining, and about one-twelfth of an inch in length. This is known as the wheat-stem fly. It is, no doubt, either this or one of the two which we shall next mention, that has made its appearance in Santa Cruz county, as noticed in our last issue, from the *Pajaronian*.

Gall Flies—The Joint-Worm.

Gall flies are mostly long, delicate, slender-bodied insects, and covered with long hairs. There are several which attack the stalks of the cereals, in which the female lays her eggs, although they are sometimes deposited on the leaves or buds of various plants. One of the most destructive of this class is the *Isosoma hordei*, or "joint worm." The maggot of this fly is of a pale yellow color, with the exception of the jaws, which are dark brown. The egg from which it comes is deposited just above a joint, near the ground,—hence the name. A number of eggs are usually deposited near the same joint, and little elongated blister swellings soon make their appearance, beneath which, in little cells, the maggots are hatched, and feed upon the juices of the plant. In addition to what is needed for food, a large extra amount is also stopped in its progress to form the abnormal woody enlargement or swelling. When five or six eggs are thus deposited about a joint, a large portion of the sap of the plant is there absorbed, and the grain, thus robbed of its nourishment, suffers as a matter of course, both in bulk and numbers. This fly, in depositing its eggs, places the top of its ovipositor upon the stalk or stem, and gradually works it down into the same, so that the deposit is made *under* the skin—one egg in each place.

The first brood of the joint-worm fly, for the season, usually makes its appearance, in the Eastern States, about the middle of June. After coupling, the female lays her eggs, and a small percentage pass, by some inexplicable law of nature, rapidly through the pupa to the insect form; but the great bulk of the larvæ remain in the cells until the succeeding spring. *This* is an important matter for consideration, as will be hereinafter shown.

The Hessian Fly.

The wheat midge, or Hessian fly, although belonging to the family of gall-flies, does not produce the enlargement above spoken of where the egg is deposited. If the farmers of Santa Cruz who are troubled with the "fly" spoken of by our Watsonville cotemporary, will carefully examine their wheat stalks, they will be able to determine whether or not they have the Hessian fly there, without examining the insect itself. This fly, the *Cecidomyia destructor* of the books, has two broods each year—in the spring and autumn. The female lays twenty or thirty eggs, not in the *stalk*, but in a crease or other convenient place *on the surface of a leaf*. They hatch out in three or four days, and the pale red larvæ crawls down inside the leaf, as close as possible to the joint. Here, head downwards, the insect imbibes the sap of the plant, by sucking it through the outer skin, until, by pressure between the leaf and stem, it gradually becomes imbedded in the latter.

The first appearance of the fly is soon after the wheat comes up, and from the pupæ of the previous year. These lay their eggs and disappear. The maggots from these eggs are mostly hatched, in New England, from June to July, and take the perfect form just before the grain is ripened; but a portion remain on the stubble till after harvest, and some retain the pupa state until the next spring, and then come forth as the spring brood. The fall brood is the most numerous.

When two or three of these maggots become firmly imbedded in the stalk, as above, they take up much of the nourishment of the plant, thereby greatly weakening it, and sometimes causing it to utterly wither and die.

Fig. 1.

Fig. 2.

We have endeavored to show, in the accompanying Figure 1, the appearance of the stalk of wheat after it has been attacked by the *Isosoma hordei*, which produces the joint-worm. The leaf has been stripped from the stem, so as to show the little elongated, blister-like swellings, produced by growth of the maggot from the egg which has been deposited beneath the skin of the plant. The little hole shown is the orifice through which a fly has escaped. From three to ten of these cells will usually be found close together, and generally just above the second or third joint from the ground.

Fig. 2 represents the appearance of the stalk from which the Hessian fly has escaped. As the maggot from which this insect comes does not live within, but upon the stem, the place from which it escapes is a mere indention, within the woody fiber of the stalk. Thus, by a careful examination, the observer may be able to tell whether he has been troubled with the one or the other of these insect pests. The mode of getting rid of them is alike in both cases; but the Hessian fly is the most troublesome and irrepressible of the two.

How to Get Rid of these Pests.

There is only one available mode of destroying them—by FIRE. By a careful perusal of what we have already written, it will be understood that when the harvest is over all the seed, so to speak, of the next year's product is snugly stowed away near the lower joints of the stubble, and comfortably housed for the winter between the leaf and the stem. Californians have a rare opportunity to get revenge for the past and take security for the future. In our dry climate, a fire may readily be made to pass slowly and without danger over a stubble field. If you burn every stalk, you will be sure to kill the pupæ of every one of these Hessian invaders. But you must induce your neigbbor to do likewise, or his spring crop of flies will invade your field also, and you will derive very little benefit from your labor. With the stubble you must also be careful to collect and burn all the chaff and straw.

But, says one, who has been examining his straw, I find the little cell-like protuberances mentioned, in my stubble, instead of the smooth straw, with only a slight depression where the pupæ of the Hessian fly may be supposed to have been resting; what am I to do to get rid of *my* enemy, the joint-worm. Do the same thing, my friend; it is the best thing you can do. Your enemy will either be found creeping about on the surface of the ground, for he can't fly half as well as Marriott's Avitor, or you may find him snugly stowed away for the winter, just below the surface. If he is on the ground, you will be sure to burn him up with the stubble; and if he is in his nest, you will most likely smother him or scorch him so that he will never trouble you again. It is the best you can do at all events. Soaking seed and such things may all be very well to aid in germination, but it won't do the first thing toward preventing the appearance of the fly, the worm or the rust. It will act merely as an aid to good cultivation.

Importance of Good Cultivation.

It is well known that both insects and fungi are more inclined to attack weak and sickly grain or other plants than that which is vigorous and healthy. Especially is this the case with fungi, such as rust, etc.; the reason for which we have already given in previous articles. There are many insects of the class under consideration which *never* attack a living plant. Hence the necessity of special efforts to secure good cultivation and vigorous growth, as one means of avoiding such annoyances. The reason why cereals upon new lands are more exempt from insects and rust than upon old, does not arise so much from the fact that the germs are wanting in the former case, as from the lack of the proper conditions for their production or growth. When the lands become "worn out," as we call it—when, from a neglect of proper care in dressing, the soil has become measurably exhausted of the peculiar chemical combinations which are most essential to vigorous plant growth, and the annual growth of grain has thereby become stunted, thin, and lacking in vigor—then, and not till then, is it that these pests make their appearance.

It is so wisely ordered by nature, that if her laws of proper conditions are kept up—that if we return to the soil in some other form that which we take away from it in the way of its natural productions—we need entertain no fear that nature will fail us in her annual yield. Her laws are immutable and just. The Hessian fly has doubtless its office in the wise orderings of Providence; but the destruction of the cereals, the natural food of man, is not one of its offices—it is simply one of the penalties attached to man's neglect. If all the wheat raised in a given region was allowed to decay on the spot where grown, and return its elements to fructify the succeeding year's crop, and so on perpetually, there would never be an increase of the Hessian fly beyond the number needed for the support of its numerous parasites, some of which live upon its egg—others relying for support upon its destruction in its semi-pupa state. So well known is this fact that some naturalists have suggested the encouragement of these parasites as exterminators of the fly. A better way, however, and one more nearly in accordance with the natural order of things, is to pursue the course above pointed out—destroy by fire the great bulk of the fly-producing larvæ, which your neglect has introduced, and trust to after good cultivation and the friendly aid of such number of parasites as nature may provide, to keep them down in the future. Intelligence, care and united effort is all that is needed to rid any country of all such vermin.

Sheep in the Tule Lands.

The tule lands of the State are coming more and more into notice and value. They will soon be looked upon, as they ever should have been, as the most productive of any which we possess. A correspondent of the *Times*, of this city, has shown that they may be, even in their unreclaimed and unimproved state, advantageously employed for sheep culture. All that is needed is, that there should be some small portion within or contiguous to every ranch, which shall be above the highest water, so as to be used as a place of refuge when the necessity exists. Where no such place is found naturally, cheap Chinese labor may soon prepare a spot, where animals may be herded during the short period of overflow and fed with hay or roots. Such is the common method of preparing sites for dwellings and villages in the valley of the Nile, where the overflows are quite as deep as on the tule banks of the Sacramento and San Joaquin. The correspondent above alluded to says:

Every one knows of the immense tule lands in the vicinity of Suisun, but very few know of their being used as pasturage for sheep; nor was it until about a year ago that the experiment was tried. At that time D. R. Pringle bethought himself of experimenting on sheep raising in the tule, and on making his ideas known to a few of his neighbors he was laughed at and told he "must be crazy." Nothing daunted, he procured about four hundred sheep and turned them into the tule. They throve much better than he expected, and in less than a year he had the pleasure of being the possessor of about six hundred sheep, being an increase of two hundred while in the tules.

HORSES FEET REQUIRE MOISTURE.—Nine-tenths of the diseases, says the Ohio *Farmer*, which happen to the hoofs and ankles of horses, are occasioned by standing on the dry plank floors of the stable. Many persons seem to think, from the way they keep their horses, that the foot of the horse was never made for moisture, and that, if possible, it would be beneficial if they had cowhide boots to put on every time they went out. Nature designed the foot for moist ground—the earth of the woods and valleys—at the same time that a covering was given to protect it from stones and stumps.

AGRICULTURAL MACHINERY.—The best evidence of the agricultural progress of the Pacific Coast is the increasing demand witnessed here for agricultural machinery. California will soon, if she does not already, go beyond any other State in the Union, in proportion to her agricultural products, in the employment of machinery for cultivating and harvesting her crops.

A HIGH-PRICED COW.—Mr. Geo. Frost, of West Newton, Mass., recently sold a Jersey cow to a Pennsylvania farmer for six hundred and fifty dollars.

PROLIFIC WHEAT.—A single grain of wheat in Boise Valley has produced one hundred and twenty stalks, bearing heads averaging thirty grains each.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, July 31, 1869.

City Stocks.

The market for miscellaneous securities has not acquired any activity since our last similar reference, and the transactions in local stocks have been upon a limited scale. Private sales to some extent have been effected, but the public offerings were small. We notice sales of Spring Valley Water stock at $63 62 and $63 25 per share. California Steam Navigation stock realized 56 per cent. Ninety shares of S. F. Gas stock were sold at $85 per share.

Mining Share Market.

We remark rather a quiet market during the early part of the present week, but at the close a much livelier feeling sprang up, producing increased sales at a generally improved price. As to the present condition of the Comstock Lode, it may be stated that many mines seem to have a more hopeful look, and that more satisfactory results are looked for in the future. White Pine stocks command the usual attention, and if anything offerings have increased at somewhat lessened prices.

HALE & NORCROSS—exhibits considerable improvement. During the week ending July 24th the ore product amounted to 781¾ tons, from the following localities: 175-level, 113¾ tons; 300-level, 58½; third station level, 25½; and fourth station level, 584¼ tons. During the same time 1,071½ tons were delivered to certain mills, leaving 1,635 tons on hand at the dumps. We learn nothing further with regard to the developments in this mine.

CHOLLAR-POTOSI—was in increased demand near the close of the week. For the week closing July 23d, 1,349 tons of ore were mined, and 1,430 forwarded to reduction mills. This yield came from the following localities: Blue Wing, 721 tons; New Tunnel, 444½; Grass Valley station and croppings, 183½ tons. The Blue Wing stope is reported as looking well and producing largely. The quantity of ore in sight is greater than at any period during the past two months. In the New Tunnel the quality continues good, but the supply is not so large as for some days past. On the 23d inst. $19,892 in bullion was shipped to the office in this city. The ore slip of the 26th states that seven mills were supplied with 196 tons of ore, in the aggregate, on that day.

CROWN POINT—is in better favor. The *Daily Herald* has a telegram, stating that "a strike in the Crown Point 1,000-foot level, east drift, is reported."——BELCHER was in moderate request. It is reported that several raises have been made east of the 337-level, and that some good ore has been found.——The OPHIR, on the 27th inst., had extended its drift a distance of 473 feet. On the 22d inst. an assessment of $3 per share was levied.——OVERMAN sold at an advance. On the 24th of the current month $7,580 in bullion was sent forward to this city.——IMPERIAL is not active. A telegram of the 28th states "that one of the reefs at the new shaft broke, and work is stopped until a new one can be put in its place." Nothing new otherwise.

SIERRA NEVADA—is not in large demand. From letters to the 24th inst. we learn that this mine does not look quite as well as previously reported, except the south breast, which is said to look better than ever. The large body of ore on the south side of the shaft has not equaled expectations, and is now quite poor; the works have, however, developed the bonndaries of the deposit, and proved the existence of a large body of ore.——JUSTICE AND INDEPENDENT levied an assessment of $5 per share.

From the *News* we cull the following in reference to some of the White Pine claims:

ORIGINAL HIDDEN TREASURE—Ten tons of good ore are taken out daily and sent to mill. A larger body of fine ore is in sight in the north breast than ever before, and a broad body of the same quality is being opened in the south breast.——INDUSTRY is yielding and sending to mill about nine tons of ore daily. The original shaf was sunk to a depth of 33 feet, finding five feet of ore at the bottom. This was breasted north 30 feet, and a winze commenced. After sinking 20 feet on this, the foreman caused a shot to be put in the roof immediately nbove it. This threw out a quantity of very rieb ore, when the winze was covered over and stoping commenced. The stopehas been carried np 16 feet and sonth to within 15 feet of the shaft, where the ore was hut five feet thick, and has revealed an immense body of high grade ore, through which masses of horn silver are freely distrihuted. A dividend of $4 per foot has been announced.——MAMMOTH quoted at $1 75. The Shehoygan shaft or incline is down 25 feet, in a very large body of fair ore. The shaft in the east surface cut is 20 feet down, toncling on the foot wall, showing a hody of ore 14 feet thick, average assays of which go $260 the ton.——CONSOLIDATEN CHLORIDE FLAT has been raising and shipping ahout the same amount of ore this week as last—37 tons per day.——VIRGINIA shows a large body of rich ore in the north drift, 30-level, 20 feet from the shaft. The hody of ore heretofore mentioned as extending from the surface down the 20-feet sonth breast still holds its size, and is much improved in quality. Ten tons of ore per day will be the regular shipment nfter this week.——In POGONIP AND OTHELLO, work is progressing in the north and Othello shafts, and the ore piles ahont the mine begin to assume mammoth proportions.

California Savings Institutions.

The following table is very instructive. The first thing that nttracts attention is the rapid increase in number of depositors, and the yet greater increased volume of their deposits, within the past six months. This is the more remarkahle, in view of the depressed and stringent coudition of the money market during April, May, and June. From January 1st, 1869, to July 1st, the deposits augmented $2,400,569, and the depositors 2,081, which gives an average of $1,153 to each of the new depositors. Bnt dividing the total of deposits amoug the total number of depositors will give to each ahout $775, which is an increase of $26 to each person since Jannary 1st, 1869. In the course of a single year, the number of depositors in the various Savings and Loan Societies of San Francisco augmented 5,909, and the volume of their deposits was increased $5,004,713—equal to $850 for each person. Let us contrast these figures with those of the more flourishing Eastern States. The average annual increase in the Massachusetts savings banks from 1850 to 1860 was 12⅔ per cent., gold; while, from 1861 to 1867, it has only been 8⅝ per cent., currency, or 4⅓ per cent. gold. In 1861, the average to each depositor in the New York savings banks was $224, gold, and in 1868 it was $281, currency, which is equal to $208 gold, showing a decrease of $16, gold, to each depositor. In Philadelphia, a like decline is noticed. The average per depositor in 1861 was $192, gold, and in 1868 it was $209, currency, equal to $155 gold, showing a decrease of $54 to each depositor.

The Sacramento Savings Bank dishnrsed a dividend of 1 per cent. per month for the period embraced in tbe above report Oakland Bank of Savings, 1 per cent. per month on first-class, and 10 per cent. per annum on second-class deposits; and the Stockton Savings and Loan Society, 1 per cent. per month to shareholders; 10 per cent. per annum to first-class depositors—6 months; 8 per cent. to second-class—3 months; and 4 per cent. to transient depositors. In the reserve funds of the Stockton and Oakland institutions are included the sums of tbeir partly paid up capital stock.

Our interior savings hanks have not heen idle, but have kept pace with the general prosperity exhibited by metropolitan establishments. From July 1st, 1868, to the same dato in 1869, the nnmher of depositors has increased 1,888, and the deposits, $720,050, being $381 for each depositor. Several other savings hanks have been recently organized in the interior; hnt sufficient time has not yet elapsed to embrace them in our report.

The dividends for the term of six months under review are as follows: Hibernia, 10 per cent. per annum; Savings and Loan, 12 per cent.; French, 11 per cent.; Savings Union, 11 2-5 per cent. on term, and 9⅗ per cent. on ordinary; California Building, 10 per cent. on ordinary, and 12 per cent. on term; Odd Fellows', 13 per cent.; Farmers' and Mechanics', 10 per cent. on term; German, 9⅕ per cent. on ordinary, and 11 2-5 per cent. on term deposits. The Odd Fellows' Savings Bank, the Savings and Loan Society, the French Savings Bank, and several others, pay proportionately higher dividends than the other institutions, for the reason that they disburse to depositors alone their dividends ont of the net earnings, while those managed by stockholders allow additional dividends, which we have reason to helieve are quite large, though not made public.

COSTA RICA MAHOGANY can be had on very reasonablo terms of Hobbs & Gilmore, Market street, near Beale. ***

IT may be singular, perhaps not, that no one purchasing spectacles from C. Muller, 205 Montgomery street, is ever dissatisfied with his bargain.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine. *

CHICAGO TRIBUNE.—This journal announces itself "at home" to all its friends and patrons in its new and splendid building, and sends us an engraving of the same, with a descriptive pamphlet.

SHIPPING ORE BY RAIL.—A correspondent says there are large quantities of ore at Gold Run which averages from $40 to $100 to the ton, which should be worked by smelting, and thinks that such ore might be sent to this city at a profit. The railroad charges $10 per ton for shipping ore from Golconda Station to Sacramento.

THE PACIFIC WOOD PRESERVING CO. have commenced the reconstruction of their works, which were recently destroyed by fire, on King street. They will be in operation in a few days, and the new works will be better guarded against accident by fire than the old ones were.

Get Your Engravings

Made at the office of the MINING AND SCIENTIFIC PRESS in season for printing your circulars for the Mechanics' Institute Fair. Remember, a good engraving cannot usually be made in a day.

Parties who wish first-class wood cuts and electrotypes for illustration in newspapers, pamphlets and trade circulars, should call at once and examine specimens.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Mountain.—*Miner*, July 17th: We visited this tunnel yesterday. We find that they have struck a ledge of ore and are in about four feet. The quartz resembles that fouud in the Florence several years ago.

Morning Star.—Over 100 tons of fine ore has been taken out within a few days, and large bodies in sight. It is intimated that the company will ship this ore to San Francisco for a market. An increase of force is to be put ou.

Boulder Hill is again attracting attention. The near completion of the mill of the M. Co., and the probability that it will bo able successfully to work these ores, encourages parties to hope.

Items.—*Chronicle*, 17th: The Imperial Tunnel is in over 1,000 feet.....The Bullion do. abont 950 ft.....Mountain Co. has levied au assessment of two dollars per share; the stock will be delinquent August 30th.....Work has again been commenced nn the Leviatban, and this week a quantity of excellent ore, mostly copper, has been taken out. It is thought that it will pay to ship it to Swansea.

AMADOR COUNTY.

Anaconda Mine.—*Ledger*, July 24th: Mr. Palmer, the Supt. informs us that it increases in richness every foot they go down, and the last week they took out some rock tbat was literally studded with free gold.

CALAVERAS COUNTY.

Palomo.—*Chronicle*, 24th: The Palnmo is yielding large returns. At the depth of 200 ft. the lead is wide, well defined and tbe rock of a superior quality.

Harkins' Claim—Enormous Yield.—At the washing on Saturday, 440 ounces of gold was taken out—the result of eight men's labor for five weeks—an average of $34 per day to the haud. Those croakers, who sit around bar-rooms with chairs tipped back, bewailing the "played out" condition of the mines, will now bave another chance to grnmble at "their luck."

Rich Rock.—Twenty-four tons of rock from the Eherbardt mine at Independeuce, in this county, crushed at Harris' mill, yielded 89 onnces of gold—an average of $63 per tou.

Copperopolis.—Stockton *Independent* of July 26th: From a letter we have received from Copperopolis, we learn that there is great excitement in that town over some new discoveries of gold-hearing quartz and ledges of slate. Many parties are locating claims. Mr. Tulloch, of Knights Ferry, has discovered a quartz lead that yields $20 per ton. One of the slate claims is working about 30 men, getting out slate for shipment, and bas a fine prospect for a permanent and profitable business. The Union Copper Company are workiug 20 Chinamen sorting ore, and are about to again start the smelting works. The future prospects of Copperopolis are promising

MARIPOSA COUNTY.

Merced River.—Correspondeuce of *Mail*, July 23d: Every tou of rock takeu from the Hite mine has been run through the mill; not a single ton has been thrown aside, and we are reliably informed that the mill has never been cleaned up without a profit. The Fergusou Co., five miles from the Hite, couveys its rock from the miue to the mill iu a low grade tunuel 1,100 ft. long. The mill runs 8 stamps with an overshot wheel, and grinds six tons of ore every 24 hours.

NEVADA COUNTY.

West Eureka Mine.—Grass Valley *Union*, July 23d: The company have commeuced work in earnest. Au incline six by eight is being suuk ou the foot-wall of the ledge, and fine looking rock taken out.

The Situation.—Matters are quiet. Prospecting has revived somewhat, and the custom mills will be overrun with ore during the coming month.

North Star.—*Bulletin*, 24th: At the special meeting of tho North Star, held yesterday, 2,300 of the 3,000 shares were represented. F. A. Hassey made a proposition to purchase the mine at $300,000, payable in one year, the product of the mine in the meautime to be placed in charge of a enstodian mutually agreeable to purchaser and stockholders. The propositiou was rejected. At the conclusion of the meeting it was understood that work would bo again commenced at the mine.

Pittsburg.—*Transcript*, 21st: It is quite lively at the Pittsburg mine, there being about forty men at work, and in a short time many more will be employed.

Town Talk.—This gravel claim on Howard Hill, is heiug worked with considerable energy. An 8-stamp mill is used in crushing the ground, which pays an average of $5 per day to the hand.

Spring Slide.—Same of 22d: The owners have prospected this claim by a shaft, aud are now running a bedrock tunnel to open it. They have struck a channel of gravel eight feet in depth, every foot of which prospects well. A gentleman informed us that he obtained as many as 30 or 40 colors from a pan of dirt.

A Great Enterprise. — The North Bloomfield Gravel Mining Co. are making rapid progress on their line of ditch from Little to Big Cañon Creek. They have had about 150 men employed, and 150 more will be put on.

Struck it Rich.—Same of 24th: The Eagle Co., at Grizzly Hill, struck very rich quartz ou Wednesday. The owners reside in Hartford, Conn., and aftor spending an immense amount of money upon their claim, had nearly concluded it would not pay to continne the work much longer, when to the delight of the superintendent, a piece of rock weighing five pouuds was thrown out, which was broken up and yielded a little over $200. This was in the forenoon, and iu the afternoon a ledge was struck, measuring six feet in width, and in the center two feet of the richest quartz ever seeu in that section of tbe couuty.

The Empire.—*Gazette*, 28th: We learn that Capt. Leo has now a full force of workingmen. A number applied on Monday, for whom there was no room. Among those employed, are a few of the old hands, who have abandoned their opposition to giant powder, or were perhaps dragged into tho late League in opposition to their better judgment.

PLUMAS COUNTY.

Port Wine.—La Porte *Union*, 17th: A cave occurred in the Union Co's tuunel last Thursday. A contractor was rnnning an air shaft upward from a point 2,800 feet from the mouth of the tunnel, when the quicksand began to pour down in a small stream. The miner saw the approaching danger, ran down the ladder and called all hands to leave the tnnnel. In less than an hour over 400 tons of tho sand had fallen into the tnnuel, completely blocking it up and paralyzing operations for the prosent.

The Michigan claims, adjoining the Nip and Tuck, above Gibsonville, were sold to the Nip and Tuck Co. a few days since for $12,000. The claims have a frontage of 700 feet, and the ground is supposed to contain good pay. There were seven interests in the Michigan Co.

SHASTA COUNTY.

Specimen.—*Courier*, 24th: This week Mr. Hathway showed us a gold specimeu which weighed uine onnces. It coutaiued a little quartz, but was mostly gold. Found on Rock Creek.

SIERRA COUNTY.

Gibsonville.—Correspondence of the *Messenger*, 24th: Our water season is over. Considerable work has been done in the hydraulic liue, pipiug off banks that have been mostly drifted out. But this has not beeu profitable.

The Chalcedony and Bootjack claims, which have been working for some time below drainage, have struck au increase of water that has driven them from their lower works, aud which will necessitate another tunuel or steam machinery before their ground can be successfully worked. H. Taber is pushing his tunuel ahead as fast as muscle and powder will do it. Very good progress is being made, and hopes are entertained of tapping the gravel before the summer is out.....Messrs. Keefer & Emerton are doing well.....The Union claims, as usual, are payiug handsome dividends. They have water most of the year. ....The Nip aud Tuck, Schofield & Co., havo their claims in fiue working order. They have cleaned up over $30,000 this water season, and being now thoroughly opeued and prepared, they expect to do much better the coming year.....The Nevada claims, next above, are still yieldiug well. Antroo Cook is in with his bedrock tunnel 600 feet.....The Redding, Phœnix, and North Americau, at Hepsidam, are doing well. The latter company aro having to run a new tunnel. Their bedrock is on the raise, necessitating a chute and too heavy grade. The tnnnel will be about 1,000 feet loug, through gravel and pipe clay, aud the work will be comparatively light.

TRINITY COUNTY.

Trinity Center.—*Journal*, 24th:—H. Y. Fitch has found very rich diggings in the hill, opposite his residence on Hatchet creek. Three men with a small head of water tnok nut seven hnndred dollars in twenty-seven days. Smith & Carter have obtained gond prospects in the mouth of the east fork of Coffee creek, about nine miles up. The gold is coarse, and this discovery is attracting the attention of miuers in the vicinity. It is expected that the Chinaman who bought James Murray's claim, will take out three thousand dollars this season.

Stewart's Fork Ditch.—The Trinity Water, Lumber and Mining Co. filed its certificate of incorporation at Weaverville, on the 17th. This company intend to convey the waters of Stewart's fork upon the extensive mining section ranging from Weaver basin to San Matre's. It is of the higbest importanco to the county that this be done.

TUOLUMNE COUNTY.

Quartz Mill Burned Down.—Sonora *Democrat*, 28th:—The Valparaiso Mill, on Jackson Flat, near Tuttletown, was entirely destroyed by fire on Monday.

Lower California.

San Borja.—Mazatlan correspondence of S. F. *Bulletin:* The new law, making tbe exportation of ores free, has benefited cousiderably the miuing interests of this part of the country. Numerous mines have been taken up again after having stopped for many years on account of the rebellious character of the ores, and prospecting has become a new trade. This led to the discovery of the rich mine of Biriuroa, near Tapia, which promises a fabulous wealth, the vein being very wido and the assays showing enormous richness. At Cosala, the Cosala Miuing Company and Nuestra Señora are taking out rich ores, the latter furuishing 100 marks of silver weekly. At Copala, the Sombrero mine is in *bonanza*, and the Tajo miue will finally be enabled to work up its large stock of ores, haviug received new machinery by the brig *Schelekoff*.

Arizona.

Items.—Prescott *Miner*, July 10: H. A. Bigelow, of the Bashford Lyux Creek, informs us that the ditch is nearly completed.....Taylor & Davis, of Upper Hassayampa, are at work on their water wheel. Their arastras are completed.....Frank Alters informed us that several men, at work near the Chase mine, with rockers, were making from three dollars to an ounce a day.....C. T. Rogers has purchased for $500 sixty-six and two-thirds feet in the Independence mine, Goodwiu District. Work is heing prosecuted at this mine with promise of success. The owners of the Sterling bave their deeds ready to pass over to the Sterling Mining Company, as soon as the purchase money is paid them, which will be on the 12th. The sum is $30,000 in gold. The shaft is being sunk deeper; work in the sonth tunnel was progressing, and the mechauics were hammering away at the mill.....Tho news from Waluut Grove continues good. Miners are doing well.

Colorado.

Items.—*Register*, 15th: The Black Hawk mine on the Gregory is producing finely, both in quantity and quality of ore. Both of the mills are running up to their full capacity.....We were shown yesterday a specimen of silver ore from the Coaley. A seam of nearly pure silver, au inch thick, runs through it. Better ore was uever produced on the continent.....Charles Mather has got his six-stamp mill in operatiou, runuing ou waste rock from the Bobtail, and obtaiuing fair results.....Hoosier No. 5 north is producing more aud better ore than at the discovery.

Quartz Hill.—A number of meu are doing well at sluicing, on the old Patch diggiugs. A. C. Johnson is putting up a 16-stamp mill on the ditch, aud will start it up in a few days. Smith & Co. are refitting the old 15-stamp mill near the North Star mine, to run on custom ore. Geo. Mitchell has got the North Star 20-stamper running ou Illinois ore. It has been thoroughly repaired. The mine is yieldiug largely, but the ore is of lower grade than usual. Wheeler & Entwistle are at work on the old Chunk lode at Bortonsburg—have opened it in two places, aud in one shaft havo a veiu of fine-lookiug quartz three feet in width.

Ward District.—The Ni-Wot lessees are practical men. They keep 30 stamps in motion, aud have a large lot of smelting ore saved that will assay $90 per ton. On the Stoughton, Thompsou & Hartwell are raisiug a ton per day of smeltiug ore that will assay eight ozs. in gold.

Leavenworth Gulch.—Mining is more active thau at any time for four years. Parties have been working on No. 7—Dr. Harsh's claim—for several weeks, taking out rock that runs $235 per cord. Messrs. Dunn & Co. are working tbe Rockdale Co's claims on the Calhoun, under lease. Their ore yields seven to eight ounces per cord. One claim on the Idaho is being worked, producing ore that yields ten to fifteen ounces per cord. Their pay vein is from 12 to 20 inches wide.

Georgetown.—*Miner*, July 15th: The Washingtou Mining Association of New York, Geo. Stille, Superintendent here, are now putting in their mill three of the "Krom Dry Ore Concentrators," for custom work. H. S. Jacobs, Esq., of New York, one nf the Directors, arrived here, and is superintending the re-arranging of the mill. The first test was from a small lot of second class Terrible ore, that gave an average assay before concentrating, of $110.55 coin value. The concentrated ore gave a resnlt of $296.74 coin, aud the tailings $17.12. The loss is about tbree per cent. The second test was from sulpbnret and ruby ore, from Dailey district; average assay, before concentrating, $82 coin. The concentrated ore assays $800.40 coin, and the tailings $21.30. This test we do not cousider a fair one, for two reasons. First, there was not enough of the ore to work the machine properly; and second, the ore was not graded as it should have been.

Baltimore and Colorado Tunnel.—The advance made is 125 feet, the depth from the surface being 76 feet. The next teu feet of advance will increase the depth 40 feet. Oue vein bas been crossed, of which we bave previonsly made note, which is full 17 feet in width. Assays from this vein range from five to fifty-two ounces of silver to the ton of ore. A contract has been let to run a drift 50 feet east on this vein.

Empire.—We learn that the pnmp on the Conqueror mine is not working as it should. The Tindall process, in the Peck mill, is being run with poor results.

Idaho.

New Placers.—Silver City *Wave*, July 20th: Placers have recently beeu struck along the east side of Florida Mountain, commencing at Joe Brown's Gulch, below Ruby, and running along the rimrock this way, some 3,000 feet in all. Messrs. Walbridge, Blake, Jordau, Amon and others have the north end, and Joe Brown, J. B. Bailey, Heury Martin aud H. J. Bixbey have located 600 feet on the south. Au effort will be made to convey water to tbese rich deposits. The surface is said to prospect one cent, and Mr. Bixbey informs us that at the depth of a few feet as high as eight cents can be procured. An old shaft, snnk by Bixbey and others a year ago, 80 feet deep, on the same ground, has yielded as high as $5 to the pan in the bottom.

New Ledge.—The Home Resort, or "Brazen Elephant," as McConathay's extension is called, is a ledge of very fine quartz, showing gold and native silver, discovered last Wednesday by J. Chauncey above the Whisky Gulch shaft house. We visited it on Saturday, and found what appears to he a very well defined ledge. Tho rock, at a depth of four feet, is solid, and the vein two feet wide.

Potosi.—Same of 23d: This mine is now being worked by C. S. Peck. The shaft is dowu 63 feet below the second level, or 110 feet from the surface. A good face of fiue looking ore is in sight.

Silver Cord.—The Cosmos mill is puffing away on Silver Cord ore. Ten stamps, six pans and three settlers are iu lively exercise, with plenty of food ou the dump and in front of the batteries to keep them moving for many a day. The machinery works to a charm, and the rock looks well.

Ida Elmore.—*Avalanche*, 24th: This mill has rosumed wnrk. The new hoisting works will be ready for operations uext week.

Dexter.—Owen McMahon & Co. aro sinking a shaft, and the prospect is favorable. Every particle of ore extracted from it as yet contains more or less gold. Tho shaft has been sunk 15 feet.

Red Jacket.—Several hands are at work, and indications continue favorable.

Allison.—The uew hoisting works are in operation.

The New York mill is pounding away night and day on Golden Chariot rock. The ledge is as large as ever, and the ore has not lessened in valne.

Water Ditch.—Capt. Tedford and others contemplate cutting a ditch for the purpose of conveying tho water of Jordan creek from near the old sawmill site, two miles above town, along the south side of the creek to Wagontown, for miniug purposes. This is an important enterprise, for it will supply with water many rich placers which are known to exist in that region.

South Mountain.—"Howard" writes the *Avalanche* that there has been discovered in the mountains 24 miles sonth of

Silver City an immease lead lodo in lime, like the deposits of White Pine. It is 44 feet wide, aad assays in silver $137 to $266 per ton.

FLINT DISTRICT.—Two capitalists from Chicago worked two tons of Sherman rock a few days since; result, $538 silver. Six tons Jacoh Astor was lately worked; $210 per ton.

Nevada.

COPE DISTRICT.

The Elko *Independent* of July 21st says: Mr. Cutter, who returned from Cope on Saturday, says everything looks promisiag. The Argenta appears to hava tho largest masses of rich ore. Tho owners believe that they can take out a ton from the hottom of their shaft that will equal any ton that ever came out of the Eberhardt. We have a specimen that is covered with horn silver. Numerous other lodes are being prospected, and all are showing good ore.

RICH ORE.—Three tons of ore from tho Argenta, taken to Doll's mill, Washoe Couaty, by Col. Fraak Denver, worked hy dry process $620 per ton, and hy the wet process, $439 per ton.

LITTLE GIANT LEDGE.—We were shown some very fine samples of ore yesterday from the above named ledge, which assayed at the rate of $640 in silver and some gold. This ledge is one of the latest discoveries.

MORE GOOD NEWS.—Same of 24th: Mr. L. Summers arrived in town Wednesday, with soma ore from the Little Giant. A piece that had been huraed in a blacksmith's fire was completely spotted with silver drops. He also showed a sample of ora that was all metal, from the Black Warrior. This assays hut $5 per ton in silver, but we think coatains a large per cent. of copper, with some lead aud antimony. This lode is hut 25 miles from Elko, and is 12 feet wide.

COPE.—Three assays made yesterday, from what has herctofore hcen supposed to be the cap rock of the Argenta ledge, went as follows: $12,064; $6,325; $6,254. Aa assay made on ore from the Sunay Hill ledge yielded $852.22 to the ton iu silver.

BULL RUN DISTRICT.—We were shown some rich and heautifnl specimeas of ore yesterday, hy G. L. Tucker, who has just returaed from Bull Run. The ore was from the Porter ledge. The ledge crops above the ground a distance of 650 feet, is from two to four feet ia thickness, and shows rich ore the entire distance. Mr. Tucker had two assays made of the ore siace his return, one of which went $1,417, and the other $1,100.84.

REESE RIVER.

BUEL NORTH STAR.—*Reveille*, July 17th: About aight moaths ago, C. C. Laae was appointed snperiutendent of this mine. The vein had been lost for some time, and several unsuccessful sttempts made to find it. Mr. Lauo started a drift iato the hill, from the hottom of the iacline,—4,000 feet down. The vein was found after ruuning 200 feet. The incline was abaadoned, a consolidatioa effected with the Lane and Fuller companies, and the working of the mine was trausferred to the perpeudicular shaft of the latter, some distance higher up tho hill; a drift having heeu run from the bottom of the shaft, connecting it with the works of the Buel North Star. All this drifting and moving of machinery uecessarily entailed expense; but as ore was being extracted the company (a Boston compaay) has never heen called upon for one dollar since the vein was struck, hut on the contrary, have had $52,000 (currency) sent them as dividends, whereas the total amount furnished hy them up to the time of the striking of the vein was only $17,797.60 (coin). At present the mine is in a fix which it does one good to look at. We think that 3,000 tons may he said to he in sight, and that their yield will not he far from $600,000.

The article proceeds: "Though not a bettiag man, we will go any of our White Pino cotemporaries, say $100, to he appropriated towards a suit of clothes, that the Buel North Star miue, of the Lane & Fuller Co. will yield more hullion in the next twelve months than any oue mine in the White Piue district, not exceptiug Aladdin's cave, the great Eberhardt."

BULLION.—Amount of bullion produced for the past week: Manhattan mill—19,800 ounces. Mettacom mill—12,201 ounces.

MINERAL HILL.—Another exodus of our citizens has taken place to this new district. Our mill superintendonts are looking for hands in vain. We shall soon hear something definite from the new mines.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

YELLOW JACKET.—Gold Hill *News*., July 24th.—An iacreased number of men have heen employed dnring the past week, and an average of two hundred tons of ore per day extracted. The air in the snnth mine is improving. It will he some weeks yet beforo tho water is out. Some forty feet of the shaft has also to he retimhered. The old building over the hoisting works is mostly taken down, and will he rehuilt in differeut shape. The hoard of trustees voted to donate $2,500 for the relief of tho sufferers hy the late accident. They also voted to levy an assessment of ten dollars per share an the capital stock.

CHOLLAR POTOSI.—The loss of the fine new hoistiag works and extonsive buildings coanected therewith, destroyed by fire last Wedaesday, did not interfere materially with the workiag or ore productiou of tho mine, as the new shaft developed nothiug at the lower levels, and the prospecting through this shaft, as well as the ruaniag of the works, was only a bill of expense to the company. The entire loss of company property hy this fire is estimated at $80,000. The shaft was too far west, aad for deep prospecting it would pay the company well to abaadon it and sink coasiderably further east. The yield is 250 tons per day, assaying ahout $50 ou the average. Excellent hodios of ore have heen developed within the last few days.

SIERRA NEVADA.—The mill still pounding away, reducing over forty tons of ore per day, on the average. The ore beiag worked at present is thought to he of extra quality, although less free gold is perceivahle; this poiat, however, will be satisfactorily demonstrated at the next clean-up, which takes place on the 31st.

VIRGINIA CONSOLIDATED.—New shaft will be dowa to the level of the Latrohe tuuuel to-morrow, 184 feet from the surface. All the waste rock and earth is sent out through the tunnel, and hy means of a windlass the siuking cau he continued for fifty or sixty feet deeper, by whioh time the proposed steam hoistiag works at the surface will be ia positiou.

KENTUCK.—The opening made beneath the firo, through the 900-foot, or lowest level of the Yellow Jacket, will develop a fine body of pay oro, of unkaown depth or height. The upper levels will yiold ore eaough to keep the Sunderland and Pio neer mills ruaning.

CROWN POINT.—Still drifting east at the 1,100-foot level. Tho water flowing from the level above bas decreased very materially, allowing of better progress in tbis level. The west wall of the ledge will not be reached for some weeks yet.

GOULD AND CURRY.—The old workiags of the upper levels yield hetween forty and fifty tons of ore per day, assaying about $36 on the average. The quaatity will he increased when the secoad statioa drift is all cleaned out, which will he in two or three days longer. This drift is 750 feet in length. Drifting east through the ledge at the seventh station was resumed last Sunday, aad good progress is beiug made.

OVERMAN.—Progress after the usual style. Producing considerablo medium grade ore, hut no rich hunches. The Belcher and the Segregated Belcher prospecting as usual, and not raisiug aay ore to the surface.

IMPERIAL-EMPIRE.—Repairs to shaft progressing. The upper levels yield a limited quantity of good pay ore, yet not enough to pay current expenses without the aid of an occasional assessment.

OPHIR.—The drift west at the 700-foot level is now in 460 feet from the new shaft. The face is in rather more favorahle looking rock, yet no material change is perceivable.

HALE AND NORCROSS.—Yielding ahout 125 toas per day, principally from the fourth station. Shaft undergoing repairs.

LADY BRYAN.—This famous outside mine contiuues looking well. The annual meeting of the company will be held August 3d, at Virginia.

WHITE PINE.

FOR THE WEEK ENDING JULY 24TH.—The Mining Review of the *News* opens thus: Although the mines are running light on work, compared with the numher of men omployed previous to the effort to reduce wages to $4 per day, yet they aro lookiag better than at any previous period, and considerable prospectiag is going on in unopened claims. The contract system is working admirably—for the mine owners; while from 30 to 100 miners visit the outside mines weekly in search of employment at the wages offered. Owners, superintendents aad foremen, and even the men themselves, fear violence from the Miners' Union, and for this reason no one is engaged at $4. A counter organization is now talked of, for the purpose of protecting miners in their peaceful pursuits at whatevor wages thoy may be ahle to obtain and willing to work for. Not a mine has yet yielded to the demands of the Union, and from present appearances it is not likely that a singlo ono will. Coutracts have been let in all of those which temporarily suspended work, save the Eberhardt, aud many miuers so employed are not making the $4 per day.

BULLION.—Our hullion shipmeat for the week foots up $69,739.76—heing $23,038.53 more than that of last week, and $8,440.57 more than for tho week previous.

ITEMS.—*News*, July 19th: The Richmand, next the Eberhardt, has levied an assessmeat of $3....Mszeppa will start up to-day....Rock from Silver Vault Tunnel assays $55 in silver—some gold.....20th: Old Ned is sending ore to O'Conaor's mill. An assay went $113 to the ton....Natioual Tunnel is ia 104 feet....21st: A. P. Stanford is boriug an artesian well at his mill. ....The Earl Co. is shipping oro to one of the Shermantown mills....23d: There are uow 30 houses in Ophir City....Bassett & Co. have opened an assay office in Treasure City. Can work ore in lots up to a hundred pounds....Water compaay getting on well....*Empire*, 20th: Ten and a half tons of ore from the Virginia milled $1,407, or $134 per ton. Not selected.... 21st: The Brother Conover claim has been sold to New York parties for $30,000; no sale if not paid in 30 days....Pogoaip & Othello ore as good as ever....*Telegram*, 22d: We have to-day seen an assay receipt for Jenness ore which went $716 per ton....Mr. Bennett shows us a small bar from 25 lbs. Caroliue ore; value over $400 to the ton.

MILLS AND SMELTING WORKS.—*Empire*, 22d: The new mill of Logan, Lucas & Co. at Swausea commeuced operations yesterday. It is a rotary crusher, of the Howland pattern, and is said to have a capacity of 24 tons per day. The cost of the mill complete was about $20,000. It started on low-grade ore from the Low miae, Bromide Flat, and everythiag moved like a charm. ....*News*, 23d: The Metropolitan mill is now in complete runniag order. Its capacity is 15 stamps, 10 paus, 5 large settlers and a rock-breaker, with power and water sufficient to run everything night and day, crushing with ease 20 tons every 24 hours....The Uaion Co. are putting up tho Dayton mill aloagside the Manhattau—to be run by the same water....*Telegram*, 21st: Six wagons, with the greater part of the machinery of a 10-stamp mill arrived at Swansea yesterday....San Francisco parties are preparing to erect extensive smelting works uear Swaasca. If satisfactory arrangements can he made with mine owners, the work will be commenced at once, aad in one month several large furnaces will be in active operation.

OUTSIDE DISTRICTS.—*Telegram*, 22d: Work on the Lizzie Potosi and Miner's Dream in Cave District is progressing finely....An Indian came into Spriagville, in Patterson District, and said white men had struck very rich placer gold diggings on the Little Colorado....Martin & Davidson's mill at Patterson is progressing.... Specimens of gold-bearing rock from Pinto District which we have heen shown, are extremely rich....Rich chloride ore struck in Shoshone Distaict. A mill will be running by Sept. 1st....*Empire*, 23d: A new district discovered due south from Carlin and 60 miles from Hamilton. Assays of ore run up to the thousands. Many have left for the new discovery....*News*, 20th: Eno writes from Mineral City, Robinson District: "Old England is au immense lode of argentiferous galena, projecting 10 or 15 feet above the surface, and is of great width. Assays show from $100 to over $400 in silver to the ton. City of London, 60 rods distant, is equally large. Flying Cloud contains refractory ore, the ouly assay made giving $190 per ton. Isaac, is a lode oaly three feet wide; several assays made give from $150 to $360 per tou. The Elijah assays from $65 to $1,200 per ton."

Oregon.

QUARTZVILLE.—Dalles *Mountaineer*, 16th: G. A. Edes, returned yesterday from a trip to Santiam. There are a few men prospectiag iu the creek, and one company is doing work on the ledge, but lahor for the most part is suspended. The compauy which owned the quartz machinery are tearing it down and those portions that can he sold for enough to pay the expenses of bringing it out of tho mountains will be brought down.

EASTERN OREGON.—A Portland telegram of July 26th. says: A force of 700 Chinamen will he put at work immediately on Burnt River Mining Ditch. Seven miles of ditch drain are to be completed, and the ditch will open a large and valuahle miuing district.

Wyoming.

MINER'S DELIGHT.—Sweetwater *Mines*, July 14th: W. D. Matheny has purchased 718 feet of the Miaer's Delight ledge for $50,000. Mr. Matheuy will soon leava for tho East, for the purpose of organizing a company to work this claim.

The ore that is now being extracted from the 75-foot shaft on the Miaer's Delight is so rich that the owners have forhidden persous going to the dump and carrying it away. We were told that one or two gentlemen made several hundred dollars hy panning out some dirt they got hold of.

ITEMS.—Tozer & Eddy's mill is crushiag rock from the Sowles and Perkins ledge. ....Forty tons of rock from the Lady Washington ledge was unloaded at Mills & Engler's mill yesterday. This mill will commence crushiag quartz as soon as quicksilver arrives....Kidder & Mason's mill is ruaniag aight and day. The machinery works splendidly....The work oa the Poor Man's ledge is goiag ahead. At a depth of 20 feet there is a 3-foot vein, and free gold can he seen in ahnndaace....Chris. Smith and Geo. Donald have struck it on the Barnahy ledge "hig." They are uow extracting ore from a 5-foot vein, and it is rich—free gold and plenty of it....Mr. Dixson iaformed us that a day and night shift was working on the Nellie Morgan ledge, aad that excellent quartz was heing taken out. At the present depth—30 feet—there is a vein of two feet.

Utah.

OHIO DISTRICT.—The Elko *Independent* of 21st says: This new district is two hundred miles snuth of Salt Lake on a western spur of the Wasatch mountains. The ledges are well defined, and rich in hoth gold aad silver; besides considerable miaiag is doae for placer gold with fair success. A new county has beeu formed, named Piute, and quite a town has grown up at the principal miaing camp, called Virginia City. The ledges average from four to forty feet in thickness. Contracts have been made for the erection of two aew mills, one of twenty and the other of forty stamps. Theso mills will be shipped by way of Ogden and Salt Lake.

The Engineer of the Present Day.

The followiag is from an article on "The roads of New York Central Park," by Wm. H. Graat, Superintending Engineer: "We are aware that there are persons, tolorably well informed, who, from a habit of looking only in one direction, and that far, very far backward, have wrought in themselves a strong conviction, that to undertake a piece of work requiriag the employment of an engiaeer, is to embark in a career of extravagance and to inour uaknown outlay. An engiaeer's estimate is to them almost synoaymous with an ascending series of expenditures eading only with exhaustioa, and his plaas are regarded as ingenious refinements upon the old fashioned ways of doing things that are incoaceivable or useless. The impression canaot be eradicated with such persons that an eagineer canaot study or practice econony, whatever else he may do; his work, if perchance it turn out well in other respects, caunot, in any event, be a success as to cost—in other words, cannot be cheap. We say that this is simply a mistake. The profession has got beyond it. It is no longer the practice of the engineer; it is the malpractice of the pretender. The speed of the ocean steamer, the locomotive and the electric telegraph have advanced things somewhat. We are no longer in the past. A glance at the progress that has been made, within a very few years past, reveals greater achievements and successes and more substantial improvements, than any previous page of history can show. If there is any basis that is fundamental and has become well established in the business of the civil engineer, it is that his is the art of attaining with certainty the greatest ends with the least and most economical expenditure of meaas."

INCREASE OF VALUES.—The increase in the property valuation of New York from 1868 to 1869 was, in round uumhers, $50,000,000—representing a total of $908,000,000. The actual sale value of this property is estimated at $2,000,000,000. The increase in the income tax returns was $15,800,000, with 1,044 more income tax-payers. An increase closely corresponding to the above is reported in nearly all our large cities.

A MAMMOTH FAN.—Farwell Hall, of Chicago, is ventilated hy a gigaatic fan, weighing two and a half tous and making five hundred revolutions per minute.

Notices to Correspondents.

Skeptic, Marysville.—Missing formations in the geological series occur in many parts of the world and with numerous varieties of rocks of all ages. The study of the cause of these missing strata has not been systematically followed, but no doubt will be. Dr. Bigsby has recently made an able commencement of this branch of geological inquiry by a lengthy and interesting paper read recently before his brother members of the Geological Society, London. We have only room to quote the following: "Missing formations are amongst the several consequences of emergence and immersion, themselves the effects of one of the great cosmical agencies—oscillation of level—which may be gradual or paroxysmal, through all the degrees of velocity and energy."

Phœbus, Marysville.—Substances existing only in minute quantity, such as iridium, rubidium, etc., are detected by the spectrum analysis,—first, by evaporating the liquid containing such substance until the salt is obtained in a dry state. A portion of the latter is next introduced by a platinum wire into a colorless gas flame, the light from which is made to pass through a prism, and viewed through a small telescope, or spectroscope, as it is called. By the aid of this, one or more bright lines or bands are seen in the spectrum, which, according to their position, number and color, indicate the presence of different elementary bodies.

Explorer, Austin.—The discovery of cæsium,—so called from the bluish gray line, which it presents in the spectrum,—and rubidium, named from its forming two red lines in the same instrument,—were first discovered by Professor Bunsen, of Heidelherg, in the hot waters of Baden Baden and Durkheim. For this purpose it was necessary to evaporate fifty tons of water in order to obtain 2,000 grains of the two new metals. Taken together, their proportion to the water was only as one is to three millions.

Elastic.—A very excellent substitute for gutta percha, it is said, may be obtained in limitless quantities in the forests of British Guinea. One of the singularities associated with which, is stated to be that the tree producing the gum invariably yields the largest quantity at the full moon, at which period the yield is said to be from six to ten times more than at other periods. A similar gum is said to be obtainable along the Western Ghauts on the Malahar coast, India.

S. M., Calistoga.—During the great earthquke of Lisbon, a spring at Bagnéres de Luchon, in the Pyrenees, had its temperature raised 75°, or up to 122°, at which it now remains. It is also recorded that hot springs at Bagnéres de Bigorre, in the same mountains, suddenly became cold during an earthquake in the year 1666.

Liberal.—The Board of Trustees of the Yellow Jacket mine, have voted $2,500 for the living sufferers from the great calamity which befel that mine in April last.

The Pacific Railroad Terminal Shops at Sacramento.

Simultaneously with the completion of the great continental railroad there went up at Sacramento, a number of very substantial brick terminal buildings, for mechanical purposes, suited to the uses and commensurate with the vastness of the undertaking. The energy and thoroughness with which these buildings have been brought to completion were not inferior to the same qualities as displayed in the road-building. Passengers up and down from the interior since spring, have observed with pleasure the laying of extensive heavy granite foundations, and the rising of one of those immense round-houses which are seen at some of the great Eastern railroad termini, followed by other large buildings for unknown purposes to the passer-by. "Progress," since the completion of the road, is now in no other way so strikingly illustrated as by a visit to the shops. They are, in the main, completed, and in full blast.

The largest iron-working, and wood-working establishments in operation west of St Louis, or even Chicago, are located at Sacramento. Activity of organized labor, in the bustling of artificers that belong to such regions, is as well displayed, and as much at home, apparently, at Sacramento, as it is at Patterson, or at Nashua; but the work in hand that must fall to the western terminus, is evidently yet in its infancy, and is destined to grow to proportious beyond even the capacity of the present buildings.

It is only a few weeks since that the machine shop and the car shop have been fully supplied with the necessary machinery and been in operation; the round-house having, however, been in use for a number of months. Accompanied by the Resident Engineer, Mr. Joseph R. Wilkinson, we have made a visit which has resulted in the following notes:

There are now 160 locomotives at this end of the road—belonging to the Central Pacific Company—of which 29 can be accommodated at one time in the Sacramento round house. Its front measures 611 feet; its rear, 411 feet; depth, 64 feet, and hight 24 feet. Water for the engines is supplied from a side tower, called the oil house, in the top of which is a tank containing 65,000 gallons of water, and below the same, two stories for offices, and a cellar which holds seven great sheet iron 1,000-gallon reservoirs for oil, thus secured against fire. Amongst the host of locomotives stabled in the round house, one is pleased to encounter appropriate local names suggestive of the days of Pacific Railroad explorations, of trapping, and of the aboriginal interior which is now of the past.

The wood working and car manufactory is another collossal building 90x238 feet, of two collosal stories, with straining-beam truss roof, whereby the lower story is kept entirely free and unobstructed. There is also an L 45x90 feet. Mr. Ben. Welch, the superintendent, turns out now all the cars, including doors, windows, and upholstery, from California material, that the Central Pacific Railroad can require or use up, and at a cost quite as low as that of the same articles imported. Band saws and other of the most complete modern wood-working machines may be seen at work, too numerous for mention. On the second story are the offices of the Master Mechanic, Master Car Builder, the Superintendent of Motive Power and Machinery (Mr. E. F. Perkins), and of the Draughtsman, and various clerks.

The machine shop, of which Mr. George D. Welch, Master Mechanic of the Sacramento Division, has the direction, is 100x205 feet, beautifully roofed, and filled with superb iron working machinery adapted to railroad uses. This shop is intended to do all the iron work of the road but local repairing, for which shops have been built along the line—as at Rocklin, the "foot of the hill," where there is also a first-class granite round house, and where two or three additional engines are in readiness to join the single one that does duty for fifty or sixty cars between Sacramento and that place. In the machine shop there are eleven pits, adapted for locomotive repairs, and a traveling bridge by which locomotives can be picked up and lifted about like toys. Amongst the finer and special pieces of machinery, are a collossal lathe for turning locomotive driving wheels 6½ feet in diameter, a drill for boring out and smoothing the center of car wheels, nut-tapping machines, very large iron planing machines, a slot-cutting machine for keying pistons and the like, besides the usual multitude of ordinary iron working contrivances.

The finest engine on the coast furnishes the power,—a Corliss engine of 160 horse-power built at the I Street Iron Works in Sacramento, by the Pacific Railroad Company. Indeed, we are justified in claiming this engine as amongst the best pieces of workmanship of the kind in the United States—certainly we have seen nothing superior. Water for the entire works is furnished from two artesian wells thirteen inches in diameter and seventy-five feet deep (through sand and light alluvial material to a boulder formation at that depth, which holds highly ferruginous waters) being raised by two pumps worked silently by friction pulleys. The belt from the engine is twenty inches in width, ¾-inch in thickness, and ninety feet long. Chimney stack 92½ feet in hight.

A blacksmith shop 60x150 feet, to contain thirty forges and three steam hammers, completes the list of buildings now erected. All are of brick, but enclosed at one end with wood, with a view to extension whenever necessary. The ground on which the Pacific Railroad terminus is located has all been made, to a depth of nine to eighteen feet, having formerly been a lake.

The *personelle* of the Central Pacific Railroad Company has heretofore been published in the Mining and Scientific Press, and has not much changed, except in the location of operations. Mr. Butler Ives, the explorer and surveyor of the different routes that were conceived of or suggested between the Sierra Nevada and the Rocky mountains, and upon whose report not only the Central but the Union Pacific Company, on this side of Ham's Fork, laid the rails where we now find them, is employed on some map work for publication. Mr. A. S. Bender is now in charge of the Western Pacific Railroad construction, and Mr. Charles Cadwalader of the Marysville and Northern road construction. Mr. Gray, the consulting engineer, makes his headquarters at the company's office in San Francisco; Mr. Guppy, at Oaklaud; Mr. Haslitt is seeing to engine houses and stations on the line of the road. There are built engine houses at the Summit, holding ten engines, at Truckee sixteen engines, at Wadsworth twenty, at Carlin twenty, and at Winnemucca twenty.

A number of parties are out surveying between Marysville and Willamette Valley, Oregon.

The Coolie Question.—The Secretary of the Treasury has taken such action as will put an effectual stop to the projected coolie operations of Mr. Koopmanschap and the Memphis labor speculators. No agreements made in China for labor at ten and twelve dollars per month will be recognized by the courts of this country, and John Chinaman is too smart to continue to work for ten dollars after he arrives here and finds he can get twenty or or thirty. Chinese emigration will be protected only on its legitimate basis of free labor; as such, however, it will be protected at all hazards and at any cost; to *that* the government is bound by solemn treaty.

A National Bank Combination.

A bold movement is being made by the national banks toward consolidation, or rather toward coöperation, for their own interests as opposed to that of the people. They are said to be putting themselves on the basis of "armed peace." This movement, if rightly interpreted, is the most gigantic moneyed coöperation ever undertaken in the history of the world. The banks now number 1,629, with loans amounting to over $3,350,000,000, issued to over 1,750,000 persons. The power that may be wielded by this combination will be almost irresistible to whatever end it may be resolutely and judiciously directed. It will be able to collect millions of dollars in a week to accomplish any desired object which the managers may have in view. In these desperate days, when, according to common report, Congressional votes can be so freely and so cheaply bought, such a power behind the throne may well be dreaded. The object of the combination *may* be laudable and patriotic. One of the proposed objects is to save themselves from disaster during the convulsions which it is anticipated must attend the passage of the changing from a currency to specie basis. But will the interests of the *people* be thought of when the crisis comes? There is no telling what questions or issues may arise; and it is fearful to think what *might* be accomplished by a corruption fund, of the many millions which might be so easily raised, if placed in the hands of unscrupulous men. A skillful manipulation of Congress might place the people of the country more completely within the hands of these banks than they now are in the hands of their chosen representatives. The banks might hold the field triumphant, in spite of the people, for years, if they should so determine. We in California are happily, by our local specie banks, quite removed from any direct influence that might result from such a catastrophe; but we could not fail to be more or less indirectly affected by any catastrophe which might befall our friends and correspondents at the East. The movement is beginning to excite much comment throughout the Atlantic States.

The Powell Expedition all Right.

Letters have been received from Major Powell, of the Colorado River Expedition up to June 29th, at which time the party were all safe and lying by for a few days for rest. The party had passed four cañons, of about twenty-five miles each in length, the walls of which were from 2,000 to 2,800 feet high; were compelled to make portages of rations, etc., and let the boats down with lines. One of the boats was wrecked with the loss of a portion of the supplies and instruments. The instruments were duplicated. Some fine fossils have been collected, and a grand geological collection and a good map will be prepared. The boats seem to be a success; although filled with water many times, they never sink. The wreck was due to a misunderstanding of orders. The party was resting for eight or ten days to make repairs and dry rations. They were all in good health and spirits, and filled with high hopes of success. The Major is very anxious to make observations on the 7th of August, of the eclipse.

Mechanics' Institute.—The regular monthly meeting of the Mechanics' Institute will be held in the Institute building on Thursday evening next, August 5th. At a quarter past eight on the same evening the Polytechnic Association connected with the Institute will hold its second regular meeting, at which a paper will be read by Mr. W. B. Ewer, on "Explosives." After the reading of the paper, the subject will be open for general discussion. These meetings are open to all—free. The public generally is invited to attend.

Tule Reclamation—Sherman Island and the Roberts Enterprise.

A party of gentlemen from San Francisco, chiefly capitalists and engineers—in truth a very respectable and solid body, representatively—made a visit on Thursday and Friday of last week, July 22d and 23d, per steamer Dover, to Sherman Island, at the junction of the Sacramento and San Joaquin rivers, for the purpose of taking some notes in regard to the actual status of the reported successful reclamation of that island, from a financial and engineering standpoint; and to convince themselves of the practicability of extending similar operations on a methodical basis to other possible reclaimable lands, with so large an area of which our State is blessed—or cursed. A very legitimate enterprise of this kind, inaugurated by Geo. D. Roberts, for the purpose of reclaiming adjoining islands (Twitchell, Brannan, etc.), which has taken the name of the Tide Land Reclamation Co., was the origin and interested cause of the excursion, the object being to call the attention of those able to contribute to or in any manner interested in such reclamation, including the public at large, through the press, which was duly represented, to the importance of the results attained by the indomitable settlers of Sherman Island, organized under the Swamp Land Law of the State.

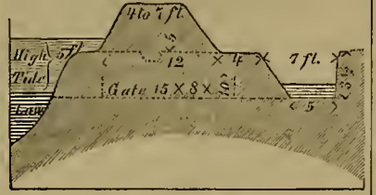
The party consisted of Messrs. Roberts, S. Heydenfeldt, Jr., L. Tevis, Wm. Doolan and W. C. Walker, of the Reclamation Co.; Messrs. Clark, Upham, Kimball, Boggs and Fuller, reclaimers and farmers of Sherman Island; and M. Derbec, L. Sainsevain, M. de Breyl, C. A. Sumner, P. Durkin, O. L. Chamberlain, Dr. C. D. Cleveland, Dr. Silver, B. S. Hartshorn, N. D. Townsend, W. S. Chapman, B. Fabian, J. L. Johns, A. B. Winegar, W. B. Carr, Amos Bowman, N. Hubert, C. D. Carter, Governor Purdy, C. H. Swain, Wm. M. Gwin, A. C. Peachy, C. McAllister, C. P. Crocker, F. Vassault, Edward Scott, Robert Watt, Adolph Sutro, Wm. Alvord, Joseph Roberts, Jr., C. H. Burton, W. F. Garvey, Chas. W. Howard, H. W. Seales, Chief P. Crowley, Wm. Hooper, Edward Curtis, R. M. Chamberlain, H. C. Robinson, Colonel Colton, Major Elliott, U. S. A., and several others.

Sherman Island, to be brief, was found perfectly reclaimed, so as to be adaptable for easy and successful cultivation; and many parts, including several immense fields at Mr. Boggs' place, were found in crops, the luxuriance of which secured the interest of, and gave satisfaction to, every one in the party.

The tule lands appear to be all alike, and all reclaimable, at more or less cost, depending upon the rise and fall—by freshet or tides—of the surrounding waters. Against tides, the muck soil of the tules is, when thrown up and well dried, sufficiently durable. Both at Sherman Island and at Twitchell Island, upon which the Reclamation Company have commenced operations, the dimensions of the levee are, in general, as given below, and now being carried out on the latter island by Capt. W. C. Walker, with a force of about 200 Chinamen.

The slope of the outside of the levee is obtained by the rule of "drawing in nearly a foot to every foot in hight;" the inner side being less steep. Six to seven feet is spoken of as the proper width at the top of the levee; but three to four feet is the practice, on Sherman Island at least. Contracts are let to the Chinamen on Twitchell Island at fifteen cents per cubic yard. Mr. Bigelow, on Sherman Island, had his land leveed (the job having been assigned to the land owners there under the Swamp Land act) at $3 per running rod; the hight, however, was only 3½ feet from the surface. From $4 to $5 per acre is the estimated average total cost—which is scarcely more than the cost of fencing. The gate-framings, with appurtenances, are reckoned at about $100 apiece, being 15x8x10 in dimensions, and double,—one gate swinging and self-acting, the other (for safety merely) sliding, and worked by hand. There are thirty on Sherman Island.

Of the highest importance in connection with the reclamations at the mouth of the Sacramento and San Joaquin, is the point that currents and floods of the freshet season do not have to be leveed against; the waters finding such spreading room in Suisun Bay—which begins at the lower end of Sherman Island—that a rise of fifteen feet at Sacramento is scarcely as much as a foot at Collinsville, Antioch, or Sherman Island. Only the tides, therefore, have to be leveed against; and if there should be a break at high water, the devastating current would not continue after filling up the island to flood mark, when the waters would again subside, after six hours, so as to admit of repairs.



TWITCHELL ISLAND LEVEE.

Though the levees should prove utterly inadequate, farmers and gardenere could afford, it is thought, to live on stilts during a portion of the year, in order to benefit by the two or three crops that can be raised with certainty during the dry season. The soil is inexhaustible—except by fire, which has been known to burn to a depth of a number of feet, including entire levees in its leveling process—an unwarranted encroachment of the element beneath the ocean level.

In regard to the value of reclaimed tule lands, we quote from Dr. Silver's report in the *Alta* of July 26th:

To what specialty is this reclaimed island adapted? We should say to market gardening; and San Francisco may rest assured of being forever safe for supplies of its vegetable markets, beyond all cities in the world, in quality, in quantity, and in prolongation of the season of supply. In every month of the year we can have our green things. The evil that made this island of little value before reclamation now turns to priceless advantage, viz: the fact that at high tide the water is above the level of the land. This now gives the land daily command of irrigation at pleasure, without exposure to undesired inundation. Rice finds here the exact conditions required for its growth, if there be not climatic obstacles yet to be revealed.

Travelers on the river steamers get no conception of the worth of these islands. They look like swamps, given over to tules, rushes, and submergence by tides and floods, beyond practical redemption. Yet nothing is simpler, nothing easier, than their reclamation. Sherman Island is the largest. It is 12 miles long, and it contains 14,000 acres of the richest land in the world. The Valley of the Nile is not excepted—rather it is challenged. This island, by means of Chinese labor, has been, in a single year, encompassed by a levee that completely protects it from further submergence. One is surprised to see how small an embankment suffices, and how quickly the swamp becomes dry land and how kindly its soil responds to cultivation. Five dollars per acre covers the cost of the enterprise, and advances the value from nearly zero to $30 in one season.

The soil of Sherman Island is dark river alluvium, mixed with thickly interlaced roots of tule and other water plants, which make the surface spongy. When the tide water is excluded these water plants cease to flourish, the surface dries, plowing is light work, and whatever is put in the ground takes on extraordinary growth, without distinction. Potatoes are large, dry, and mealy, and every kind of fruit thrives. Corn is very luxuriant. The depth of rich soil must be great, for a ten-foot stick goes down with ease, and shows the same moist, unctious, black mold all the way.

Sherman Island contains 14,000 acres. There about 200,000 acres of similar land adjacent, of which 120,000 or more is owned by the Reclamation Co. Twitchell Island (named after the engineer of that name, now Deputy Surveyor-General, to whom is due the credit of first determining the practicability of reclamation in this vicinity from an engineering point of view) contains 3,600 acres, and Brannan Island 5,000 acres. We may add that the impression was made upon our mind that the enterprise (originated by Messrs. Roberts & Kimball) is not to be taken as a narrow land speculation, but was conceived and intended to be carried forward on liberal principles, for the advantage of settlers, and in such a manner as to promise good to all interested or concerned.

New Books.

A PRACTICAL TREATISE ON THE MANUFACTURE OF PORTLAND CEMENT—By Henry Reid, C. E. With a Translation of M. A. Lipowitz's work, describing a new method adopted in Germany of manufacturing that cement—By W. F. Reid. Philadelphia: Henry Carey Baird, 1869. 8vo, pp. 110 and 78.

This book says everything that can be said about Portland cement, from the selection of the site for the manufactory, to the manner of using the perfected article. Every step in every process is given in detail. The use of the cement in building, in marine architecture, and in roadways, is fully described and illustrated. The subject is especially interesting to a Pacific Coast architect. It is generally understood here, and is the opinion of our most competent engineers, that we have nothing to fear from earthquakes of no greater violence than those already recorded, provided our buildings are workmanlike in their design and thorough in their construction. One of the essentials to this thoroughness is the use of good mortar. Books and facts upon the making of mortar have been in demand since the shake of last October. The more the subject is studied, the more evident is it that mortar-making is by no means work which may be entrusted to a hod-carrier, as is too often done. The life of the lime is first destroyed as effectually as possible; and the trash, yclept mortar, which is then made with it, becomes part and parcel of a building which falls upon the slightest quake, or even perhaps by its own weight. It is claimed for Portland cement, not only that there is an important saving in its cost as compared with lime, but that it can be supplied to the builders in such a state that it only requires to be mixed with water for use, and needs not to be manipulated by an ignorant laborer. This cement forms a part of the "Bétons Agglomerés" of Coignet, which is now an acknowledged success in France. It may yet be extensively used in the construction of our sea-wall, as well as of our earthquake-proof buildings. The book is for sale by A. Roman & Co. Price, $7.

A PRACTICAL TREATISE ON HEAT, AS APPLIED TO THE USEFUL ARTS; FOR THE USE OF ENGINEERS, ARCHITECTS, ETC.—By Thomas Box, author of "Practical Hydraulics." Philadelphia: Henry Carey Baird, 1869. 12mo, pp. 216.

This is a very complete work. It is hard to say who does *not* want it, to make up his collection of books upon his own specialty. Those who have anything to do with steam boilers, whether as makers or users; those who build chimneys or use them; architects; stove makers and all who use stoves; in short, all whose calling brings them face to face with the expansion or contraction of solids, fluids or gases,—the laws governing which they ought to know,—will in this book find the whole matter reduced to working figures. We promise to furnish our readers a valuable extract from it occasionally. But they should buy the book. For sale by A. Roman & Co. Price, $4.25.

ILLUSTRATED SAN FRANCISCO NEWS.—We have received the prospectus of a weekly and daily with the above title. The head is of elaborate design, and the style generally neat. The illustrations are to be zincographic. The first number will appear about August 1st.

Good Mining Management.

We have received from the Secretary of the Golden Rule (California) Mining Company, a copy of his report for the fiscal year ending July 13th, as submitted at the annual meeting on Tuesday last. This mine is located near Jamestown, Tuolumne County, Cal. The mill consists of fifteen stamps, and is driven by water power. The most interesting thing connected with this mine is the fact that it has paid nineteen consecutive bi-monthly dividend working all the time on low grade ores. During the past year, the total production of the mine has been 3,670 tons of ore, averaging only $6.05 per ton—a very low grade of ore on which to make dividends. The fact that such ore has been mined and worked to a profit by this company, is suggestive and important. We append the report of the Secretary for the past year:

From 1,285½ ounces bullion	$22,204 32
Sale of old iron	177 76
Sale of Sulphurets	200 00
Interest on reserve fund	1,303 74
Total receipts	$23,885 82
Cash on hand July 13, 1868	14,456 22
Total	$38,342 04

The disbursements for the year amounted to $28,415 80, as follows:

Mining and milling account	$18,347 19
Expense account	1,256 20
Dividend account	8,812 50
Total disbursements	$28,415 87
Cash on hand July 13, 1869	9,926 15
Total	$38,342 04

A QUARTZ MILL FOR JAPAN.—We have elsewhere spoken of the shipment of a quartz mill for Japan. The undoubted success of this first application of machinery to mining in Japan, will most likely bring to this city extensive orders for machinery of a similar nature for other mines in that country. The Japanese, it is well known, have extensive mines of almost every description, especially of iron, coal, copper, and the precious metals; but their superstitious notions, or ignorance of mining, has hitherto admitted of their being worked only in a most expensive and unproductive manner. In working their mines of gold and silver, it is said that they only take out as much bullion as is necessary for government purposes. Their contact with European nations, the knowledge which they will thereby obtain of the nature and value of the precious metals, in a national point of view, will undoubtedly lead to an early change in their policy—particularly when they find that by aid of machinery they can work their mines to any depth, and that there is very little or no danger of their immediate or ultimate exhaustion. They will soon learn the probable fact that before one mine can be worked out, half a dozen others will be discovered and opened, thus rendering the mines practically inexhaustible. The Japanese have a great aversion to underground work; and indeed such work has been well nigh impracticable to them, for the reason that they have no machinery for freeing their mines of water, or for hoisting. The water is all bailed out by hand, as we have already shown is done in China.

THE HOOSAC TUNNEL—SOMETHING FOR CALIFORNIANS TO THINK OF.—The Hoosac Tunnel is progressing in a most satisfactory manner. At the east end, the work has already been driven about 5,600 feet; 166 feet had been made during the three months previous to last report, and the rate of progress has now been increased to fifty feet a week. This improvement has been effected by increasing the number and efficiency of the drills. The contractors think they will be able to complete the work within three years—about one-third of the time named in the contract. All this is the result of the improvements recently introduced in tunnel engineering at the East and in Europe. Why is it that California is at a stand-still in improvements in a direction where, from her greater interests, she should take the lead?

Professional Cards.

J. S. PHILLIPS, M. E.,
CONSULTING ENGINEER,
Examiner of Mines, etc.,
423 Washington street.....San Francisco.
(Having had 33 years' experience in Europe and America,) supplies drawings and designs for Pumping, Hoisting, Crushing Separating, Roasting, Chlorinizing, Milling, Lixiviating, Precipitating, and Smelting Works. Minerals analyzed, and advice given for beneficial treatment. Lessons on the Discriminatiou and Assay of Minerals by Blowpipe, Chemicals, Scorifier and Crucible. 4v17tf

GEORGE B. ELLERY,
Practical Mining Engineer,

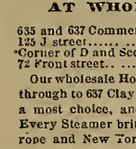
Corner of D and Second streets.....Marysville.
72 Front street.....Portland, Oregon.
Our wholesale House, 623 Commercial street, extending through to 637 Clay street, San Francisco, contains always a most choice, and the largest, assortment in this State. Every Steamer brings the latest issued novelties from Europe and New York, which can be found at all the above stores, at moderate prices. 23v16-3m

Blake's Patent.


THE BEST PUMP for Boiler Feeders, Breweries, Sugar Houses, Tanneries, Mining and Fire purposes, etc., is Blake's
Patent Steam PUMP
It is SIMPLE, COMPACT and POWERFUL, needs no expert to run it, and will start at any point. Is warranted POSITIVE under all circumstances. Send for a circular. W. O. M. BERRY & CO., 114 California St., San Francisco, Cal.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adopting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

Metallurgy.

MOSHEIMER'S
PIONEER MINING SCHOOL,
—AND—
METALLURGIC WORKS.
Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of
Chemistry, Assaying and Metallurgy,
That I am prepared to teach all the above branches in less time than in any European School.
I also undertake to assay and work any kind of ore, or mineral substances.
For terms, apply to **JOS. MOSHEIMER,**
Practical Chemist and Metallurgist.
Office, 328 Montgomery street; Metallurgic Works. 2005 Powell street, San Francisco. 6v18-6m

LEOPOLD KUH,
Assayer and Metallurgical Chemist,
(Formerly of the U. S. B. Mint, S. F.)
Office, No. 611 Commercial Street, opposite the Mint, San Francisco.
BULLION MELTED AND ASSAYED.
The correctess of which is guaranteed in every respect All kinds of Ore and Mineral tested, assayed and analyzed in the most satisfactory manner.
Refers by permission to W. C. Ralston, Cashier Bank of California; Messrs. Pioche & Bayerque, Wm. M. Lent, John D. Fry, E. Cahill & Co., A. K. Grim, President Pacific Union Express Co.; John M. Eckfeldt, M. and R. U. S. B. Mint: Hale & Norcross S. M. Co., and the principal mining companies on the Comstock Lode. 25v17-tf

PROF. HENRY WURTZ,
Formerly Chemical Examiner in the U. S. Patent Office may be employed professionally as a SCIENTIFIC EXPERT. Geological Examinations and Reports, Analyses and Assays, etc., etc. Practical advice and investigations in the Chemical Arts and Manufactures. Invention and examination of new chemical methods and products. Address, 26 Pine street, Rooms 35 and 36, New York. Always in from 12 to 3.30. ☞Written communications preferred.

Important to Gold and Silver Miners and Companies.
PROFESSOR WURTZ,
Who is the Inventor and Patentee of the new and wonderful uses of SODIUM IN WORKING GOLD AND SILVER ORES AND JEWELERS' SWEEPINGS, will furnish at the above address information in relation thereto, together with experimental packages of
SODIUM AMALGAM.
All instructions and experiments elsewhere obtained are spurious and unreliable. WORKING EXPERIMENTS ON AMALGAMATION OF ORES, Etc. Prof. W. has in operation in New York a large and small Hepburn Pan, for working 1,000 or 20-lb. charges of material for experimental purposes. 3v17-1y

R. TAYLOR. WM. H. TAYLOR.
ROBERT TAYLOR & CO.,
METALLURGISTS.
SMELTING WORKS,
Twelfth street, between Folsom and Howard.
GALVANIZING.
Also, Anti-Friction, Alloys for Journals, Type and Stamping Metals, Tinners and Plumbers' Solder, Etc.
☞The best price given for the most rebellious or refractory ores. Ores and minerals assayed and analyzed.
ISAAC BLUXOME, Agent,
4v18-3m N. E. cor. Washington and Battery streets.

G. W. STRONG,
ASSAYER AND WORKER OF ORES,
No. 10 Stevenson street, near First, San Francisco.
Highest price paid for choice lots of Ores, Sulphurets, Assay Ashes, Sweepings, etc., etc. Students instructed in all branches of Metallurgy, on liberal terms.

To Quartz Mining Companies.
To be sold positively within the next three months—the MINES, ENGINE, MILL, and entire Machinery of the TEMPLAR NO. 2 Quartz Mining Company, located at Indiana Ranch, Yuba County, consisting of—
One Steam Engine, 60-horse power, made by Burden, Brooklyn, New York.
Two large Boilers, in complete order.
One Eight-stamp Battery.
One Chile Mill.
One Cornish Lift-Pump, 6 inches, of superior make and finish.
280 feet of 5-inch Iron Suction Pipe.
One large Water Tank.
And also all of the necessary machinery, with Belting, Feed Pumps, Hose, Turn Tables, Cars, Ropes, Track Iron, Flumes, Plates, with Blacksmith Shop and all Tools and requisite implements to be found in a large and first class quartz mill.
The Company having ceased operations intend selling off their effects as speedily as possible.
For Particulars as to price, etc., address, by letter or otherwise, L. W. CAMPER, at Indiana Ranch; GEORGE B. HORNISH, Marysville; or E. W. HASKELL, Pacific Fruit Market, San Francisco. 24v18-1m

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the PRESS from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

Resources & Developments

IRON ORE FROM PLACER.—The Placer *Herald* of the 24th inst. says that Brown & Co., a company owning an extensive iron ore deposit, have been shipping ore to the Pacific Rolling Mills in San Francisco, where it is pronounced the best and purest ore yet tried in the State. An order was received, and some twenty tons shipped; which, smelted, yielded about 76 per cent. of pure iron. The iron furnace connected with these mills has been trying the Shingle Springs ore, but find it too poor to pay, and has commenced ordering exclusively from the Placer mine. This mine is about six miles from Auburn, is convenient to the Pacific Railroad at Clipper Gap, and is inexhaustible, there being from forty to one hundred acres of almost solid iron ore exposed on the surface, and reaching down to an unexplored depth. Should freights reach a point to make it profitable to quarry and ship this ore, the mine will supply the entire wants of the State.

THE following is from the Downieville (Sierra Co.) *Messenger* of the same date: We learn that an effort is being made to get capitalists to take hold of the iron mine at Gold Lake and put up reduction works near there. An agent was up here a few days since and took below some very fine specimens of ore, some of it assaying 90 per cent. A cubic foot in one specimen weighed 200 pounds. There seems to be nothing wanting in the locality to facilitate the production of iron in paying quantities. We trust this vast bed of mineral wealth may not be allowed to lie idle much longer.

MORE IRON FROM OREGON.—Another installment of 225 tons of pig iron has recently been received in this city, from the Oregon Iron Works.

THE third ship has gone to Vallejo to load wheat for Liverpool. Thus far this season no attempt has been made to ship in bulk.

BULLION PRODUCT.—The bullion product of the mines on the Comstock lode for the first six months of the present year were $3,955,701, showing a falling off of about $400,000, from the same time for 1868. This decrease has been occasioned by the rush to White Pine, and the disastrous fire which closed up two of the most productive mines for several weeks.

EUROPEAN IMMIGRATION.—The Sacramento *Union* very truthfully says that the great reason why so small a portion of the tide of European immigration fails to find its way this side of the Rocky Mountains, is because of the buying up of all our best farming lands by speculators, who hold them at an advance of 200 and 300 per cent. Immigrants will not pay such prices when they can do better by stopping in the Mississippi Valley. The high railroad fare also comes in as a make weight in the same direction. The railroad, we presume, will soon come down; but may we look for such a course on the part of the land speculators? We fear not.

WILD BEES are becoming numerous all through the Southern counties of the State. They are storing up immense quantities of honey, which the people of those regions are appropriating to a good use. Wild honey may soon become an important product of California.

PROFITABLE STOCK RAISING.—Gen. Bidwell has recently sold 1,000 head of stock for the snug little sum of $25,000; all the product of the past four years—a hint to those who are not in haste to grow rich.

FLOWING STREAMS have lately been struck in two artesian wells, one near Salinas City and the other in San Gabriel Valley.

SAN FRANCISCO SAVINGS.—In no city in proportion to its population, do the Savings Banks show such large deposits as in San Francisco. The number of depositors in the eight savings banks in this city and the three oldest in the interior is 35,749; showing an increase of over 2,000 in six months. The amount of deposits is $26,608,069—or an average of over $740 to each depositor. It should be borne in mind, in this connection, that all our homestead associations are of the nature of savings banks, and that through their aid there is now a larger number of real estate holders in San Francisco, than in any other city in the world—almost every male adult permanent resident, owning one or more city lots or homesteads.

INTERIOR SAVINGS.—The recent organizations of saviugs banks in the interior, has been attended with most excellent results. The first of these institutions went into operations a little over two years ago, at Sacramento. A few months later similar banks were started at Stockton and Oakland respectively; and still later at San José. Within a few months a second savings bank has been organized at Sacramento and Oakland. Organizations of the kind have also been formed at Marysville and Los Angeles. The banks of Sacramento, Stockton and Oakland are the only ones which have thus far made any public returns of their operations.

CHEAPER COAL.—There is a probability that the people of this city may soon be able to burn coal from Bitter Root (Rocky Mountains) of a better quality, and cheaper in price than it is now laid down here from Mount Diablo or Oregon. The Central Railroad Company, appreciating the great advantage which must be derived from cheap coal in developing the resources of the State, have wisely decided to make a special reduction in the freight of that commodity. This will be carried out if the Union company does not "fly the track," as they have heretofore done, in almost every effort which the Central has made to reduce charges, and to otherwise more fully reach and supply the necessities of the people on this coast.

GLOVE MAKING.—G. C. King is manufacturing a very superior kid glove, in Grass Valley.

THE GOLDEN ERA.
Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.
THE GOLDEN ERA
is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

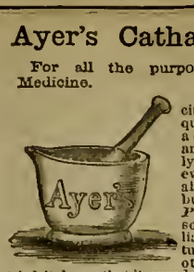
Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding months of delay requisite in transacting business through Eastern agencies.

Ayer's Cathartic Pills,
For all the purposes of a Laxative Medicine.



Perhaps no one medicine is so universally required by everybody as a cathartic, nor was ever any before so universally adopted into use, in every country and among all classes, as this mild but efficient purgative *Pill*. The obvious reason is, that it is a more reliable and far more effectual remedy than any other. Those who have tried it, know that it cured them; those who have not, know that it cures their neighbors and friends, and all know that what it does once it does always—that it never fails through any fault or neglect of its composition. We have thousands upon thousands of certificates of their remarkable cures of the following complaints, but such cures are known in every neighborhood, and we need not publish them. Adapted to all ages and conditions in all climates; containing neither calomel or any deleterious drug, they may be taken with safety by any body. Their sugar coating preserves them ever fresh and makes them pleasant to take, while being purely vegetable no harm can arise from their use in any quantity.
They operate by their powerful influence on the internal viscera to purify the blood and stimulate it into healthy action—remove the obstructions of the stomach, bowels, liver, and other organs of the body, restoring their irregular action to health, and by correcting, wherever they exist, such derangements as are the first origin of disease.
Minute directions are given in the wrapper on the box, for the following complaints, which these *Pills* rapidly cure:—
For **Dyspepsia** or **Indigestion, Listlessness, Languor** and **Loss of Appetite**, they should be taken moderately to stimulate the stomach and restore its healthy tone and action.
For **Liver Complaint** and its various symptoms, **Bilious Headache, Sick Headache, Jaundice** or **Green Sickness, Bilious Colic** and **Bilious Fevers**, they should be judiciously taken for each case, to correct the diseased action or remove the obstructions which cause it.
For **Dysentery** or **Diarrhœa**, but one mild dose is generally required.
For **Rheumatism, Gout, Gravel, Palpitation of the Heart, Pain in the Side, Back** and **Loins**, they should be continuously taken, as required, to change the diseased action of the system. With such change those complaints disappear.
For **Dropsy** and **Dropsical Swellings** they should be taken in large and frequent doses to produce the effect of a drastic purge.
For **Suppression** a large dose should be taken as it produces the desired effect by sympathy.
As a *Dinner Pill*, take one or two *Pills* to promote digestion and relieve the stomach.
An occasional dose stimulates the stomach and bowels into healthy action, restores the appetite, and invigorates the system. Hence it is often advantageous where no serious derangement exists. One who feels tolerably well, often finds that a dose of these *Pills* makes him feel decidedly better, from their cleansing and renovating effect on the digestive apparatus.

Pacific Mail Steamship Co's
STEAMSHIPS FOR
NEW YORK, JAPAN AND CHINA.
LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.
On the 10th, 17th and 30th of each month that has 30 days.
On the 10th, 18th and 30th of each month that has 31 days.
When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 17th falls on Sunday, they will leave on the Monday following.
Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.
Departure of the 17th or 18th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.
The following Steamships will be dispatched on dates as given below:
July 9—GOLDEN CITY.....Capt. Wm. F. Lapidge,
Connecting with ALASKA, Capt. Gray.
July 17—MONTANA.....Capt. E. S. Farnsworth,
Connecting with HENRY CHAUNCEY, Capt. Connor.
July 30—COLORADO.....Capt. Wm. H. Parker,
Connecting with ARIZONA, Capt. Maury.
Passengers berthed through. Baggage checked through. One hundred pounds allowed each adult.
An experienced Surgeon on board. Medicine and attendance free.
These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.
Through Tickets to Liverpool by the "Inman" and "National" Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.
For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.
No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.
The Steamship GREAT REPUBLIC, Capt. Cavarly, will be dispatched for YOKOHAMA and HONGKONG on SATURDAY, July 3d, 1869, at noon connecting at YOKOHAMA with the steamer NEW YORK for SHANGHAI. Shippers of freight to China or Japan are requested to mark on each package its destination.
For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.
OLIVER ELDRIDGE, Agent.

TRADE MARK.

New Almaden Vichy Water,
(CALIFORNIA VICHY WATER.)
FROM THE SPRINGS,
NEW ALMADEN,
Santa Clara County.
F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.
OFFICE, 508 JACKSON STREET,
GENERAL DEPOT:
Corner of Jackson and Montgomery streets.
This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the venous circulation.
It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of the Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.
California Vichy Water is used with success in many cases, such as:
Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.
(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.
PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.
Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

Mining Property for Sale.
A Two Thirds Interest
OF THE
Golden Rule Mining Company's
Claims and Mill,
Situated in Tuolumne County, California, two and a half miles south of Jamestown, on the Great Mother Quartz Lode. A good 15-stamp Water Power Quartz Mill is situated on the property, with a never-failing supply of water, as can be shown by the last four years continual running. This Claim has three parallel Ledges, from 50 to 100 feet apart, averaging from two to six feet in width, with a length of six hundred feet. They are so situated that a tunnel has been run through them at right angles, making a surface drainage of from seventy to eighty feet in depth on the mine. The mine is well ventilated by shafts from the surface, and well timbered so far as worked. In the mine are Steam Hoisting Works, capable of hoisting from a depth of 300 feet. A force of thirteen men only are required to keep both mill and mine running regularly.
On the surface and flats for a distance of 500 feet from these veins, the ground or surface was mined by placer miners, in former years, producing from two to five ounces per day to the man, during the season when water could be obtained, which factgoes to prove that a heavy deposit of ore was once contained in the croppings of these shutes, which, by all former and present theories of deep mine workings, came from below, indicating that when sunk upon to a proper depth, the lead will develop a mine equal to the Amador or Eureka.
This claim has paid its 19th regular dividend of $1,500 each, during the past four years, besides all the construction and other expense account, and has levied no assessments during the same time, and at present has on hand $8,000 in the Treasury, and no debts.
The last level 150 feet from the surface rock, averaged $7 per ton, on which was a profit of from $1 to $1 50 per ton. The length of the two shutes of ore on the east vein, and the only one worked upon, has been about 200 feet.
Now I propose to sell two thirds of this valuable property for $16,000, cash; and any party who desires to purchase a property of this kind—which theory has proven that it requires depth, on well known shutes of ore, for a sure fortune—can obtain a chance here, providing he or they will go down a sufficient depth. No purchaser is solicited unless he first goes and examine the mine, or sends a mining engineer in whom he can have confidence, to indorse what he may think proper of what has been here stated.
For any further particulars, direct by letter to Wm. Bosworth, San Francisco, P. O. Box 1978, or at my office, room No. 5, over Donohoe & Kelly's Bank.
22v18tfqr WM. BOSWORTH.

A Long Desired Article
FOR CLEANING THE HEAD AND HAIR. THE CLEANing of the head and hair has been the subject of consideration for a long time. This object will be accomplished by using
CAMILLE CHAMPNO,
which not only does away with the poor soap so offensive to use, and so injurious to the hair, but it cleans the head, strengthens and beautifies the hair, preserves the color and prevents baldness. It is cooling in nature, and can be used with safety and reliance on the smallest infant. Price 50 cents per bottle. Prepared by EMERTON & LUELLING, 773 Mission street, San Francisco, Cal.
HEATHFIELD & BOGLE, Wholesale Druggists, 206 and 208 Battery street, San Francisco, Sole Agents for the Pacific Coast. 24v18-3m

The Chinese Mining Tax.—The Chinese miners of Boise County, Idaho, have made up a case to test the validity of the $5 monthly, foreign miner's tax. Able counsel has been engaged on both sides; and the case, in all probability, will not stop short of the U. S. Supreme Court. In the meantime the defendant (County Foreign Tax Collector) has been restrained, by order of the Court, from any farther collections. The objections to paying this tax are based on the Burlingame treaty. This will, in all probability, prove to be one of the most important lawsuits ever tried on the Pacific Coast; and the decision in the case will be looked for with much interest, throughout all the States and Territories west of the Rocky Mountains. The mining counties are especially interested therein; as an adverse decision will fall heavily upon their pecuniary resources, already, in many cases, at a disastrously low ebb.

Vallejo.—A correspondent sends us a few notes from Vallejo, from which we infer that times are quite lively there, just now. The Grain Elevator, on which that growing, busy town especially prides itself, is working to the satisfaction of all parties. The government works, at Mare Island, are in full blast, over 1,000 men being employed in the various departments. The hotels, of which there are three or four, are full to overflowing, Our correspondent was compelled to pay a dollar for stretching himself for the night upon a lounge two feet too short for his limbs; when, as he afterward learned, excellent accommodations might have been had for less price at either the "Capital" or "Washington." He made a note of the fact for the benefit of other readers of the *Press* who might travel that way.

The Coming Blasting Agent.—Perhaps gun cotton will yet be fixed upon as, all things considered, the least objectiouable of the explosives. It can he burned loose in the hand without danger; while if confined, and exploded hy percussion, its dynamic power is equal to that of nitro-glycerine. It can be transported without fear of prematnre explosion, and will not freeze. This last recommendation will have force with those who recollect the several fearful accidents which have occurred from the heating of nitro-glycerine cans, in order that their conteuts may flow more readily.

Off for a Trip.—James Pollack, Esq., Superintendent of the Stone Dry Dock at Hunter's Point, in this city, goes overland on a brief business and pleasure trip to the Eastern States. Mr. Pollack is one of our foremost and persevering master mechanics. His services have necessarily been very active in building aud getting into succesful operation here the finest etoue dock in the United States, and we are pleased to note that he is taking a short respite away from his exceedingly vigilant post of duty.

Artificial Ice Manufacture in New Orlbans is pronounced a complete success. The establishment turns out 1,344 cakes of ice eighteen inches long, twelve broad and two thick, at each charge. The ice is said to be much firmer than most natural ice. Tho cost is not giveu, but the factory is a joint enterprise, and is said to be paying well.

Sacramento Female Seminary.—We have received a copy of the annual catalogue of the Sacramento Female Seminary for 1868-9. This school, judging from the number of its members, must be in a flourishing condition. We notice 105 names of pupils in the catalogue, without taking into account the juvenile department.

The French Cable has beeu successfully laid, and congratulatory messages have been exchanged through it betwecn the Emperor Napoleou and President Grant.

New Incorporations.

Elko and Idaho Toll Road Co.—Nev., July 19th.—Capital stock—$25,000, divided into 500 shares. Trustees—S. B. Wyman, — Carter W. Oppenheimer, J. D. Treat; Superiuteudent, O. R. Johuson.

Gold Run.—A correspondent writing from Gold Ruu, near Golconda Station, Humboldt county, Nev., says the veins of that district can he traced for miles. They are several in number. Everywhere along the line of the veins, and below their outcrop, are to be seeu large masses of "trachyte," which have evidently come from the vein itself. Our correspondent infers that the veins are true fissures. Iu some places the vein matter appears to have flowed from the vein down the hill, a hundred feet or more. It is necessary that observations of that character should be made with a great deal of care before venturing upon conclusions. He adds that the veins thero are well-defined, and show a large quantity of low-grade ores, and thinks that when the White Pine excitement gets sobered down to working mines for their intrinsic value, Gold Run will be found valuable for the quality of its ores and the permanency of its mines. We should be pleased to receive the specimens to which our correspondeut alludes.

High-Handed Acts at White Pine.—The members of the Miners' Union at White Pine visited all the principal mines of that locality on Wednesday last, and the $4 men were everywhere driven out. Even miners working on coutract at miues where other men were working for $4, were compelled to stop work. The men working in the blacksmith shop under similar circumstances, were also made to stop. Men were compelled by force to fall in and "march" with the members of the Union. This information was received after our White Pine Summary had gone to press.

Steven's Electro-Magnetic Settler.—We notice the statement in the Shermantown *Telegram*, that one of the above-named machines has been put up in the new mill of Logan, Lucas & Co, at Swansea, White Pine District. This mill has just been started, and will, probably, says the *Telegram*, be kept constantly employed.

Spots on the Sun.—No less than thirty three spots were counted on the suu by the celebrated astrouomer Father Secchi, on the 7th of June. A most unusual number.

Inventions and Patents.

New Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

Copies of U. S. Patent Claims furnished immediately at small cost. Full copies of American or Foreign Patents can be obtained by telegraph or mail through this office at favorable rates.

For the Week Ending July 20th.

Combined Harrow and Cultivator.—William J. Funk, Portland, Oregon, assignor to himself and Harrison B. Oatman, same place.—92,714.

Watch-Wheel Holder.—August Wilhelm Kientoff, Oakland, Cal.—92,729.

Curtain Fixture.—J. W. Foard, San Francisco, Cal.—92,812.

Animal Trap.—Daniel Harwood, Dutch Flat, Cal., assignor to himself and Seth White, same place.—92,823.

Ore Concentrator and Endless Sluice-Blanket.—Charles D. Smith, Drytown, Cal.—92,893.

This invention relates to a new and improved concentrator for separating the richer portions of pulverized ore from the gangue or refuse matter, after it has passed through the mill, aud consists of an endless belt covered with strips of blanket with alternate strips of metal, stretched by two drums, one at each end, and supported by a third in the middle. This belt moves toward the stream of water bearing the ore. One of the drums is adjustable, so that the belt may be inclined at any angle desired. The lighter portions of the stuff flows off at the lower end, while the heavier, being carried over the upper drum, are washed off by a stream of water which is brought to bear upon the helt from beneath. A series of hammers are arranged on the interior of the belt, so as to strike it, and by the jarring produced causes any of the sulphurets which may have clung to the belt to fall off. We shall probably give a more full description of this invention at a future time, accompanied by an illustration.

Fleece-Bundling Apparatus.—Jas. Walton, Roseburg, Oregon.—92,916.

Sleeping Car.—M. Allison Wheeler, San Francisco, Cal.—92,919.

Foreign Incorporations.—The following is from the *Inland Empire*, White Pine, July 24th: "The last Legislature of this State enacted a law providiug that 'every incorporated company or association created and existing under the laws of any other State, or any foreign Government, shall file in the office of the County Recorder of each county of this State, wherein such corporation is engaged in carrying on business of any character, a properly authenticated copy of their certificate of incorporation, or the Act or law by which such corporation was created, with a proper certificate of the officers of the corporations, as to the genuineness of the same, aud to each of such certificates shall be appended a duly certified list of the officers of such corporation.' The law went into effect July 1st, and the penalty for a non-compliance with its provisions is $500."

The journal aforesaid gives the names of 93 incorporations which have complied with this law, as appears by the books of the Recorder.

Address Wanted.—We are desirous of communicating with Allen Oliver, lately of Jamestown, Tuolumne County California. tf

Returned.—Dr J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco Every picture warranted to give satisfaction. 10v18 6m B. F. Howland.

Dr. Hall has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs Curling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Dewilz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18-3m

Cholera—How to Cure it.—At the commencement of the diarrhœa, which always precedes an attack of the cholera, take a teaspoonful of the Pain Killer in sugar and water (hot if convenient), and then bathe freely the stomach and bowels with the Pain Killer clear. Should the diarrhœa or cramps continue, repeat the dose every fifteen or twenty minutes till the patient is relieved. In extreme cases two or more teaspoonfuls may be given at a dose. The Pain Killer, as an internal remedy, has no equal. In cases of Summer Complaint, Dyspepsia, Dysentery, Asthma, it cures in one night by taking it internally, and bathing with it freely. Its action is like magic when externally applied to Bad Sores, Burns, Scalds, and Sprains For Toothache, don't fail to try it. In short it is a *Pain Killer*.

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

REOINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents. jy1m

New Advertisements.

Office of California Powder Works,
San Francisco, July 15, 1869.

NOTICE.

On and after this date, and until further notice, the price of BLASTING POWDER will be two dollars and fifty cents ($2.50) per keg.

Sporting, Cannon, and Musket Powder, sold at greatly reduced rates.

Information for Inventors and Patentees.

AN EXTRACT

From the American and Foreign Patent Agency Circular of the Mining and Scientific Press, Dewey & Co., Publishers.

Assignments.

We make out assignments in the most substantial legal and improved forms, record the same in the Patent Office at Washington, and return the papers to the assignee, at a total cost of $5.

Assignments of extra length or of a special character, will be made out and recorded on the most favorable terms.

Assignments already made will be examined and opinions rendered regarding their validity, and the assignments recorded, when desired, for a moderate fee.

Home Counsel.

We are frequently consulted by persons who have rejected cases which they sent months previous through distant agencies—(hastily paying their first and last government fees, expressage, and extraordinary charges of agents)—when we could have shown in the start precisely similar drawings and descriptions in the Patent Office Reports in our office, thus saving such applicants their useless expenditure of money and their long suspense.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive free advice of importance to them, from a short call at our office.

Interferences.

INTERFERING APPLICATIONS are conducted with spirit and ability on the most favorable terms, by DEWEY & CO. It sometimes happens that an applicant finds his invention has been patented by another, but more recent discoverer. In such cases the prior discoverer can obtain full right to the invention if he can produce tangible evidence of priority.

When patentees are threatened with interference they should consult able and responsible agents before they either allow themselves to be bucked down from their rights, or trespass upon the rights of others. We will always counsel and advise in such cases upon the most reasonable terms—often saving clients heavy damages and exorbitant fees.

Copies of Patents.

Full copies of U. S. Patents will be furnished in the shortest time possible, at favorable rates.

Copies of the claims of U. S. Patents will be furnished without delay, from the reports in our office, at trifling expense. State the name of patentee and assignees, and date and No. of the patent, if possible.

Copies of Patents in foreign countries expeditiously furnished at moderate rates.

EXTENSIONS.—U. S. Patents issued prior to 1861, are subject to extension for seven years, provided some ostensible reason can be shown the Government for so doing. Patentees who have, from circumstances beyond their control, been deprived of the full benefit of their patents for any considerable time, are usually successful in obtaining an extension of the same, when presented through our agency.

INFLUENCE AT WASHINGTON.—No inventor can possibly have better facilities or more influence (through friends or agents, at Washington or elsewhere), to secure their patents sooner or more surely, than ourselves. Our influence at Washington is unrivalled, so far as success for applications from the Pacific States and Territories are concerned.

Illustrate your Inventions.

One of the best means—and the cheapest, too—for eliciting attention to a new invention, is that of illustrating and describing it in the columns of the MINING AND SCIENTIFIC PRESS. To do this in the case of a meritorious improvement (and none other will be accepted), will cost our patrons no more than the price of a first-class engraving.

Superior Engraving Done.

We also take especial pains in furnishing engravings and electrotypes of superior merit, of all kinds, at fair rates, and tender our patrons the benefit of our practice and experience, by advice and assistance, in getting up their circulars, advertisements, etc.

With a poor representation we desire to have nothing to do, as it would be calculated to injure both the inventor and ourselves.

Too many ingenious inventors lose the product of their genius and labor by not bringing their improvements conspicuously or plainly enough before the public—the general reading public.

☞Our Illustrated Pamphlet, from which the above is an extract, will be furnished free on receipt of postage stamp. Confidential advice given, and every legitimate branch of Patent Soliciting business promptly and faithfully executed, by

DEWEY & CO.,

Publishers Mining and Scientific Press, 414 Clay street, San Fraacisco.

Kustel's Treatise on Concentration of all kinds of Ores.

Including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally. Illustrated with 120 Diagrams on 7 Plates.

CONTENTS:

I.—INTRODUCTION.

1. The Dressing.—Dressing of Ores; Principles of Dressing; Division of Dressing.

2. The Separation.—Separation of Gangue from Ore in the Mine; Dressing of Ores ontside the Mine; Separatiou by Hammers; The Ragging; The Spalling; The Cobbing; Separation by Hand; The Picking.

3. Cleansing and Sizing Contrivances.—Washing and Sizing; Stationary Apparatus; The Sluice; The Kiln; The Step Sluice; Movable Machines; The Hand Riddle; The Rocker; The Circular Hand Riddle; Swinging and Jarring Riddles; The Jarring Riddle.

4. Rotary Sizers.—The Trommel or Drum; Cylindric Trommel; Prismatic Trommel; Conical Trommel; Combined Trommel; The Sifting Wheel; Sizes of Grains for Jigging.

II.—REDUCTION.

1. Reduction of Ores.—Reduction of Ores to a Proper Size; Breaking under Heavy Stamps; Reduction by Rock Breakers; Hanscom's Crusher; Blake's Quartz Breaker; Reduction by Stamps.

2. Descriptiou of Batteries.—The Foundation; Mortar Blocks; Frames; Iron Frames; Howland's Rotary Battery; The Straight Iron Battery; Bryant's Battery; Wright's Iron Battery.

3. Details of a Battery.—The Mortar; Stem or Lifter; Shoe or Pestle; Socket or Head; Tappet; California Tappet; Cams—Wooden Cams; Iron Cams.

4. Speed, Curve and Order of Lifts.—Limit of Speed in Crushing; Construction of the Cam Curve; Order of Successive Stamp Lifts; Hanging-up of Stamps.

5. The Discharge of Batteries.—The Discharge in Dry Crushing—with Grates; without Grates; with Sieves; Dust Chambers; The Discharge in Wet Crushing — the Grates and Screens.

6. Feeding of Batteries.—Hand-Feeding; Stationary Hoppers; Movable Hoppers; Quantity of Water for Crushing; Remarks on Speed and Weight of Stamps.

7. Reduction by Rolling Mills.—Construction of Rollers; The Frame; Feeding of Rollers; Remarks.

8. Grinding.—The Arastra or Tehama; The Edge or Chili Mill; Ball Mills; Lundgren's Pulverizer: Cylinder Mills; Ferrand Mill; Hopkins' Grinder; Horizontal Mills; Iron Pan Grinders.

9. Pans with Plane Mullers.—The Common Pan Grinders; Tub Grinder; Bartolo's Grinder; Knox's Pan; Varney's Pan; Wheeler's Pan; Union Grinder; Moore's Qnartz Grinder; Gaston's Grinder.

10. Pans with Conical Mullers—Hepburn & Peterson's Pan; Belden's Pan; Baux & Guiod's Grinder.

11. Pans with Tractory-Conical Mullers.—Excelsior Pan; Wheeler & Randall's Pan; Excelsior Continuous Grinders.

12. Pans with Perpendicular Mullers.—The Centrifugal Ore Grinder; Varney's Qnartz Grinder.

III.—CONCENTRATION.

Concentration of Reduced Ore.—Division.

A. Concentration of Ore Grains (Jigging Stuff).—The Principle; The Jigging.

2. Movable Jiggers.—The Movable Jigger.

3. Stationary Jiggers. — Hydraulic Jigger; Petherick's Separator; Stationary Jigger.

4. Continual Jiggers. — Percussion Jigger, Setz Herd); Continnal Cylinder Jigger; Continnal Jigger; Hydraulic Coutinnal.

5. Rotary Machines.—The Rotating Cylinder (Strom-setz Maschine); Rotating Wheel (Setz-Rad); The Dolly Tub; Auferman's Dry Jigger.

B. Concentration of Ore Sands and Slimes.

6. Assorting of Sands.—The Labyrinth; Borlace's Slime Separator; Ph. Hofmann's Separator; Rittinger's Funnel or Pointed Box; Rittinger's Spitz-Lutte.

7. Feeding of Concentrator.—Feeding-Boxes; Stationary Feed-Box; Rotating Feeder.

8. Stationary Concentrators.—Hand Buddle; Sleeping Table; Rack; Sweeping Tables; Ronnd Buddle; Concave Bnddle; Blanket Tables.

9. Percussiou Tables. — Percnssion Tables; German Percnssion Table; Continnal Percussion Table; Hunter's Continnal Percussion Table; Varney's Percnssion Buddle.

10. Oscillating and Shaking Tables.—Borlace's Concentrator; Hendy's Concentrator; Hungerford's Concentrator; Barron's Concentrator.

11. Steady Moving Concentrators.—Concave Rotary Buddle; Convex Rotary Buddle; Burton's Table; Self-Discharging Blankets; Horizontal-Moving Blanket.

IV.—SPECIAL CONCENTRATION.

1. Concentration of Gold Ores.—Concentration of Gold Ores; Amalgam of Gold Quartz; Amalgamation and Griuding; Combined Concentration and Amalgamation; Treatment of Concentrated Stuff.

2. Concentration of Silver Ores; Concentration Works; Cost of Concentration; Concentration of Tailings.

3. Concentration of Lead and other Ores.—Concentration of Lead, Copper and other Ores; Value of Ores for Concentration.

V.—CHLORINATION.

Extraction of Gold from Sulphurets or Arsencials by Chlorination; Assay of Gold Snlphurets by Chlorinatiou; Chlorination Process for Sulphurets; Loss of Gold in Ronsting; Single Roasting Furnaces; Double Furnaces; Mechanical Furnaces; The Roasting Operation; Roasting with Salt.

Chlorination.—Damping of the Roasted Ore; Sifting; Production of Chlorine Gas; Lixiviation; The Precipitating Vat; The Precipitation; Cost of the Chlorination Process per ton of Ore; Remarks.

PRICE, - - - - - $7.50 per copy.

Sent by mail, and sold wholesale and retail, by DEWEY & CO., publishers, office MINING AND SCIENTIFIC PRESS, San Francisco.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heat more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co, Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT.

Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S. Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gauthier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

18v18-9p **519** Front street, San Fraacisco

New Mining Advertisements.

Hornet Silver Mining Company.—Location of Works: White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of July, 1869, an assessment of ten (10c.) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 419 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the eighth (8th) day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the thirtieth (30th) day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

M. S. MARTIN, Secretary.

Office, No. 11 Hayward's Building, 419 California street, San Francisco. jy31

Silver Sprout Mining Company.—Location of Works and Mines: Kearsarge District, Inyo county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-seventh day of July, 1869, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, 419 California street.

Any stock upon which said assessment shall remain unpaid on the thirty-first day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twentieth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINCARD, Secretary.

Office, 408 California street, San Francisco. jy31

Mining Notices--Continued.

Daniel Webster Silver Mining Company.—Location of Works: White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of June, 1869, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office.

Any stock upon which said assessment shall remain unpaid on the thirtieth (30th) day of July, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the nineteenth day of August, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.

Office, 418 California street, San Francisco, Cal. jy3

POSTPONEMENT.—The day for deeming stock delinquent on the above assessment is hereby postponed until Friday, the twenty-seventh day of August, 1869, and the sale thereof until Thursday, the sixteenth day of September, 1869. By order of the Board of Trustees.

jy31 O. D. SQUIRE, Secretary,

Cordillera Gold and Silver Mining Company.—Location of Works: Morelos District, Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of July, 1869, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 321 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the eighth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, No. 220 Clay street, San Francisco. jy10

The Mines and Mills About Treasure City.

[Written for the Mining and Scientific Press.]

EDITORS PRESS:—The regular summer showers, which occur about this time, have commenced, and we shall be regaled with their cooling influence for the coming month at least. They last but an hour or two each afternoon, and after laying the dust and clearing the atmosphere, we are treated to the most delightful sunsets on the American continent.

Messrs. Pierce and Walker, connected with the Chicago commercial party, are sojourning with us. They have visited a number of the principal mines, among them the Eberhardt, Aurora Consolidated, Chloride Flat, and the Iceberg, Nevada, Summit, Post Hole and Industry of the Treasnre Hill M. and M. Co. They express themselves thoroughly satisfied with the great wealth of the district, and have met the city and county officials and exchanged views with them. I expect they will both invest in our mines, and also secure considerable trade from our people.

Several new and rich discoveries have been made since my last, among them a large body of rich ore in the Pocotillo. The company started an open cut into the old body of ore, and iu the very bottom of this cut found the ledge going down, carrying a mass of exceedingly rich chloride with some horn silver. This ore will produce at least $300 per ton. The Buttercup, below Hamilton, has exposed a fine body of horn silver, worth upward of $1,000 per ton, and the Charter Oak, of the White Pine M. aud M. Co., has exposed a body of purple, or, properly speaking, pure chloride of silver.

New Discoveries.

We have now two outside excitements. The first is Mineral Hill District, situated between Argenta and Elko, in Pine Valley. This district is proviug extensive, and furnishes ore in large quautities, which will produce $500 per ton. I hope to have the particulars in a few days. The second was discovered last week, and is about twelve miles from the Hay Ranch Station, on the stage road to Austin. The discoverers brought in ore which assayed $10,000 per ton, and represent that the mountains are full of it. Over 100 men have gone out to examine into the matter, and to-morrow we shall know how much truth there may be in the statement. It is but fifty miles west of this place, and a short time will suffice to prove it.

New Mills.

The Metropolitan mill, after great trouble has succeeded in obtaining a supply of water from the Silver Springs Water Co., and will start up in a few days. The California Co. have nearly all of their machinery on the ground, and are sinking for water some 150 feet below the site of the mill. I should think men would learn that water must be had to make a mill a success; but they are building a mill much finer than most of the parlors on the coast, and should they fail in finding a larger supply of water than I think they will, it will be of but very little use for reduction purposes and a source of less income. The Treasure Hill mill has purchased the Hamilton spring, and now ruu their whole twenty stamps, wet crushing about forty tons per day. The Coover mill, also incorporated, as the Treasure Hill, has secured the services of T. McMasters, the best amalgamator in the State, and the first to successfully reduce the ores of this district by the process now generally used here. At the time the Manhattan lost several thousand dollars by guaranteeing eighty per cent. on the Eberhardt ore, McMasters was getting as high as ninety-two and ninety-three per cent. from the same ore at the Monte Cristo mill. Jeremiah Miller has taken the White Pine mill, lately leased by General Page, and will start it again on Monday for the benefit of his company.

The injunction laid by the Aurora Consolidated Co. on the Earl mine will be decided to-morrow by Judge Beatty, and no doubt this will decide a great many suits now pending.

The Pogonip & Othello is improving very fast, and bids fair to become the best mine in the district. They have several hundred tons of ore out that will produce a profit; their mine is well opened, and they could declare a dividend in thirty days if desirable.

Mount Ophir continues to improve; but as no quantity of ore has been worked from that portion of the district, I shall wait the proof. Yours, etc., G. B. E.

Treasuro City, Nev., July 18, 1869.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13vl0qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. O. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

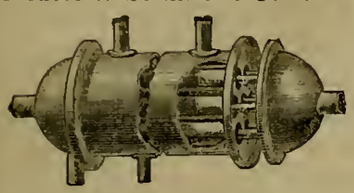
The pan being filled, the motion of the mutler forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 220 Fremont street,

1v1 San Francisco.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 6, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

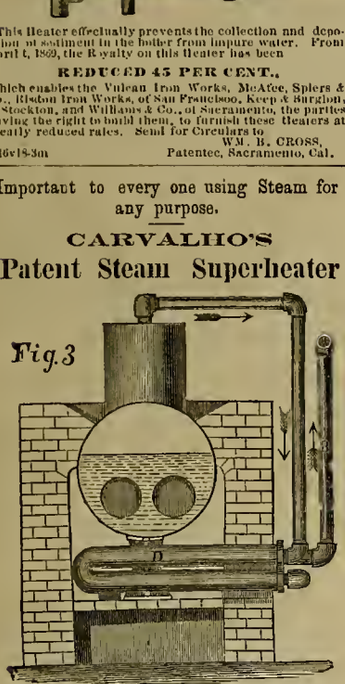
Important to every one using Steam for any purpose.

CARVALHO'S
Patent Steam Superheater

Fig. 3



[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1868.

"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after *seven* years of service.)

"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.

"Superheater saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.

"Superheater saves 20 per cent. of coal, less steam pressure, exhaust more serviceable in drying paper."

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.

"Superheater saves not less than 20 per cent. fuel; no priming!"

CRICKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.

"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y. DYEING & PRINTING ESTAB., Oct 4, 1867.

"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves fuel at least 15 per cent. fuel."

CONTINUOUS OIL REFINING CO., Binghampton, N. Y., Sept. 20, 1867.

"Superheaters give entire satisfaction, and we superheat to 55° deg—an increase of 20° deg."

CARBW MANUF. CO, So. Hadley Falls, Mass., Oct. 17, '67.

"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867.

"Superheater saves at least 25 per cent in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867.

"Superheater saves 25 to 30 per cent. in fuel; no priming"

CONTRA COSTA LAUNDRY, Oakland, July, 1868

"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAVILAH M. CO., Cal., August, 1868

"Superheater causes a use of 40 lbs. steam instead of 60 lbs.; use much less water, and there is a saving of fuel." (2 sets.)

SIXTH MECHANICS' INST. FAIR, S. F. Sept 4, 1868.

"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.

"Superheater is a perfect success, and saves three cords of wood in ten, or 33⅓ per cent. in fuel; engine works letter."

And many other letters of the same tenor.

Awarded Silver Medal, Mechanics' Institute, San Francisco, 1868.

Awarded Silver Medal, Maryland Institute, Baltimore.

Awarded Silver Medal, American Institute, New York, 1865.

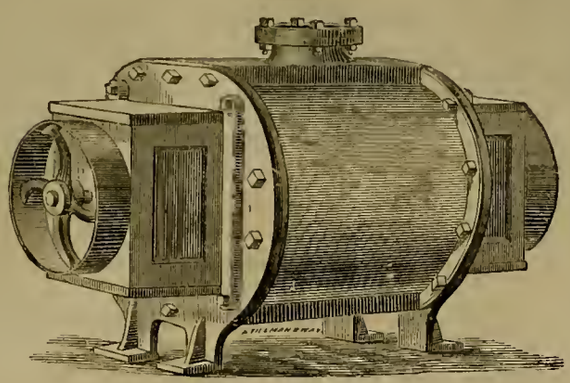
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

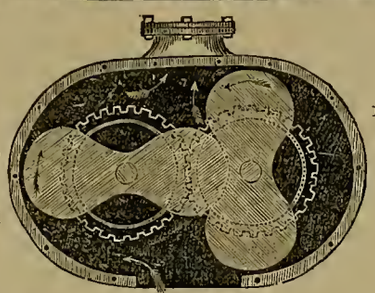
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 21, 1868; and Oct. 6, 1868.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

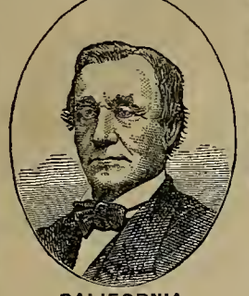
More than 100,000 Persons

BEAR TESTIMONY TO THE

Wonderful Curative Effects of

Dr. Joseph Walker's

"The Life of all Flesh is the Blood thereof."—Purify the Blood and the health of the whole system will follow.



CALIFORNIA

It is a gentle Purgative as well as a Tonic.

These Bitters are not a gilded pill, to delight the eye or please the fancy, but a medical preparation, composed of the best vegetable ingredients known.

VINEGAR BITTERS,

THE GREAT BLOOD PURIFIER.

Cleanse the vitiated blood whenever you find its impurities bursting through the skin in Pimples, Eruptions, or Sores; cleanse it when you find it obstructed or sluggish in the veins; cleanse it when it is foul, and your feelings will tell you when. Keep the blood healthy, and all will be well.

Dyspepsia or Indigestion.

Headache, Pain in the Shoulders, Coughs, Tightness of the Chest, Dizziness, Sour Eructations of the Stomach, Bad Taste in the Month, Bilious Attacks, Palpitation of the Heart, Inflammation of the Lungs, Copious Discharges of Urine, Pain in the Regions of the Kidneys, and a hundred other painful symptoms are the offspring of this Dyspepsia. For these troubles take Dr. Walker's Vinegar Bitters, and quickly all painful symptoms will disappear.

It is a Gentle Purgative as well as a Tonic,

Possessing, also, the peculiar merit of acting as a powerful agent in relieving Congestion or Inflammation of the Liver, and all the Visceral Organs. In this respect, these Bitters have no equal.

For Female Complaints,

Whether in the young or old, married or single, at the dawn of womanhood or the turn of life, these Tonic Bitters display so decided an influence that a marked improvement a soon perceptible in the health of the patient.

For Inflammatory and Chronic Rheumatism and Gout,

These Bitters have been most successful. They are caused by vitiated blood, which is generally produced by derangement of the digestive organs.

PIN, TAPE and other WORMS, lurking in the system of so many thousands on this Coast are effectually destroyed and removed.

Morbid Condition of the Blood.

This is the fruitful source of many diseases, such as Tetter or Salt Rheum, Ringworm Boils, Carbuncles, Sores, Ulcers, Pimples, and Eruptions of all kinds For the cure of these various affections, which are mere symptoms of a morbid condition of the blood, medical science and skill have not, as yet, discovered a Blood Purifier equal to Walker's Vinegar Bitters.

Diseases of the Blood, Liver, Kidneys, and Bladder.

It thoroughly eradicates every kind of humor and bad taint, and restores the entire system to a healthy condition. It is perfectly harmless, never producing the slightest injury.

Bilious Remittent and Intermittent Fevers,

Which are so prevalent in the Valleys of the Pacific Coast, especially those of the Sacramento, San Joaquin and their tributaries, during the Summer and Autumn, and especially during seasons of unusual heat and dryness, are invariably accompanied with extensive derangements of the stomach and liver, and other abdominal viscera. There are always more or less obstructions of the liver, a weakness and irritable state of the stomach, and great torpor of the bowels, being clogged up with vitiated accumulations. In their treatment, a purgative, exerting a powerful influence upon these various organs, is essentially necessary. There is no cathartic for this purpose equal to Dr. J. Walker's Vinegar Bitters, as they will speedily remove the dark-colored viscid matter with which the bowels are loaded, at the same time stimulating the secretions of the liver and restoring the healthy functions of the digestive organs generally. The universal popularity of this valuable remedy in regions subject to miasmatic influences, is sufficient evidence of its power as a remedy in such diseases.

For full directions read caretully the circular around each bottle.

For sale by all druggists and dealers.

Liberality of Physicians.

[From the Pacific Medical and Surgical Journal.]

It has always been said that physicians would disparage any remedy, however valuable, which they did not originate themselves. This has been disproved by their liberal course towards J. WALKER'S VINEGAR BITTERS, they well knowing them to be an invaluable preparation manufactured from the native herbs and roots heretofore known only to the Spaniards and Indians of California. Many of the profession, after having tested their virtues, have adopted them into general use in their practice, thereby showing a willingness, commendable on their part, to countenance articles that have intrinsic merit. This is highly creditable to the learned profession of California, and contradicts the prevalent notion of their opposition to remedies based on interest to discard them. We have always had confidence in the honorable motives of our medical men, and are glad to find it sustained by the liberal welcome they accord to Dr. J. WALKER'S INIMITABLE VINEGAR BITTERS, even though they are not ordered in the books, but are made known to the public through the newspapers, and other mediums of advertising.

Pure Blood and Pure Water.

Pure blood may be compared to pure water and impure blood to muddy water. If you pass muddy water through muslin, you soil it; continue the process, and you cover it with thick mud. Blood is the great circulating medium, passing through all parts of the body, and, if impure, it leaves its impurities behind, which breed sickness and death. Medical science has utterly failed hitherto to furnish a medical agent for renovating and purifying the blood equal to Dr. Joseph Walker's Vinegar Bitters. They are easy in their administration, prompt in their action, and certain in their result. Their peculiar vegetable properties penetrate at once to the seat of disease, and eradicate all impure or poisonous matter from the system. Climatic changes, which so materially affect the great majority of preparations, have no effect on this remedy. It is used successfully in all climates and countries, north and south alike, and has never been known to fail in a single instance when the directions have been followed. Let those afflicted with disease try one bottle of these Bitters and it will prove a better guarantee of their merits than all we or others can say in their favor. Thousands now pronounced incurable may be saved and their lives prolonged by the use of this valuable medicine. To those who seek health we would say, there is no man, woman or child, however wasted by disease, but what may be relieved or cured by these Bitters, if their system is in a condition to receive nourishment, and the Lungs, Liver and Kidneys and other vital organs, are not wasted beyond the process of repair.

None genuine unless signed

DR. JOSEPH WALKER'S

VINEGAR BITTERS.

SAN FRANCISCO, Cal., Jan., 1869.

Read the following Letter from Dr. J. Walker:

READER.—Do not cast this aside with a look of contempt. If you chance to be one of the lucky few who are never ailing, preserve this and hand it to your invalid friend, that he may know the means of becoming well, hearty and vigorous, and to live to die of old age.

Four years ago I was, what I thought, "a used up man," which was also the opinion of my friends and acquaintances.

I had the Consumption, Bronchitis, Palpitation of the Heart, Piles, and Rheumatism in my Hip. My leg became paralyzed, and my whole side partially so. I was then in California, and was given up by physicians as inerrable. I tried everything I thought would help me that I could find in the apothecary shops, but to no purpose. Die I thought I must.

One day I was near a camp of Indians, and found them gathering and picking herbs. I inquired what they used them for, and they told me. I then went to experiment on a compound which I perfected and commenced taking, and to my utter surprise, in three weeks was able to attend to my business, and after taking it eight months I felt better than I ever did in my life, and considered myself well. Many persons who knew my former condition were surprised when they saw how well and hearty I was, and came to me for the medicine for themselves and friends. In fact, with my small means of manufacturing, I could not supply the demand. I had to put them up in jugs, junk bottles and anything I could get, and found they produced such astonishing effects upon all diseases, that I thought it my duty to put them within the reach of all suffering humanity.

I moved to San Francisco, and commenced putting them up, calling them J. WALKER'S CALIFORNIA VINEGAR BITTERS.

I have disposed of hundreds of thousands of bottles, and, to my knowledge, not a single person who has taken them but it has helped or cured. On women the effect is magical, making the old fresh and vigorous, and giving to the young life and ambition.

Now I assert without fear of successful contradiction that there is no disease these Bitters will not cure. I know that there are hundreds that will doubt this, but to them I say, bring me the case, and if I do not cure them with my Bitters, I will forfeit $100, providing the lungs are not too far gone, or the bones not destroyed by minerals or other means. People may call me a humbug, and doctors may cry out against me, and well they may, for their occupation is gone.

In conclusion, to the afflicted let me say, give my Bitters trial; it is all I ask—they will speak for themselves.

Respectfully yours, JOSEPH WALKER.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y18p

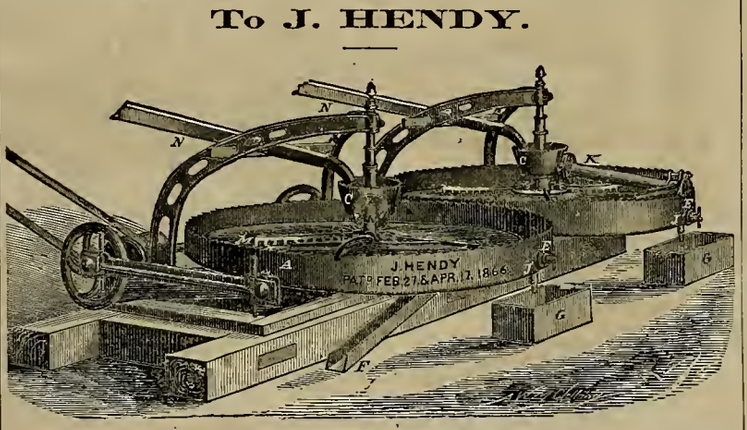
PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.



A LARGE NUMBER OF THESE
IMPROVED CONCENTRATORS
ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.

JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Minc.

Ernst's Rotary Roasting Furnace.

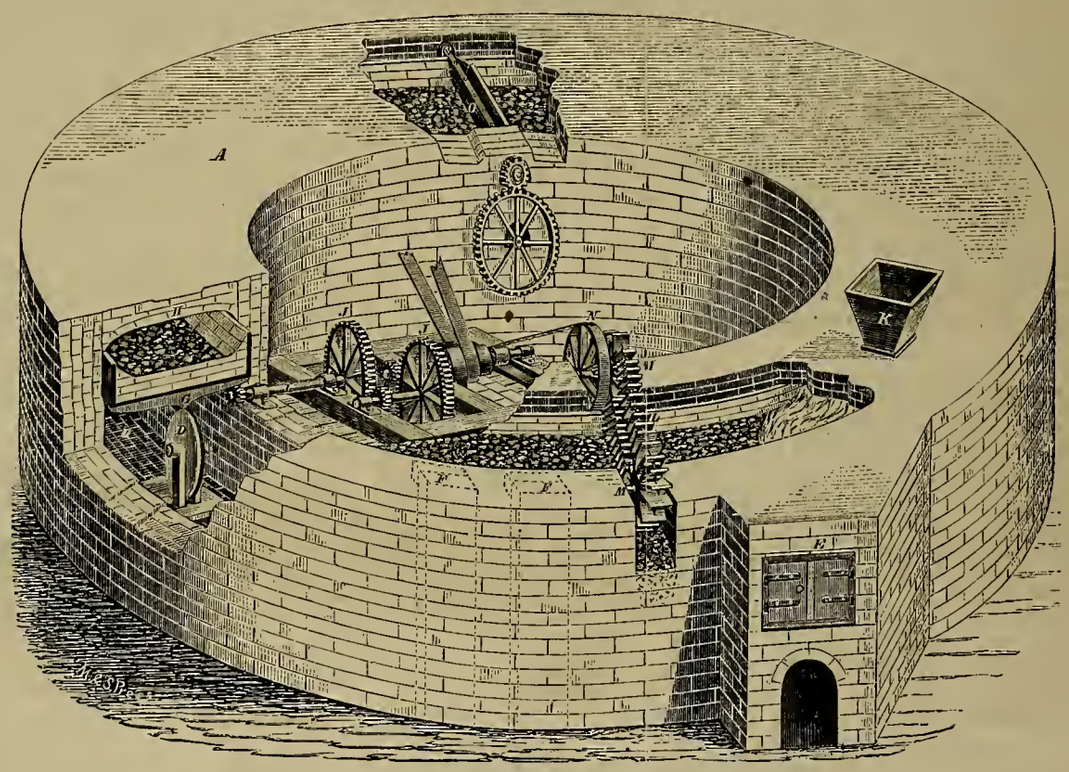
We herewith illustrate the form and working plan of Mr. F. Ernst's Roasting Furnace, patented some twelve months since through the Mining and Scientific Press Patent Agency.

This is a mechanical furnace, which does away entirely with manual labor, excepting a fireman. It charges, roasts, stirs, and discharges the ore by a very simple mechanical contrivance,—in fact, performs all the operation required in the oxidation or chlorination process of roasting gold or silver ores.

The following is a description of the accompanying engraving:

The ore is taken by means of an elevator from the battery, and is discharged constantly and regularly into the hopper, *K*, from whence it reaches the rotating hearth, *G*. This hearth consists of a cast iron orbicular ring paved or lined with bricks, and revolves on a series of iron rollers, *D*, and is kept continually in motion by means of the gearing, J. This gearing has two gear wheels, three feet in diameter, and pinions to regulate the speed from the cone pulley, increasing or diminishing it to conform to the required slow motion of the hearth, *G*. The hearth so charged and running constantly carries the ore into the first heat, which is next to the flues, and so passes all the different temperatures of the furnace, thus effecting a very uniform heating and chemical action on the ore; at the same time it has also to pass the stirrers, of which there are different kinds,—stationary and movable ones,—the number and speed of the latter varying according as the ore contains more or less sulphur. The movable paddle-stirrers are shown at *O*. These movable stirrers are connected with the gearing under the iron bed of the hearth, *G*, as shown at different points, till it passes the fire-bridge, where it receives its ultimate and highest heat, and is then discharged by the discharging apparatus. This discharging apparatus consists of two chain or rag wheels, *M*, *M*. These two chain-wheels drive a double endless chain with inserted plates of iron (scrapers). The chain hanging loose underneath between the wheels, draws these iron plates through the cavity of the hearth, and so discharges constantly the roasted ore.

To keep the current of air constant throughout the whole length of the furnace, the arch over the hearth decreases slightly from the fire-bridge towards the flues. For concentrated sulphurets it may be advantageous to increase the circumference of the hearth. The advantages claimed as attainable from the use of this machine are—the doing away with a large portion of the costly hand labor ordinarily required, and the better and more thorough accomplishment of the same by machinery. A great saving of fuel, not only through the length of the hearth, but also for the reason that all the gases which are lost by other furnaces, are economically employed in this as a substitute for other fuel.



ERNST'S ROTARY ROASTING FURNACE.

The furnace is so constructed that the large access of air required for the oxidation of the ore, in addition to that demanded for the consumption of these gases, does not operate to materially lower the temperature in the furnace. When the ore in this furnace is once desulphurized, the gases cannot form any new combinations with the ores or metals therein, for the reason that while the currents of air and gases are moving to the rear, the furnace hearth is constantly advancing in an opposite direction.

The construction of this furnace is of the simplest kind, and all the necessary castings can be easily transported even on mule-back. The loss of the silver by sublimation in present furnaces, it is claimed, is avoided in this, as the silver condenses before reaching the flues; the distance being great, and the heat diminishing gradually until the gases reach the point of final exit.

We consider this new furnace well worthy the attention of metallurgists and mine holders. Mr. Ernst is an experienced operator in the reduction of ores, and his efforts for years have been directed to improvements for the economical and perfect treatment of gold and silver ores.

Liberal terms are offered by the patentee to parties who desire to use his improvements. Further information can be had by addressing F. Ernst, San Antonia, Lower California, Mexico; or by calling upon H. W. Schmidt, Druggist, Kearny street, corner of Sacramento, San Francisco—or at this office.

Earthquakes.—Late dates from Lima speak of the publication in the South American journals of a prophesy by a German *savant* by the name of Falk, to the effect that a series of earthquakes is about to take place in Ecuador, Peru, and Chili. They will commence on the 10th of August; and be followed up on the 10th of September, or October, by a shock more violent than any yet recorded. It is said that many families are preparing to leave the country for the season. A Valparaiso paper, in alluding to the same prognostication, says that several shocks of earthquake have already been felt.

The Oxy-hydrogen Light.—The *Gas-Light Journal* thinks the new light will not be a success. It is not sufficiently simple in its mechanical arrangements to be manageable by servants and children. The expense of introducing it will be great; inasmuch as it requires *two* pipes,—one for the oxygen and another for the hydrogen or coal gas. The pressure required being five or six times greater than in the ordinary street mains, a supplementary gas-holder would be required to each building. The high pressure would involve great loss by leakage. This leakage would involve a liability to explosion, caused by gas escaping into basements and rooms not well ventilated. The increase of oxygen in an apartment to the amount of one-tenth the total volume, would cause a spark to burst into flame. A cigar stump not extinguished, for instance, might cause a conflagration.

Again:—The light is *harsh*, not *mellow*. It must be toned down by means of semi-transparent media as, for instance, ground glass. This reduces its photometric power; and a test of its value as compared with other lights should be made upon it in this condition. The jets of gas require such delicate proportionate adjustment that the light is sometimes intractable, and will suddenly go out even in the hands of an expert.

Still another Atlantic Cable is talked of to connect this continent with the town of Milford in Wales.

Familiar Science.

Shoddy in Glass.

There is "shoddy" in glass as well as in woolen fabrics. Consumers of kerosene are oftentimes almost discouraged at the freqnent breakage of lamp chimneys, without any apparent canse. Cheapness being the order of the day, many manufactnrers make chimneys from a silicate of lime instead of a silicate of lead; simply because such glass is very much cheaper than the genuine article. Moreover, it is much more liable to hreak—thus adding both to the profit and the business of the mannfactnrer. The initiated can readily tell the different kinds of glass either by ringing or weighing them. The vibrations of the lead glass have a clear, ringing, bell-like sound, possessing the requisite strength and elasticity to withstand expansion and contraction, as well as the general pressure of use. Chimneys made of such glass will ontlast half a dozen of the silicate of lime or lime-glass chimneys. A few cents extra invested in a lead-glass chimney is money well spent, to say nothing of the saving in wear and tear of temper. It may injure the "trade" in the "shoddy" estimation, as it should do.

Lime-glass costs, in the pot, only about tbree cents per pound, while good lead-glass costs about ten cents. There are about four chimneys to the pound, so that the margin for gain in "shoddy" is quite large. Glass for chimneys should contaiu from thirty to thirty-five per cent. of lead; the best cut glass contains about fifty per cent. An excess of lead is employed in glass which is to he "cnt," so that it may yield more readily to the cutting wheel.

There is a new glass now heing introdnced into the market which does not contain any lead; but which is about midway in value and wearing qualities between lime and lead glass. The improvement is in the mixing. It was first discovered by a Pennsylvania glass-maker, who kept his secret as long as he could; but the prying eyes of the chemist have finally detected it, and the "new glass" is now made at most of the manufactories in the Atlantic States.

Night Air—Erroneous Impressions.—An extraordinary fallacy is the dread of night air which troubles so many people. What air can we breathe at night hut night air? The choice is between ipnre nigbt air from without and foul air from within. Most people prefer the latter. An unaccountahle choice. What will they say if it is proved to be trne that fnlly one-half of all the disease we suffer from is occasioned by people sleeping with their windows shnt? An open window, most nights in the year, can never hurt any one. In great cities, night air is often the purest and best to he had in the twenty-fonr honrs. I could better understand shuttiug the windows in town during the day than during the night, for the sake of the sick. The absence of smoke, the quiet, all tend to make night the best time for airing the patient.

One of our highest medical anthorities on consumption and climate, has told me that the air in London is never so good as after ten o'clock at night. Always air yonr room, then, from the outside air, if possible. Windows are made to open, doors are made to shnt—a truth which seems extremely difficult of apprehension. Every room must be aired from without—every passage from within. But the fewer passages there are in a hospitals, the hetter.—*Florence Nightingale.*

To Ontain Pure Copper in Powder.—Add to a satnrated solntion of sulphate of copper, an eqnal volume of hydrochlorio acid, and insert in the mixturc, several thiu strips of zinc; hydrogen gas is evolved, and a porons copper remains, which when washed and dried is pure metallic oopper, free from oxide. This is a portion of the method preferably adopted in the assay of copper ores. Copper in powder may also be ohtained by transmitting a stream of coal gas throngh a mass of hlack oxide of copper when heated in a flask. This may he done by means of two tubes perforating the cork.

How Broken Bones Heal.

An eminent physician writes as follows in the *Hearth and Home:* Broken bones heal like wonnds of the flesh, hut very slowly; the former require months where the latter require days. The first effort of nature is to clear away the rubbish, or injnred tissne, the same as the mason would remove the *debris* of a hroken wall before attempting to repair the breach. This preliminary work requires five or six days, or even more time, if the injury is severe. During that period the surgeon can do nothing bnt look on with folded hands. The limb in the mean time, should be placed in an easy position, kept perfectly quiet, and cooling applications made to prevent undue inflammation. All efforts to set the bone, during that period, are not only useless, but frequently very injurious. Still greater violence is done to the fractured bone by such efforts, and the dressings necessary to retain the bones in apposition. At the end of about a week the inflammation has somewhat subsided, the limb can be handled without great pain, and the work of repair is now to commence. At this time the hones are to be gently put in their proper relations, and proper retaining dressings applied. This is the true setting of the bones, and can be accomplished without pain or inconvenience, by a skillful surgeon. From this time, all that is required to perfect the cure is to maintain the bones in a state of perfect rest. When a bone is hroken there is no need of haste and impatience. Simply place tbe limb on a pillow, in an easy position, and apply clotbs wet with cold water, arnica, or any form of diluted spirits, and you will have done about all that the best surgeon can do for a week at least.

The Manufacture of Corn Starch.—Methods for the preparation of this popular food vary somewhat with manufactnrers, hut the following method is perhaps as good as any. By this method tbe grain is first steeped either in alkaline water, or in water only, until the grain is thoronghly soaked. It is then reduced to pulp by the use of rollers, or suitahle machinery. It is next passed over a sieve through which the finer portions are forced by revolving brushes, while the coarser parts remaining are to be regronnd. The husk or bran is now separated, and may be used as food for cattle. A stream of water runs constantly down upon the sieve and carries the portion passing through, over an inclined plane or "run." The plane is divided into sections by wooden cleats which are laid across it. These cleats or dams intercept the starch which settles to the bottom, from which it is removed at proper intervals. The greater part of the glutinous and fibrous portions are carried along by the current, and are thus separated from the starch. The starch can be still further purified from the glutinous and fibrous matters by treating it with an alkaline solntion which dissolves the gluten, running through finer sieves, and rewashing it on the inclined plane.

A Cure for Low Spirits.—Exercise for the body, occupation for the mind, are the grand constituents of health and happiness. Motion is a great preserving principle of nature, to which even inanimate things are subject; for the winds, waves, and the earth itself, are restless; and the waving of trees, shrubs and flowers is known to be an essential part of their economy. A fixed rule of taking several hours' exercise every day, if possible, in the open air, if not, under cover, will be almost certain to secure one exemption from disease, as well as from attacks of low spirits, *ennui.* Low spirits cannot exist in an atmosphere of bodily and mental activity.

How to Treat Sun-Stroke.—Strip off the clothing from the head, neok, and chest, and spray the patient on these parts of the body gently, but thoroughly, with cold water; at the same time place the feet in water as bot as it can be borne. Meanwhile, let a strong healthy person rnb gently the legs, and back, and abdomen, having the hands kept cool by occasionally moistening them in cold water. Let the patieut when he is able, drink a little cold water, and after he is able to sit up, have his head packed in oloths kept constantly cool by wetting them in water. As soon as practicable, move the bowels with tepid injections of water. In almost all cases of sun-stroke, the bowels are obstructed with offensive matter whicb must he removed. This treatment can he effectually administered hy any skillful, sympathetic person, who knows when to stop.—*Herald of Health.*

Hard Times vs. Mining.

[Written for the Mining and Scientific Press.]

Messrs. Editors.—On every side we hear the cry of hard times, bnt if we look sqnarely at the condition of affairs, we cannot figure any other result from such causes.

The very pursnit which has previously insured a certain revenue to the public for business pnrposes, is becoming more and more discarded, and for what? Nothing, I answer, which equalizes the loss from this source. To read the daily journals on "onr industrial resources," one would suppose we were a great mannfactnring and producing people. What do we raise or mannfactnre that amonnts to any moment when taken in connection with onr imports for which onr gold must pay the deficiency? Even what we do do is done by a class of people who are small consumers and clanish hoarders,—what is paid to them is of but little public benefit. With all our puffed-up ideas of the "great metropolis" and "great California," we have imported thirty millions to about eight millions of exports, *outside of gold*—in the past six months—to July 1st. Is this kind of business to huild us up, without mining, which has yielded ahout fifty millions per annum? Mining is all that has saved the country. Can our bankers and business men afford to decry it? Are they not cutting off their own resources by so doing? It seems to me so.

The fact is, mining *must* be encouraged and supported, or we are a bankrupt people, at all events until we can reverse the import and export figures.

If it has proved detrimental to many, correct the troubles, which will prove to be more in a lack of attention to *legitimate* mining, and more attention to reckless speculation.

The question, as I look npon it, viewing "hard times" from the little end of the horn, is clearly presented by figures that we have got to *mind*, or "bust." '49.

Notes of Travel.

We 'condense the following from some "Notes of Travel" furnished us by an attentive correspondent:

Suisun.—We have met and enjoyed the hospitality of our friend Mr. Oliver Denny. Mr. D. is an artist of no inconsiderable merit, and the "special" of the California Pacific Railroad Company, along the line of which he has taken a large number of veiws, several of which are forwarded herewith. The business prospects of Suisun are rapidly improving.

Grain Yield.—The crops along the line of the railroad in Solano county, and the southern part of Yolo, through which it passes, are turning out even better than expected. The day I passed over the road there were 6,000 tons of grain at Dixon's Station, 6,000 at Dakes', and at intermediate points, including Davisville, the estimate was 13,000 tons—making the total amount sacked and lying along the road ready for transportation, not less than 25,000 tons, and the farmers are still in the midst of their harvest, with thousands of tons yet to be cleaned and sacked. The farmers all through this section appear to be jubilant over their prospects.

Sacramento and its Female Seminary. We were bere welcomed to all the comforts of a palace home by that worthy gentleman, Prof. Herman Perry, principal of the Sacramento Female Seminary. This institution, which was established in 1863, has met with a most remarkable degree of prosperity. It is under the direct management of Prof. Perry and his estimable lady, who are aided by a competent corps of assistants. The building is an elegant brick edifice, three stories high, exclusive of basement. The grounds are ample, tastefully laid out, and adorned with a profusion of flowers and shrubbery.

Bnsiness of all kinds is quite brisk here, more so in fact than any place I have visited. The foundries and machine shops are all running full-handed; shipping merchants look gay and happy, and every department of industry is looking up. The various transportation lines are coming and going full to overflow. L. D. C.

Strength of the Spider's Web.—A bar of irou one inch in diameter will support a weight of twenty-eight tons; a bar of spider's silk of the same diameter would snpport a weight of seventy-four tons.

California Academy of Sciences.

At the regnlar meeting of the Society on Monday evening, Aug. 3d, seventeen members were present—Dr. Blake in the chair. Mr. Gale presented a specimen of the star fish to compare with another specimen which had been injured. The same gentleman also presented several specimens of fossil shells from Treasure Hill, White Pine.

Mr. Mnrray, of Hnmboldt Connty, presented an Indian instrument made of serpentine, taken from a gravel bed in Klamath Connty; also several stone relics found on the coast in Klamath County.

Dr. Gibbons presented some apples from Alameda Connty, of the growth of 1868, which had lain ont doors exposed to the weather beneath the oak trees since last November, a period of nine months, perfectly preserved. Specimen sheets of Mr. Elliot's work on Birds of North America, not hitherto described, one hundred and seventeen in number, were presented to the Academy. A general discussion followed, during which a member stated that the stone implements found in the mounds and old burial places of the Indians furnished no evidence of great antiquity, either of themselves or the persons who had fashioned them, as the same character of implements were in use at this day among the tribes of Indians who inhabit the country ahout Pnget Sound and east of the Sierra Nevada. Dr. Gibbons stated, as an evidence that the monnd builders had no knowledge of metallurgy or the combination of metals, there never yet had been taken from the mounds of North America an implement of any kind composed of any material except iron or stone. He said there had been found in some of the mounds of the Soutbern Pacific coast, articles of jewelry composed of virgin copper, covered with thin sheets of silver, but no specimens of bronze or other combination. The Chairman announced that the Society was now out of debt for the first time since its organization, and that they would now be enabled to reorganize, and improve their mnseum. After some further discnssion, the Society adjourned.

New Method of Refining Vegetable Oils.—"Mr. C. Michaud, of Honfleur, has discovered a new method of refining oil which will probably eclipse all those in general use at the present day. This method has just been communicated by M. Chevallier to the *Societe d' Encouragement.*

While sulphuric acid is introduced into the oil in minute nnmerous streamlets, air is blown into the oil so as to produce a great commotion in the liquid and to fill it with air bubbles. The mucilage contained in the crnde oil being acted on by the acid, soon forms with the air a voluminons layer of scum at the surface, whicb is skimmed off as it forms. This insufflation of air is repeated several times in succession, and the scums cleared off every time until the oil is clarified.

At this point of the operation it still retains free sulphnric acid. It is now run into a copper vessel, and steam is forced through it until the oil has reached a temperature of 100° Cent. The steam is then allowed to bubble through for half an hour or an honr longer. After the oil has cooled down some 20° or 30° Cent., which may be done artificially, it is run through an ordinary filter.

The oil obtained by this process surpasses in quality and in limpidity any that has been made to this day, and the operation combines the great advantages of speed and economy. Two large refineries have lately been pnt up on the Michand plan, and the oil produced by them is so pure that the wick of a lamp burning it will not carbonize after many days' nsage." *Scientific American.*

The Wire Tramway.—We have already noticed the method of transportation recently adopted for conveying stone from the Leicestershire (Eng.) stone qnarries to the railway statiou three miles distant. Boxes which will carry one cwt. of stone are hung at intervals on an endless wire rope, which is moved by steam at the rate of six miles an hour. The frame of the box is so curved that while its equilibrium is preserved, it passes through the supports without difficulty. It is said that the success of the plan is so complete that some of the leading engineers are discnssing the possibility of constructing a tramway of this kind between Dover and Calais, which should be supported from a line of pillars in the channel, and along which passengers could he carried.

Mechanical Progress.

Improvement in Rolling Iron.—An English roll turner has invented new rolls, which,—says the *Coal and Iron Review*,—possess many advantages over those heretofore in use. They are made in tubular form instead of, as now, solid; and a stream of water which is made to pass through them, prevents too great expansion from the heat and saves the "drag" upon the engine, which is so great under the ordinary plan, that the journals suffer wear to an alarming extent. With these rolls it is no longer necessary to apply water upon the outside during the operation of rolling. Not only therefore is the steam which has been a hindrance to the workmen entirely avoided, but the scales which stuck to the rolls, also; consequently the rolled iron is left with a smoother surface.

Shifting the Adjustable-gauge Cars. We have noted the fact that freight cars loaded with wheat were run over the whole distance between Chicago and Boston, their gauge being shifted to conform to that of the rails on the different roads. This shifting is done at Point St. Charles,—and in this wise: A pit, about four feet deep, has been excavated between the rails, in which the workmen, with hammer and wrench, takes his position. The track at the western end of the building is of the broad gauge, but gradually diminishes to the narrow gauge at the eastern entrance. Each wheel on the right side of the car, instead of being immovably fixed on the axle, by the unscrewing of a nut and loosening of a bolt, may be moved in upon the axle. It is but the work of a moment for the mechanic in the pit beneath the car to unscrew the nuts, and then the train, being slowly backed by the engine, the right hand wheels of each car are gradually crowded in by converging rails till they are brought to the narrow gauge. A few turns of the wrench and the wheel is firmly fastened and the car ready to move on to Boston. In changing from the narrow to the broad gauge a third rail crowds the wheel outward to the desired width.

Steam Lead a Fallacy.—F. W. Bacon writes the *Scientific American* upon this subject. He says that a properly-constructed engine does not require it, and that it causes great waste of fuel. The object is to arrest the momentum of the reciprocating parts of the engine, and prevent shocks when their motion is reversed. He says: "We substitute a cushion by closing the exhaust sufficiently early to fill the passage ways and clearance with the exhaust steam, by compressing it to, or nearly to, the initial pressure in the cylinder at the commencement of the return stroke. By this cushioning we gradually arrest the momentum of the reciprocating parts and store it for the return stroke. We do more: we fill the space between the closed steam valve and the piston with the exhaust steam, and consequently do not have to call on the boiler for it. We do more still: the piston, instead of meeting near the termination of the stroke a force equal to the initial pressure, *plus* its momentum, suddenly, like the impact of a battering ram, meets the thin vapor and compresses it gradually without a shock; thereby saving oil, heating, pounding, wearing of brasses, breaking of cranks, connections, and all their concomitant evils."

Rivets.—"The holes should never have sharp edges, and the head of a rivet ought to be connected with the shaft by a conical part. Whenever this part is omitted, and when, consequently, the rivets have sharp corners below their heads and the rivet-holes sharp edges, the rivets break close to the head, when subjected to a strain of tension and when the heads are strong enough not to be stripped off. When, on the contrary, the rivets have a conical connecting part between their heads and shafts, they extend considerably before they break, and the rupture finally occurs in the middle of the shafts. All experiments have given this result without exception."—*M. Balcke—Van Nostrand.*

The Siemens-Martin Process.—This process for steel-making has been abandoned—at least for the present. A correspondent of *The Engineer*, however, says that it is not, as yet, finally and definitely given up.

Coating Iron with Brass.—A new process has been patented in England, for coating iron with copper, brass, or silver, which *The Engineer* says bids fair to create a revolution in some of the trades. "Vencering" and electro-plating are both open to objection. "What has long been wanted is a method of coating iron with brass or silver, as readily as it is now coated with tin, and so as to render it equally durable. This has been at length successfully accomplished by a Wolverhampton patentee with remarkable success. The process adopted is that of immersion, but the details of the invention are for the present kept secret. I have seen, says the correspondent of *The Engineer*, some sheets of iron which have been coated with copper on this principle, quite equal, for all practical purposes, to sheets of copper. They will bear stamping into all imaginable shapes, and even burnishing, without removing the copper coat, the latter having to all appearance eaten its way into the inferior metal. Coated iron on this principle will supersede brass and copper to an enormous extent, for while it will be equally serviceable, it will be 40 per cent. lower in price."

Cutting Glass with Steel.—The *Scientific American* describes and illustrates a recently patented instrument for cutting glass, in which a hard steel cylindrical point does the duty of the ordinary diamond, and with, it is said, even greater rapidity. The cutting edge is the terminal edge of the small cylinder or point. This is made to *rotate* upon the glass, and rests upon two small disks, which serve as friction wheels; its other end having a pointed bearing which runs in an adjustable center. The instrument is held upon the glass at the angle of 45°, and is drawn towards the operator. For cutting circular plates, as for instance clock glasses, it is said to be superior to the diamond.

High and Low Steam Economy.—The following are the conclusions reached in two recent articles upon this subject in the *American Artisan:*

In a high-pressure engine, without expansion or condensation, theoretically 6·37 *per cent. of the heat from the fuel is utilized and* 93·63 *wasted; and in practice only* 5·10 *per cent.* is utilized, while 94.90 is wasted.

In a low-pressure condensing engine 7·02 *per cent. of the heat is utilized theoretically, and* 92·98 *is wasted.* In practice 5·27 per cent. is utilized, and 94.73 wasted.

In a high-pressure expansion engine without condensation 10·4 per cent. of the fuel is utilized, *and* 89·6 *is wasted*, theoretically; and 7·8 per cent. is utilized in ordinary practice.

In an expansion and condensing one-cylinder engine 15·9 *per cent. of the heat is utilized, and* 84·1 *per cent. theoretically wasted;* and practically in our best engines 11·92 only is utilized, and 88·08 is wasted.

Equivalent Horse-powers in Different Countries.—In the United States, as in England, we have 33,000 units per minute, the unit being the foot-pound. This corresponds with 550 units per second. In France, it is 75 units per second, the unit being the kilogrammeter (one kilogram one meter high). In Prussia, by reason of recent experiments, a unit has been adopted of 480 units per second for Prussian feet and pounds, or 28,800 per minute. In Austria, it has been settled that, in the future, 430 foot-pounds must be accepted as a horse-power. Besides this, Prussia has adopted a railroad standard—namely, a load of 250 centners, German weight, moved on a horizontal track with a velocity of one mile per hour, or 65 centners four miles per hour.—*Eng. and Min. Journal.*

New Blast Engine.—The *American Exchange and Review* thus describes a blast-furnace engine recently built at Norwalk, Conn.: "It is a vertical engine. The air-cylinder is 72 in. diameter and 8-feet stroke; the steam cylinder 36 in. diameter. The air piston and follower instead of being cast iron and having packing between, consist of a ring six inches in thickness, with space for packing, which will be of solid wood felted and set out by a spring ring. Instead of the one piston-rod taking the piston in the center, there will be three taking hold of the outside of the air piston, passing up through the head *outside of the steam cylinder*, and fastened to the crosshead."

Cleaning Water Gauges.—The glass tubes of water-gauges should be cleaned with acids or alkalies,—and not by friction, even with a soft substance. The least scratch on the inner surface causes it to crack.

Scientific Progress.

The Faraday Lectures.

On June 17th the inaugural address which commenced the Faraday lectures was delivered at the Royal Institution by M. Dumas, the Faraday of France. Prof. Williamson, F. R. S., occupied the chair, and after explaining the nature and object of the lectures, presented M. Dumas, on behalf of the Chemical Society, with a large gold medal, which he stated had been specially struck in commemoration of the visit of that gentleman to England.

The address of M. Dumas, which followed, is reported as having been eloquent and brilliant. The subject was "The Progress of Discovery in Chemical Science." In the course of the address, he referred to the researches of Dr. Dalton and Dr. Prout, and to the views entertained as to the atomic numbers being exact multiples of a standard number, urging that all elements were but varied combinations of some primary element with which as yet we are unacquainted. The remarkable nature of the progression of the numbers representing the atomic weights of elements of the same class was, he was convinced, not the result of mere accident. There was lithium, with its number 7; sodium, 23; and potassium, 39—each progressing by the number 16. Then, again, there was magnesium, 12; calcium, 20; and iron, 28—each progressing by the number 8, or the half of 16, which was certainly a most remarkable fact, and tended, in connection with our other knowledge, to show how much we have still to learn.

The immense field for investigation in the study of the effects of light and heat upon organisms, with the cause of those effects, was duly pointed out.

At the conclusion of the address, Prof. Tyndall, who was an old student of M. Dumas, moved the cordial vote of thanks of the Chemical Society to him; and remarked that his vigor and eloquence now surpassed the same of twenty-five years ago.

Prof. Wurtz on "Hydrogenium."

In a recent number of the *Gas-Light Journal*, Prof. Wurtz, after describing some experiments by which Favre believes himself to have confirmed the conclusions of Prof. Graham in regard to the metallic nature of hydrogen, makes the following remarks: "Though the possibility, even the probability, of a *metalloid* form of hydrogen (as there is one of carbon) is undeniable, yet this ancient theory of the metallic nature of hydrogen appears to me, notwithstanding Graham's brilliant discoveries, to rest as yet rather upon poetical than inductive ground. At least it may be distinctly asserted that there is nearly as much evidence that both oxygen and nitrogen are also metals. Fused silver absorbs oxygen, without change of metallic characters, and the "ammonium-amalgam" contains nitrogen as well as hydrogen. Many of the metallic oxides are metalloid in aspect, magnetic, electric conductors, etc.; and nitrogen forms metalloid nitrurets. The elements of the nitrogen group are metallic, except phosphorus, which is asserted to have been obtained also in a metalloid form. * * * An inductive view of all the facts seems to tend towards the conclusion that, both in this and in the corresponding carbonic oxide compound, the palladium is in a state analogous to that of gold or silver penetrated by liquid quicksilver, pointing to a liquid condition of the condensed gas. * * * I would ask what case is known of an alloy of solid metals formed by voltaic precipitation of one on the other? Amalgams, however, are readily thus formed, even of metals hard to amalgamate otherwise. Above all I would ask, is it conceivable that any alloy of solid metals once formed, could ever be *decomposed* throughout its mass, like the palladium compound, by being made the positive electrode in an electrolyte? It is, however, not at all inconceivable that an amalgam might thus behave. Against this may be argued the general destruction of tenacity by mercury; but this is far from invariable, as several metals (among them lead) can be combined with considerable mercury without destruction of malleability or tenacity.

I have hinted above at the possibility of a special metalloid form of hydrogen. In fact, Graham concludes that the hydrogen in the palladium compound is in the *active* form, corresponding to active oxygen (ozone. *Is ozone then metalloid?)* Does it not follow that if this active hydrogen is metallic, ordinary hydrogen is not so? Finally, I would inquire whether it has heretofore been taken into this consideration, what we are to make of the combinations of *carbonic oxide* with palladium and iron. Are we to create another hypothetical *compound* metal, *carbonylium*, and is steel possibly an alloy of carbonylium? Further speculation in this direction, however, we shall for the present hand over to the next lunatic asylum, and wait until some master-hand, by crucial experiment shall rend the veil, and let light into the labyrinth in which we now so blindly grope.

Ancient Human Remains.—It is said that the French government has sent a paleontologist to examine and report upon some human skeletons recently exhumed in the Department de la Dordogne. He reports that there are five; and that they must have belonged to a gigantic race, whose limbs resembled those of the gorilla. The skulls, however, are of remarkable size. They are in the hands of the scientists for careful examination.

Since the above was in type we have seen *Silliman's Journal* for July, in which we find a notice of *Reliquiæ Aquitanicæ*, containing an account of the researches of M. Lartet. We condense a few paragraphs from the remarks of the editor, Professor Jones: "No discovery could be of greater interest to Anthropologists than that of these bones. The objects found in the Caves of Périgord not only furnished us with the most satisfactory proofs of the contemporaneity of Man and the Mammoth, but they revealed the most curious details of the life and manners of the old Cave-dwellers of Périgord; still we were without any knowledge of the anatomical characters of this intelligent and artistic race, whose clever carvings are objects of our astonishment.

"The excavations lately made near Les Eyzies, by M. Louis Lartet, enable us to supply this want; and there cannot be any doubt of the authenticity and high antiquity of the human bones there exhumed."

Silver Stains Removed.—Everybody knows how persistent is the black stain of nitrate of silver. Cyanide of potassium, in solution, is often used to remove these stains; but there are objections to it. Grimm says the stains can be bleached by chloride of copper, and then washed out with solution of hypo-sulphite of soda and afterwards with water. For white stuff, a weak, freshly-prepared mixture of permanganate of potash and hydrochloric acid is used instead of the chloride of copper.

Leaves and Carbonic Acid.—Boussingault demonstrated the fact that carbonic acid is decomposed and oxygen produced, by the leaves of plants, in the following manner: He introduced a stick of phosphorus into a mixture of carbonic acid gas and hydrogen. No oxygen being present, the phosphorus did not undergo combustion; that fact being proved by the absence of vapors. But a green leaf then introduced, immediately caused the vapors to rise; showing that combustion was going on, and therefore oxygen had been produced by the decomposition of the carbonic acid.

Test for Blood.—The London *Lancet* says that Prof. Bloxam of King's College has found that a mixture of tincture of guaiacum and ozonized ether (that is to say, a solution of peroxide of hydrogen in ether) instantly produces with blood or blood-stains a beautiful blue tint. Prof. Bloxam mentioned that he had extracted a single linen fiber in the case of a blood-stain twenty years old, and with an almost inappreciable amount of stain on it; and had found the characteristic blue color was immediately induced by the test, and readily detected by microscopical examination.

Farming and Gardening.

The Silk Business.

Notwithstanding several mishaps to the worms in various portions of the State, where large losses have occurred, through inexperience or negligence, silk-growers are not at all discouraged or any the less hopeful for the future. Such mishaps must necessarily he expected in all new undertakings. The severe loss experienced by Mr. Haynie, whose worms were destroyed hy the fumes of pyroligneous acid, will not he likely to he again encountered hy him or any other grower who has heard of his accidental loss. All will profit hy his experience. Some losses have heen met with hy allowing too great a variation in temperature. In some instances it has heen allowed to fall too low; in others, through lack of ventiletion, it has been suffered to reach too high a degree. In the cocooneries of France and Italy, the temperature is very carefully watched while the worms are feeding, and kept within a range of from 66° to 80° Fahrenheit. One great difficulty is the unfitness of the huildings which have been used for cocooneries. To meet with success, on any very lerge ecale, huildinge ehould be put up with especial reference to the husinees. Where temporary and unsuitable structurcs are employed, accidents must be expected. Experimenters appear to be aware of this fact, and are in no way discouraged at unfavorahle results, in eo me instances.

Experience is also needed as to the proper time for hatching. This process must be euited to the climate of every given locality. Experience in Nevada county, where the summer is extremely hot, shows that July, or even the lest of June, is too lete. The experience gained in this particular during the past and previous year, will be carefully treasured np. In a country like Celifornia, where the climate is so varied, each locelity muet have its own times and seesons. Experience is the best teecher, and small experiments entail less loss and less liability to discouregement than larger ones. Amateur sericulturists will do well to keep careful records and compere notes.

Messrs. Michel and Loutzenheizer, of Grass Valley, and Mr. Muller, of Nevade City, have heen experimenting lergely the past season in Nevada county. The latter has had the largest experience, and, in conseqnence, appears to have met with the most complete succese and less loss. Mr. Loutzenheieer, especially, is not a man to give up an experiment becanse of partial failure. He has too long heen accustomed to making things snceeed, to ellow any failure in this, his latest undertaking.

It mey be interesting to eome of onr readers to know that the eilkworm *can* live on something else than *morus multicaulis*. A lady in Uteh Territory, the past season, fed 2,000 worms on Osage orange leaves for two weeks after hatching. Not one wae lost. The worm is also fed upon the ailanthns.

It is said that there is a Japanese worm, the Bombyx Yamamai, which ie carefully guarded and allowed to epin only for the Tycoon and his household, which feeds on oak leaves, and producee a very superior silk. A Frenchman hae recently eucceeded in smuggling away a few of the eggs of this species to the French garden of Acclimation, in Paris, from wheuce it is being distributed throughout Europe, where it is considered a "great thing." The silk made hy this worm, and fed upon the oak, is said to be much finer than those obtained from any other source. If these facts have anything of value in them, we presume our California sericulturists will not lose any unnecessary time in finding it out and profiting therefrom.

Hints to Hay Makers.

At a lete meeting of the Farmers, Club of the American Institute, Mr. Todd read a paper on hay-meking, from which the following excellent hints are extracted: "If we spread a small quantity of green grass on a floor heneath a roof that will protect it from rain and dew, the moisture will disappear in a few days, and the leaves and stems will be as sweet as grass to the taste of the animal, and it will emit an agreeable fregrance, and no smell of must or dust will be perceived when the hay is moved. These facts furnish an important clue to the process of making hay. There is quite as much danger of injuring the quality of hay by allowing the gress to be cured too much in the hurning sun as there is of haking breed or pies or cakes too much. If grass be allowed to lie for hours, and in meny instances for two or three days, exposed to the hot snn, the hay will appear quite as unpeletable to domestic animels as scorched and dried-np hread does to us. The substances in the newly-mown grass are in a semi fluid and plastio condition. The object in making hay is to dry these substances just enough to prevent their spoiling in the mow, and at the same time retain a kind of elasticity. When the stems and leaves of grass will break and crumhle to atoms, the evidence is conclusive that the hey has been eunned too much. When grass is epread out in the burning sun, es soon as the steme and leaves on the surface have become wilted, the tedder and the forks should be put in motion, and the newly mown hay ehould be tossed ebout continually until every leaf is fit to be raked. By etirring, and turniug, and tedding, other stems and leeves are brought to the surface, where they receive the benefit of the heat of the sun. Besides this, grase will cure in the air much sooner than when lying on the ground. When we gather mint, sage, end elderberries, why are we alweys so careful, in drying such things, to avoid any epontaneous heet, simply because spontaneous heat, efter the moisture hes been expelled, will leave a musty taste and mouldy appearance?"

The Canada Thistle in Oregon.—The Willamette *Farmer* says that the Canada thistle is now growiug upon the premises of Mr. Shindler, in Portland, hy whom its character was not known, but who, ever since his attention wes called to it, has taken pains to eradicate it. At first but one specimen was noticed, which was carefully gruhbed up by the roots; but the next year it still coutinued to spread, and has spread still further the present, which is the third year. Efforts are etill heing made to eradicate the pest, hut as yet with very little success, althongh it has never yet gone to eeed. The *Farmer* thinks the city or county authorities should take it in hand, and cerefully guerd ageinst its epreading. This is one of the most pestiferous and tenacious of known seeds, and if it once gets a foot-hold in Oregon, will spreed throughout the coast, and will work irreparahle damege in our fields. The seed from which this specimen sprung is eupposed to have been brought there in a hox of furniture from the East.

Large Yield.—The Missouri papers are hoasting that a "single stool" of wheat was grown on the farm of J. J. Monaghan, near Sedalia, Pettis county, Missouri, which perfected sixteen heads of wheat, containing 838 kernels. That would he called poor doings to hrag over among farmers on the Pacific Coast. The Oregon *Farmer*, of July 19th, speaks of a single grain of wheat in Boise Valley, Idaho, which produced one hundred and twenty stalks, averaging thirty grains each—making a total of 3,600 kernels. Will our Missouri friends please try again?

Death of the Inventor of the Mowing Machine.—The Rev. Patrick Bell, D. D., of Scotland, who died in April last, was the first to invent a mowing mechiue, with vibrating cutter-bars. His invention was made in 1827, and it is from various modifications and improvements upon this machine, that the celebrated American mowers have been founded.

The Potato Hobby.

Tilton's Journal of Horticulture, in noticing the new-fledged hobhy of seedling potatoes, says: "We have heen gradually approaching the crisis for the past dozen years; in fect, the disease had its origin in the Rohan, in the infant days of other agricultural and horticultural hnmhugs; and it now gives promise of being the richest placer in the whole list. Brohdignag strawberries, clusters of grapes more magnificent than those from the Valley of Eshcol, and other like wonders, have become stale beside the new potatoes.

The Rohan sold at fifty cents a tuber; but now we go three dollars a pound, or a hundred and eighty dollers a bushel, and scarce at that; "demand heyond the supply." This is decidedly aheed of a hundred guineas for a tnlip, of which only a half dozen could be produced in a season, or five dollars for a plant of the celestial *Morus multicaulis*. The Early Rose (no rose can possibly he so good under any other neme) has gone down to the low price of three pounds for two dollars, and is evidently so disgusted therewith, thet it has gone back on its originetors full two weeks on its advertised time of meturity. We cannot, therefore, cap the "climax" short of three dollars a pound."

A Boston paper gives the following information, which, if put into practice, would greatly reduce the eales of fancy varieties of potatoes at exorbitent pricee:

In the letter part of February a gentlemen named Tailby purchased two potatoes at $50 each. They were cut in pieces eech with en eye, and exposed a day or two to dry, and then put in boxes of earth and placed under a glass. One of the potatoes had ten eyes, the other had thirteen, but two of these were bad, so but twenty-one sprouted. In about three weeks the sprouts were two inches high, when they were cut off and placed in small pots, and rooted, and in two weeks more these sprouts were cut in the same manner, and another crop secured from the originel stock; and this practice hes been pursued until Tailby has grown 3,000 plents from those two potatoes, and he hee over a hushel of small potatoes, some of them larger than hens' eggs. Some of the cuttings were grafted into old potatoes, from which all the eyee had been removed, which brought them on a great deel sooner.

Agricultural Items in Brief.

Something for California Farmers to Think of.—Oregon oets have been from five to fifteen cents higher per cental at San Francisco all throngh the season then California. Oregon sent to Celifornia during the year ending June 30, 1867, 122,889 centals of oats, againet 16,325 centale for the like period ending June 30, 1868.

Mowing Machines.—No less than twenty-seven mowing machines were entered for competition at the New England Agricultural Fair in June last.

A Working Sheep.—A eheep in Washington county, Ohio, has, during the past year, churned $200 worth of butter, raised a lamh, and fleece shorn of $3.15 of wool. A profitable sheep. So says an Eastern exchange.

Value of Manure.—A successful deiryman and farmer in Connecticut reckons his stable manure as worth $26 a year for eech animal.

Hay Yield.—The average yield of hey per acre in the State of Messachusetts in 1866 was 1.37 tons. This is a better average than in any other New England State.

A Good Word for Snakes.—The Contra Costa *Gazette*, after noting the value of spiders and toads as destroyers of insects, hurtful to garden crops, has this good word for non-venomous snakes: "A physician of our place, whose country practice makes him a constant traveler of the county roads, has recently euggested to us the propriety of a cantion against the system of destruction which is indulged in towards the common, harmless snakes, scores of which may be seen in a day's ride over any of our highways, victims of the unreasoning animosity cherished and indulged towards the whole species by the descendants of Eve. These snakes, while they may occasionally pilfer a few hens eggs or young chickens, more than atone for such slight mischief by their efficient service to the farmer in destroying field mice, young rats, gophers, moles and squirrels. We were told recently of an instance where no less than ten young squirrels were taken from the food pouch of one of our common garter or striped snakes after it was killed in the road. A little consideration will be sufficient to satisfy any thinking person that the farmer has every motive for protecting instead of destroying our harmless varieties of snakes."

Roots, etc., vs. Hay.—The equivalent of twelve tons of hay can be raised on one acre of roots. Roots and shorts, mixed with the straw of grain or with hay, will sustain a working horse in hetter flesh then hay.

Ocean Telegraphy.

"The gntta percha covering of the copper wires, under the pressure of a greet depth of water, becomes en absorhent of the electricity scnt through them to the extent of 90 per cent. The first portion of the electric wave of 10 per cent crosses the oceau (1,700 miles) in two seconds, and it would be followed by a succession of waves, from the restoration of that portion of the electricity which has been absorbed hy the gutta-percha in impulses, and the signel would he repeated and produce confusion. To remedy this, Professor Varley introduced a key, which sends alternate currents positive and negative, at such intervals as allow the first wave of 10 per cent. to pass forward, and then that portion absorbed by the covering is neutralized by its opposite, and the cable is cleered for the tranemission of a second pair of currents. The battery is a very emall one (three of Daniell's cups). The instrument consists of a minute polarized needle, suspended on a single strand of a spider's weh, or one from the silkworm. In the middle of this minute needle is placed an elmost microscopic mirror, which reflects a single rey of light from a powerful lamp. The currents of electricity deflect this needle alternately to the right and left, for a space of time corresponding to that occupied in the signel on the lend line, the same kind of alphebet heing used in both cases. The receiver (not operator) sits in a dark room, and the small mirror reflects the ray of light upon a piece of white paper before him, on which a black line is drawn, to the right and left of which the light is alternately reflected. The receiver reads these eignals by "eight," and transmits them to another person, placed outside of the dark room, by means of en ordinary instrument."

The ehove, from W. J. McAlpine, well describes the use of the Thompson galvanometer in ocean telegraphing. By means of this exquisitely delicate little instrnment, every roll of the Great Eastern, during her recent laying of the French Atlantic cable, gave proof to the wetchers at Breet that the ship wes safe, and the connection complete; the elight current produced in the coils by the motion being sufficient to prodnce an infinitesimal deflection of the needle which the glencing point of light would alone suffice to record.

One Form of Coöperation.—Workmen and others in Connecticut are forming clnbe for thc purpose of huying coal by the cergo. They thereby save a couple of dollars, if not more, on the ton.

[From the San Francisco Daily Herald, Aug. 6th.]

Mechanics' Institute—Polytechnic Association.

The regular monthly meeting of the Mechanics' Institute was held last evening. The President submitted his quarterly report, representing the affairs of the Institute to be in a very prosperous and flourishing condition. There are now 5611 in the treasury, and many valuable additions to the library have been made. Matters pertaining to the forthcoming Exhibition are very promising; over three-fourths of the space in the Pavilion has already been engaged. Many applications for room to exhibit articles have been received from the East. The Board has decided to use the upper galleries of the Pavilion as bazaars for the sale of articles. This will be an entirely new feature in the Exhibition.

September 14th has been decided upon as the opening day, that being the centenary of Humboldt.

The British Minister has called the attention of the Institute to the fact that the Exhibition to be held in London in 1870, is to be an exhibition of the skill of the mechanic rather than that of the product of the manufacturer, and the President suggested that the mechanics of California contribute some of the mechanism of their skill. After the reading of the President's report, Mr. W. B. Ewer read the following interesting and instructive paper upon explosives:

The sudden and violent expansion of a body, by its component parts acquiring a great increase of bulk, has been termed *explosion*. This result is usually brought about by the application of heat to certain combinations of solids, whereby they are suddenly converted into gaseous forms. One remarkable feature in such explosions is the immense velocity and force with which the gases so produced expand. Another is, the intense degree of heat evolved by the new chemical combinations and reactions which thus take place.

Early Discovery of Gunpowder.

The agents most anciently, and still most commonly, employed in the manufacture of explosives are nitre, sulphur and carbon, which, when properly combined, are known as gunpowder. When these agents were first mixed for explosive purposes is very uncertain. The "devouring fire" and "earth thunder" of the Chinese writers, centuries before the Christian era, undoubtedly referred to such a mixture. Ancient Hindoo, as well as more modern Greek and Roman writers, contain numerous passages which point most unmistakably to the knowledge of such an explosive. Alexander the Great is supposed by many to have found his conquering progress eastward stopped by a nation possessed of the secret art of making gunpowder. We hear of similar demonstrations at the siege of Syracuse, where, we are told, engines were used which threw stones with a great noise. In short, from a great mass of evidence within our reach, the conviction is forced upon us that the manufacture of gunpowder, very nearly as we now have it, has been known to a few among the learned men of all ages.

The reason of its not being more generally known and employed among the ancients may reasonably be attributed to the fact that all kinds of learning, and especially chemical knowledge, were in early times studiously confined to a few, for the reason that by such limitation great distinction and influence was attached to its possession. The magicians of ancient Egypt, who ambiguously essayed to measure their knowledge and power with that of the heaven-inspired prophets of God's chosen people, were of this class.

For many years after the knowledge of this compound had been freely given to the world, its only employment was still in the direction of war. The Venetians were the first to take advantage of its re-discovery; but it was at the famous battle of Cressy that it gained historical position. From that time to the present, hand to hand conflicts, in the manly style of old, have become more and more impracticable, until battles are now universally fought with a *grand flourish*, at respectable distances; and what modern days have most justly ridiculed as "fuss and feathers" have found welcome and most efficient aid in "villainous saltpetre."

Its Introduction Into the Useful Arts.

Considering the wonderful power exhibited, from the first, by this explosive compound, it is a little remarkable that so long a time should have intervened after its *general* introduction into the art of war, before any one suggested the possibility of its employment in the more quiet and useful arts of peace. But so it was—the pick, the lever, the wedge, the hammer, and fire, were still for centuries the only agencies employed for breaking down rocks in the prosecution of the various engineering operations connected with road building and other rock excavating. But in time the happy thought *was* conceived, and successfully carried out, of applying this force as an agency in that direction. Its application was so novel and efficient, that it was not inappropriately suggested as entitled to the distinction of being known as a *new mechanical power*. When, or by whom it was first so employed is not known. The indefatigable newspaper reporter was not then abroad, or the circumstance would undoubtedly have been duly recorded, and handed down to posterity, as one of the most important events in the history of mechanical progress.

Improvements in Its Manufacture.

But little attention appears to have been paid to improvements in the manufacture of gunpowder, until about the commencement of the present century, when numerous experiments were undertaken to more perfectly adapt it, by various modifications in its manufacture, to the diverse uses to which it was now being applied; and also to add to the intensity of its explosive power. It was during these researches, and at a time when chemical science had begun to make rapid advancement, that the various *fulminates* were discovered, consisting of the salts of fulminic acid combined with certain bases, as of gold, platinum, mercury, silver, etc., all of which possess, in a greater or less degree, violent detonating properties. Chlorate of potash was also, about this time, proposed as a means of increasing the explosive powers of gunpowder; and numerous mixtures and modifications of this violent explosive have from time to time, until the present day, been presented with special claims to superiority.

But all such mixtures appear to exhibit important and radical defects. It seems that the violently explosive nature of the chlorates cannot be sufficiently toned down to render them safe for handling, or at all applicable to gunnery.

Paper powder is, perhaps, about the safest application of chlorate to blasting purposes which has yet been proposed. But the conditions of even this manufacture are such that it cannot be produced with a sufficient degree of uniformity to be made reliable for general use.

Horseley and Ecnhardt have each introduced chlorate compounds, in which efforts have been made to render the violently disruptive forces of such powder comparatively safe and practical. The Ernhardt powder is now being extensively manufactured at Baltimore, and has been introduced to some extent in the Middle and Eastern States. These compounds are prepared in two separate parts, which are not mixed until used. They are inexplosive separately, but said to exert eight or ten times the force of gunpowder when mixed. Water may be used for tamping, and no smoke or offensive odor results from the explosion.

Mr. Hafenegger, a Prussian, and resident of this city, has recently obtained a patent for an explosive, similar in some respects to the above, and which combines, in a notable degree, the qualities of safety and cheapness with most powerful explosive powers—several times greater than gunpowder. We are not aware that any special effort has been made to introduce this explosive.

Several compounds, variously made up of mixtures of chlorate of potash, with ferro cyanide of potassium, and with prussiate of potash—white sugar being added in each case—were introduced a few years since in Germany, under the general name of *white powder*. It is said that the process of the manufacture of these compounds is attended with little or no danger; that they are much stronger than common black powder, free, to a great extent, from the violently explosive character of the ordinary chlorate powders, and absolutely free from fouling—a very great desideratum in gunnery. No accidents have been reported from their use or handling, so far as we have been able to learn; but they do not appear to have entered into practical use—perhaps because they needed a little Yankee energy to make them go ahead, commercially.

A powder presenting some very remarkable characteristics was introduced about five years since by Neumeyer, of Saxony, to which the term "inexplosive" has been applied, from the fact that there is no possibility of exploding it, either during its manufacture, storage, or manipulation. Its energy is developed only when rammed home or placed under considerable pressure; then, weight for weight, its explosive power is considerably in excess of common powder; while bulk for bulk, it is fully equal. It is not injured by being thoroughly saturated with water and dried.

The ingredients entering into its composition are the same as those for common black powder—the secret of the extraordinary result obtained being solely due to the method of proportioning and compounding its ingredients. Less sulphur is employed, and hence a less quantity of noxious vapors are evolved—a point of great importance in underground mining. Modified modes of manufacture are employed to suit it for various requirements of either military or blasting purposes. Its cost is less than that of ordinary powder. In blasting it is said to be equally applicable to hard and close rock, as to that which is soft and seamy. A very good idea of the peculiarity of this explosive may be formed from the report of an exhibition of its properties at the grounds of the London Crystal Palace, three years ago. A small house, five feet square, built of brick, with heavy slate roof, and two open chimneys, made of five-inch tiles. In this house was placed loosely thirty-five pounds of Neumeyer's powder. On firing it, a large body of flame shot upward through the chimneys and continued until the powder was burned out. Not a brick, tile or slate was moved. Subsequently, three pounds of common powder reduced the building to numerous wreck. This experiment was made to show the safety of the Neumeyer powder when placed loosely and fired. Other experiments were made at the same time, to show its powerful energy when tamped in a bore-hole, or rammed in a gun-barrel.

If the reports with regard to this powder can be relied on, it presents absolute safety in manufacture and handling, with all the efficiency of the best gunpowder when rammed or tamped; coupled with greater immunity from deleterious gases, and equal cheapness in cost and carriage. Notwithstanding its apparent advantages, however, it does not seem to have come into practical use out of Germany, although *there* it still continues to be extensively manufactured and employed. There are numerous other explosive compounds which might be properly presented in this connection; but the brief time allowed for this paper requires that we should hasten to a consideration of the two most potent and promising explosives with which gunpowder has to contend—nitro-glycerine and gun-cotton—in their lately modified forms of manufacture. The former has been known to chemists for over twenty years; but its practical application as an explosive agent was first made by Mr. Nobie, less than six years ago. The latter—gun-cotton—was discovered by Schernhein, in 1846, the year previous to the discovery of nitro-glycerine. The extreme simplicity and safety of the mode of manufacture of this compound at once arrested the attention of manufacturers of explosives, and establishments for its manufacture were very soon erected in nearly every country on the European continent.

Gun Cotton.

Gun-cotton was originally prepared by simply placing the ordinary cotton of commerce, first thoroughly washed and dried, into a bath composed of a mixture of strong nitric and sulphuric acids. The chemical substitution takes place in about forty-eight hours, after which the cotton is removed and simply washed to remove the adhering acid. This, however, was a very tedious and slow process, and was often secured by placing it in a running stream for three or four weeks.

The explosive so produced was soon found to be extremely uncertain in its character and stability. Inexplicable disasters followed each other so rapidly that people soon lost all confidence in its use. But the chemists were still unwilling to give it up, and began to study earnestly for the cause of its instability, which was soon traced to the presence of free acid, that had not been removed in the washing. This acid, by the action of sunlight and air, underwent a process of decomposition, which often generated sufficient heat to cause an explosion of the mass. More thorough washing was tried, but without avail—explosions would occur. Various devices of winding, twisting, plaiting, and confining in air-tight cartridges were resorted to in order to remove, as far as possible, this danger. Saturation in water was also tried, and was undoubtedly the best device adopted for isolating the explosive. As is well known, each fibre of cotton consists of a long narrow tube, often twisted and doubled in every possible manner; and while the acid, by its penetrating qualities, would readily find its way into every recess, the water that was subsequently employed to remove it failed to reach many of those minute labyrinthian channels; hence the retention of a small portion of acid in spite of the most careful and protracted washings.

The difficulty thus appearing quite insuperable, gun-cotton has been nearly abandoned as a blasting agent, but still continues to be an object of great interest, on account of its application to the beautiful art of photography, and its large use in surgery in the form of collodion, which is simply gun-cotton dissolved in ether.

Such was the status of this explosive, when, a few months ago, a happy thought occurred to Professor Abel, an English chemist, that it was only necessary to destroy the tiny little tube in which was bottled up all the danger, to be let out at times, and often under circumstances so mysterious and unexpected, by simply purging the cotton—grinding up the fibre as rags are ground to a pulp for making paper. This being done before it was submitted to the acid bath, he rightly thought the subsequent washing away of the surplus acid would be a comparatively simple process, and one which might be made absolutely perfect. Subsequent experiment more than realized his anticipations, and not only rendering the cotton absolutely free, so far as time has yet shown, from any possibility of chemical change, but furthermore, to his astonishment, placing it in a condition perfectly inexplosive, in the open air, under any ordinary conditions of exposure or manipulation. The Professor has thus attained for his improved explosive the same modification of the original compound which had already been so unexpectedly secured by Neumeyer in his modification of common powder, and to which we have referred in the experiments at the Crystal Palace.

By this simple change in the mode of manufacture, without the addition of any new substance, Mr. Abel has so essentially modified the nature of gun-cotton that, besides the advantages already mentioned, it can be exploded in the open hand without danger; and so quiet is its combustion under such circumstances, that a delicate gold balance, in the pan of which it may be ignited, will not swing from its poise. And yet, when pressed into a cavity, and there ignited by percussion, it explodes with a force nearly equal to nitro-glycerine, and some eight or ten times greater than that of gunpowder.

The most recent report from this improved explosive is the result of some experiments made in January last, from which it appears that although the application of heat alone will produce only a slow combustion in the open air, still when percussion is applied, even to a loose mass, it explodes with all the violence of nitro-glycerine. Absolute safety, however, appears to have been obtained from self-ignition or from any dangerous spontaneous chemical change. Those experiments, so far as can now be seen, show that this late improved gun-cotton is more safe than gunpowder, for either use, storage, or transportation; while in efficiency it is multiplied many times. This interesting discovery is really the latest advance in the manufacture of explosives; and goes far to encourage the belief that gun-cotton may yet again come into use as a blasting agent. The fact that it is entirely free from any deleterious influence on the health of those who use it, is also a most important consideration.

Nitro-Glycerine.

The second, and just now most promising rival of gunpowder, is nitro-glycerine, which we have already said is no very recent invention; although its first introduction as an explosive agent dates back less than six years. The terribly disastrous results which attended the early introduction of this composition as an explosive are too well known to need any reference here. They have been brought painfully near to our own firesides. It is sufficient to say that this explosive, as first introduced, is now very generally abandoned; but the principle upon which it is based has not been lost sight of.

Experience is fast rendering almost universally applicable the maxim that to be forwarned is to be forearmed. When any known condition of danger is given, science seems ever ready to provide a way for immunity therefrom. It is only by reason of ignorance that we are unable to safely manufacture or handle any explosive. When we fully understand the nature and condition of the danger, we can then devise a remedy for its removal. Should we banish edge-tools, steam and gunpowder because they are dangerous, and because people will sometimes be careless? Let us rather look upon what are called accidents, even though inexplicable at present, as indications of something to be learned—something to be invented. In this age of scientific and mechanical progress, he should be considered behind the times who pronounces anything impossible. Ars we not about to fly?

Giant Powder.

This distinguished scientist who first demonstrated to the world the terribly effective energy of nitro-glycerine was by no means discouraged at the disastrous results which followed; but, like a true follower of science, at once set himself to work to seek out the hidden cause of its danger, and apply the proper remedy. His efforts were crowned with most unexpected success, and the same explosive has now been introduced, in a modified form, which is far safer than common powder, while it retains the full efficiency of the original compound. We have no time to pass in review the steps which have gradually led to this result, or the experiments by which its attainment has been proven. It is sufficient to say that the result is an accomplished fact, and Mr. Nobel has coined a new word to give his new compound an expressive name—*dynamite*. The dynamite of Europe is the giant powder of California. It is simply a new form of nitro-glycerine. A peculiar infusorial earth, finer than the finest flour, and yet consisting of the silicious coverings of what were once a shelled animalculæ, are saturated with this oil, and we have a brown powder, looking more like fine sawdust than anything else, and apparently as innocent of any destructive power as the dirt of the street.

The question of the safety of this new explosive is now, we believe, beyond a doubt, and we will not stop to dwell upon it, but pass immediately to what, just at this time, appears to be a more important consideration—the effect which its explosion is said to produce upon the health of those who use it in a mine.

How Its Use Affects the Health.

Experiments were made to test the action of nitro-glycerine upon the animal economy long before it was employed as an explosive agent. They were made from both a medical and a chemical standpoint. Inhalation, and placing it upon the tongue in a diluted condition, were both employed. The effects were extremely uncertain and contradictory—the same as now found in the practical use of the compound. Acceleration of the pulse, headache, and general prostration were the result, when sufficient quantities were employed; but it was found that a great difference of susceptibility existed among those to whom it was applied. Experimenters at this time had no other intent in the matter than to further the cause of scientific research. It was not then, as now, an important commercial article, out of which interested motives might grow to influence the views or observations of experimenters. All agree in the general results and conclusions.

It was found that one-twenty-fifth, and in one case one-forty-fifth part of a single drop—obtained, of course, by large dilution in a proper solvent—would produce the same effect upon some constitutions which, in others, required *two full drops*; or, in other words, the difference of susceptibility in individuals varied from one to nearly one hundred. These observations are amply sustained by the practical experience of the present day, and fully account for the apparent contradictory reports which we hear of its effects upon the health of miners. One is severely affected, another slightly, and others not at all.

We all know the effect of poison oak upon different constitutions; while one individual possesses perfect immunity from its effects in any form or under any circumstances, another can scarcely pass near one of these plants without becoming more or less affected by its influence. Persons who are susceptible to the effects of nitro-glycerine should let it alone, as those do poison oak who are susceptible to the poisonous influences of that shrub. Experience and observation teach us that the number so affected is very small—not enough to at all seriously interfere with its general use. Moreover, this susceptibility rapidly wears away with many by constant exposure, until, under ordinary circumstances, those who were seriously affected at first no more perceive any unfavorable influence—less even than they experience in the use of gunpowder.

A mistaken idea has gone abroad to the effect that the injurious consequences of its use result from the inhalation of the gases produced by its explosion. Nothing could be further from the truth. The only gases resulting from properly exploded giant powder are carbonic acid, free oxygen and free nitrogen, with the vapor of water. Their relative quantities, both in bulk and weight, have been accurately ascertained. Precisely the same gases are liberated by the explosion of gun-cotton, simply varying a little in their relative proportions and qualities; and yet gun-cotton is considered one of the most harmless of explosives in this respect.

The gases resulting from either are, in fact, far less injurious than those from the very purest of gunpowder—for that explosion liberates all which come from nitro-glycerine, and in addition, large quantities of carbonic oxide and sulphureted hydrogen—the nature of which latter is well known to all who have refreshed themselves upon the gases emanating from the breaking of a very ancient egg.

The mischief produced from the explosion of giant powder, when any arises, proceeds from the vaporization of a portion of the compound which is but partially decomposed, or burned, but not exploded. This vapor, suspended in the air, comes in contact with the tongue, or is taken into the lungs. Of course, the quantity so absorbed into the system, where ordinary care is taken, is infinitesimally small—so small, indeed, that no effect is produced except upon the most susceptible constitutions. If proper care is used in charging the blast, and a perfect article of powder is employed, it is impossible that any vapors can arise. Vapors may occur, however, from two causes. First, improper charging of the blast. If, in placing this explosive in the chamber, it is poured in so that any portion of it comes in contact with the walls of the chamber, above where the top of the powder rests, a small portion will adhere to the walls, and not explode by the impact which fires the charge, but be driven out in the form of nitrous acid vapor. That is the vapor which does the mischief. Now, to avoid this, all that is necessary is to load the charge by means of a funnel-shaped tube, which will convey this powder to the bottom of the hole without allowing it to come in contact and adhere, even in the smallest proportion, to the walls above the charge. Very few, we believe, take such precaution, although such care is generally recommended by the dealers in this powder.

Another difficulty has no doubt arised from the employment of an imperfect article. When the manufacture of giant powder was first commenced in this city, an inferior quality of acid was employed, which produced a powder that would not completely explode, but gave off a very small quantity of the nitrous acid gas already spoken of. These defects in the manufacture have been removed, and it is claimed that a much superior quality of powder is now prepared. It is confidently believed that the increased degree of perfection which is constantly being attained in all the various steps of the manufacture, and the improved modes of exploding the charge which are now applied, will yet be able to secure for giant powder as perfect an explosion as has been attained for gun-cotton. When this end is fully realized no possible trouble can be encountered in this direction. We shall, indeed, have attained the disideratum which has ever been sought for by all manufacturers of special explosives for blasting purposes—viz: a compound which shall possess a more violently explosive action than can be imparted to any of the sulphur compounds; which shall either cost less, or, what is the same thing, do a greater amount of work in proportion to its cost, while at the same time it shall be equally safe or safer for the lives and health of those employing it.

Its Comparative Explosive Force.

Another very important matter to be considered in the choice of explosive agents for blasting purposes is the relative bulk which may be required to produce a given explosive effect.

The smaller the bulk of the explosive required, the less will be the labor and cost for drilling out the chamber. It is claimed that in this respect giant powder has an advantage of nearly 100 per cent. over gun cotton, and 800 over common blasting powder.

An elaborate series of experiments has been made, by order of the Austrian Government, to test the relative explosive force of these three compounds, which appear to fully sustain these claims. These experiments were undertaken mainly for military purposes. We have here a diagram, copied from the official report, showing the comparative effects of the three kinds of explosives, etc.

Single and Double-Handed Drilling.

The almost universal testimony of mining engineers and superintendents on this coast, who have employed this powder, is to the effect that ores can be raised by its use nearly or quite one-half cheaper than by ordinary blasting powder. This gain is mainly effected in the saving of labor in drilling, as one man can generally do more drilling for this powder than two men can for that in common use. For the one single-handed drills can be employed in almost all cases, while the other almost as universally requires the use of double-handed drills. When we bear in mind the fact that a very large proportion of the labor of getting out the ore and extracting the precious metals therefrom is chargeable to the single item of blasting, some appropriate idea of the immense economic value of such an agent may be formed.

If we are not mistaken in our estimate of the value of this explosive, it must be considered as one of the most important economic aids to engineering operations, requiring the removal of hard rock, which has yet been produced. Its value to this State, if it can be generally introduced, can scarcely be estimated. It is to be hoped that the only objection now urged against it—its supposed injury to health—may soon be entirely removed. Honest and earnest efforts are being made in that direction. Our people generally, and the miners especially, who are called upon to employ it, should do so with unprejudiced minds—willing to countenance and encourage whatever may tend to reduce the cost of working, *without cheapening labor*. The same economy which induces the introduction of the new agent, will not fail to care for the lives and health of those skilled in its use.

Rifle Powder for Blasting Purposes.

Had this paper been read two weeks ago, there would have been no occasion for any further reference to gunpowder; but within a few days past the fact has been brought to the knowledge of the most, or all of those present, that some experiments have recently been made in the Empire mine in Grass Valley, with rifle powder as a blasting agent, and with, as reported, most unexpected results; the gain over common powder being very decided. It is possible that further and comparative experiments may lead to an extensive substitution of the more expensive and stronger rifle-powder for that ordinarily made for blasting purposes; although in the light of present knowledge, nothing more than this brief mention can be made.

Improvements in explosives constitute a matter of the greatest importance to human industry everywhere. The highest ingenuity, talent and learning of the day, are engaged in efforts to render more cheap, safe, and effective, the various explosive agents for which modern engineering enterprises are making such large and increasing demands. In no department of industry is such a want more deeply felt than in mining; and from the results of the last three or four years, we may safely say that the world has, through this means, entered upon an era of cheaper and more effective mining—one which in the end will prove equally satisfactory to miners and mine owners.

Conclusions.

The most terribly effective explosives which modern research has revealed, and which but a few months since were regarded as beyond human control, are now presented to us, ready for work, and as harmless for mischief as so much dust under our feet. They may be transported with absolute safety, or handled by a child with impunity, while unconfined; but imprison them, and all the mighty energies which are locked up in nature's secret store are called into exercise to burst their bonds. These important results are among the marvels of this wonderful age; and yet, considering the rapid strides which are now being made in scientific researches, we should not be surprised to see even these wonderful achievements utterly eclipsed before another decade shall have been added to the onward march of time.

Mr. Ewer was listened to with marked attention, and at the close of his reading received a vote of thanks from the Institute.

MAYFIELD, Cal., June 26, 1869.

DEWEY & Co., *Patent Solicitors, San Francisco*—Gentlemen:—In acknowledging the receipt of my Letters Patent, allow me to express my thanks for the skillful and trustworthy manner in which you have conducted my business before the Department at Washington. I am perfectly satisfied with the high degree of ability and integrity displayed in the management of my case, and I know of no similar agency in which I could place corresponding trust. Yours truly, J. M. JOHNSON.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the PRESS from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any part longer than it is desired. If we inadvertently do so, subscribers or others will please inform us.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Big Work.—*Miner*, July 24th: Last week the Imperial tunnel was pushed in 22 feet, and now shows a total length of about 1,030 feet.

Mountain.—This claim, in Monitor district, shows a continuous vein. The length of tunnel to the point where the lode was struck is only 50 feet, and the depth under ground not more than 30; yet the lode seems solid, and the ore yields by assay from $25 to over $100 per ton in gold and silver.

CALAVERAS COUNTY.

Items.—*Chronicle*, July 31st: We are informed that since the completion of their branch tunnel, Paul & Co., whose claim is located near the Junction, are taking out large sums weekly....Brackett & Co. have also again struck the lead....Mr. Shaw's hydraulic "gives out" frequently, but we notice that his countenance is wreathed with smiles upon such occasions.

EL DORADO COUNTY.

Georgetown.—Placerville *Democrat* correspondence, July 28th: The Eureka Co. have got their mill started, but as yet have made no clean up. I am informed that the rock prospects well. Work was started last week in the tunnel. On the Taylor ledge, Gibbs, the Supt., is getting ready to put up the additional battery, and to sink the shaft another hundred feet. Wood & Co. are getting their mill along finely. The Woodside still awaits some energetic company, with capital, to pour out its treasures.

INYO COUNTY.

Cerro Gordo.—Los Angeles *News*, July 31st: Five wagons arrived in this city on Wednesday afternoon, bringing 400 bars of lead and silver bullion from the Belshaw furnace, Cerro Gordo. Three new furnaces are near completion in that vicinity. Water is very scarce, and but little mining or smelting can be done until the springs rise or the rainy season sets in.

MARIPOSA COUNTY.

New Quartz Mill.—*Mail*, July 80th: A 10-stamp quartz mill, situated four miles from Colorado, was completed last week, and has been crushing quartz from the Feliciana mine. A tunnel which taps the vein 400 feet below where the same was formerly worked, was finished a few months ago. There are 300 tons of good quartz now at the mill. The motive power is steam. The mine and mill are the property of Mr. Louis Trabucco.

On Sunday, a Chinaman picked up a piece of quartz, with gold, near McLennau's ranch, and disposed of it for $40. It has been found to be worth about $200.

Letter to same from Hornitos says: "The great prerequisite to the development of this rich mineral region is water; and if the Mariposa Co. would study their own interests, they would lose no time in constructing a ditch from the South Fork of the Merced of sufficient capacity to supply the entire country. This great mining district is 90 miles long by 25 in width of placers, and embraces thousands of rich quartz veins, to the development of which the waters of the Merced might be applied with ease. All the Mariposa Co. need to do to make up for all their former backsets is to raise half a million of dollars, construct a ditch, lease their placer and quartz veins, and we can prove to them by figures carefully calculated that the net income of said operations would not be less than $2,000 per day."

NEVADA COUNTY.

Items.—Grass Valley *Union*, August 29th: The Idaho cleaned up day before yesterday, after a two weeks' run, and the result was $12,500 in gold.

The Dromedary has been started up.

The Empire mine has all the miners it needs in drifts and stopes, and the mill is now running night and day on splendid looking quartz.

Allison Ranch.—Same of 30th: We visited this mine yesterday. We took up a number of pieces from the dump, and did not fail to find the yellow metal in any of it. It is estimated that the rock taken out will yield about $50 to the ton, but we believe it will do more. The mill will start to-day. A solid foundation of heavy stone masonry is being put down for hoisting works at the middle shaft. A new pump will keep the mine free of water. The old dump pile is rapidly disappearing under the stamps, and it has paid well. In fact, it has paid about forty per cent. of the expenses of all the heavy work which has been done in reconstructing the mine.

Mining Review.—Same of August 1st, says: "Taking a general view of the mining situation at Grass Valley, there is great cause for encouragement, and the prospects for a lively fall and winter are bright." North Star starts up in ten days. There is an immense amount of pay ore in sight. ....The Harterey cleaned up on Friday after a seven days' run with eight stamps. The amount realized was $3,012. There are 23 men working.....The Wisconsin mine employs 45 men, and the company are taking out good rock. McCauley's mill of Boston Ravine is now crushing a lot of rock from the Wisconsin, and good judges say that it will yield upwards of $40 per load. The company intend to put up a mill of their own.....The West Eureka is being worked all the time. An incline shaft has reached a depth of 50 feet. Some good rock has been taken out, and good prospects of free gold have been obtained from it.....The Union Hill mine employs 70 men, and bids fair to take a front rank. ....The West Idaho, near Slate Creek, is being worked. An incline has been sunk 50 feet.....The Empire is full of hands, and the mine and mill are worked day and night. The rock coming out is fair..... The Eureka and Idaho are doing as usual.

Rich.—*National*, July 31st: A couple of gentlemen at Allison Ranch yesterday, in order to test the richness of the rock, "timed" one of the stamps, and after a run of six minutes the blanket was washed and over 1¼ ounces of gold was realized.

Good Yield.—*Gazette*, August 3d: A crushing of quartz from Holbrook's ledge, recently made at Stile's mill, was cleaned up on Saturday, and yielded $33 per ton.

Sulphurets.—*Transcript*, July 30th: Clark & Days have just worked up 6¾ tons of sulphurets from the Wiscousin mine, which realized $92.59 per ton.

PLUMAS COUNTY.

The Crescent.—Quincy *National*, July 31st: We understand that this mine is looking better than ever before since it was opened. The rock is paying largely. The company are running 24 stamps and we are informed intend working the mill (36 stamps) to its utmost capacity in a short time.

SISKIYOU COUNTY.

Trinity Center.—Yreka *Union*, July 31st: Messrs. Cunnin's & Blackburn are opening some rich claims two miles above the American House on the Trinity river. They have flattering prospects. Mr. Fitch has struck some rich and extensive diggings near Trinity Center; three hands took out over $600 in less than three weeks.

TRINITY COUNTY.

Weaver Basin.—*Journal*, July 31st: The mining claims in weaver basin generally finished cleaning up this week. Particulars in our next.

Found Diggings.—Dick Brown, who commenced a tunnel between Fivecent gulch and East Weaver creek, has found ground that will pay good wages.

The Big Ditch.—A large number of claims have been located on Bolt's hill and vicinity, during the week, in contemplation of a supply of water being furnished from Stewart's fork.

Weaver Creek.—The Weaver Creek Fluming Co, has arrangements made to put in sixty boxes of flume this season.

Pay Rock.—*Appeal*, August 1st: We learn from disinterested parties that the Pennsylvania Mill at Brown's Valley has just retorted the product of 100 tons of quartz from the mine of the company—result five pounds of solid gold, valued at $1,300.

Colorado.

Central.—Cenver *News*, July 23d: A telegram from Central says that mining matters are prosperous. The Coaley lode has a 7-inch crevice of silver that sells for $350 per ton, 25 tons of which have been taken out in the last five weeks at an expense of $1,400. The Smith & Parmelee Co. shipped on Tuesday 179 ounces of gold, the product of six days run from second-class ore; currency value, $4,200, at an expense of $1,600. They get $125 per ton for first-class ore, and have enough of this in sight to keep them busy two years. Bullion shipments this month will be about $260,000.

San Louis Valley.—The Georgetown *Miner* says: "This entire country is being thoroughly prospected this season, and some important discoveries are being made. Col. Pfeiffer, one of Kit Carson's men, is exploring and prospecting the San Juan country, having with him 15 experienced miners, late workmen in the Cimarron mines, New Mexico. The mountains at the head of Hyerfano are being examined for gold. In that district Green Russell has struck fine paying diggings. Mr. Irwin informs us that there are 12 men at work at Union Gulch, Lake county. In California Gulch, says Mr. Baker, work is going forward with commendable activity and evident success. The 5:20 mill has suspended operations for the present. Pilot lode, in the same neighborhood, is paying largely from a dirt crevice. Have taken out as high as two ounces to the pan."

Prize Lode.—Central City *Register*, July 29th: We paid a visit on Monday to the Central Co's works on the Prize lode. Since our last the ore has improved both in quantity and quality. The mill has been started up, and 66 ounces of retort was the result of the first weeks' run, cleaned up on Saturday last.

Pleasant View Lode.—The shaft is 140 feet deep; the crevice from four to eight feet deep. The prospects are more flattering than ever.

Consolidated Gregory.—We are informed that the ore has been steadily improving in quality, and now runs from five to six ounces per cord.

Smith & Parmelee.—The stamp ore last week yielded 7¼ ounces per cord, and they run 3⅓ cords per day. The last lot of smelting ore sold was also considerably richer than any previous. The mill has recently been thoroughly repaired. The company is now free from debt, and realizes a handsome profit. The whole product of the mine for last week, including that from ore supplied to some 20 stamps outside of their own mill, will be about $4,000.

Enterprise Mill.—Last week several cords of ore from the Jones lode yielded 20 ounces per cord.

Idaho.

Items.—Silver City *Wave*, July 30th: The Minear mill has been crushing rock from the Home Resort lode ...The placers on Florida Mountain are showing better. ....J. H. Bixby has struck a ledge near Ruby in the placer ground. We hear that it prospects well.....The Idlewild mine on the mountain is being developed by Mr. Thompson.....L. F. Alpey is developing a ledge a short distance above the Home Resort. He has shown us some very good samples of ore.....Judge Watson thinks he has struck the mother of the whole family and system of ledges on War Eagle Mountain. He calls his discovery the Emerald.....The Allison hoisting works is a very complete piece of machinery. Some of the finest ore is coming out of the 150-foot level, which is being driven north and south from the main shaft.....We are assured that there is more work now being done on outside mines, that is to say, mines that are not usually counted as producers, than ever before since the discovery of the camp.

Idaho City Bedrock Shaft Co.—*World*, July 22d: This new company have secured title to bar and creek mining ground commencing at confluence of Moore and Elk creeks, and extending northerly along Bannock Bar and up Elk Creek some 1,000 feet, and have secured use of steam engine and boiler at the Lambing mill for hoisting and pumping purposes. The site selected for sinking a bedrock shaft, ten feet in length by five feet in width, is just below the corral of H. Goff on south side of Wallula street. Operations for sinking shaft and removing engine and boiler to the site of the shaft commenced on Monday morning last. The work is to be done by subscription.

The same of 29th says a double shaft has already been sunk and timbered to the depth of 45 feet. Two gangs of four men each labor at it night and day, and yesterday was the ninth day. The hoisting apparatus will be attached this week, and next week, perhaps, the steam engine pumping rig will be in operation to keep the shafts free of water.

Pioneer Quartz Mill.—Mr. James M. Classen has sold the splendid 25-stamp mill of the Pioneer mine on Granite Creek, to the Gold Hill Mining Co. The new owners will start the mill on ores from their own mine in a few weeks.

J. J. Tompkins and others have commenced to construct a ditch to bring water from Mooro Creek, about ten miles above here, to a gulch near the Gambrinus mine, where very rich prospects have been struck for a long way down the gulch.

Montana.

Highland.—*New Northwest*, July 23d: Work is going on at Discovery and the Cooley claims—only a few inches of water, however. The Bedrock Flume Co. get some 300 inches one-third of the time by reservoir. Nevins, Florence & Co. are running their arastras on Only Chance rock, crushing about four tons per day. It yields $100 per ton. It is said Prof. Swallow's mill will start up soon.

Phillipsburg.—A few are taking out rock for reducing, but so far no positive assurance of the time when stamps and pans will move has been given. Did miners have any assurance of a reasonable tariff for manipulating the ores under a good amalgamator, at least 100 men would set to work developing their property within 10 days. A new company, composed of experienced millmen, will, it is thought, erect a 20-stamp mill this fall. The Hot Spring Co. have again struck the ledge upon their mine, and richer than before. D. Brown is opening No. 1 east 1,000 feet northeast from the Hot Spring. Keep & Co. are engaged upon the Salmon lode, and extra labor has been put on the Mountain Queen. The St. Louis Co. have set teams at work hauling ore from their mine.

Gallatin.—*Republican*, July 24: There is prosperous placer mining at Washington Gulch, in this county. Some 30 or 40 men are engaged. On the hill this side of Sterling parties are collecting rock from the surface which by mill working pays $40 to the ton. About three miles below Sterling, Bradley is crushing in his arastra rock which paid two ounces to the ton. Half a mile below, an arastra is crushing rock taken from the surface near the Red Bluff lode which is paying a good dividend. Hall & Spaulding's quartz mill is running with great success near Sterling, on Meadow creek. The ore is taken from the Mother Hendricks lode.

Argenta.—Major Veale informs us that Argenta is looking up. In his furnace and lodes constant employment is given to 15 men night and day, and about as many more in the Tootle & Leach furnace. The Atlantic Cable lode has been worked to the depth of 60 feet; the Eaton, 110 feet, and the owners of lodes in the vicinity have all recommenced work with a hearty good will.

Green Campbell.—A shipment was made from this lode, a few days ago, amounting to $9,000, and another on Tuesday of $6,000. There is already 1,500 tons out, ready for the mill. The crevice is 9 to 15 feet in width. The exact yield will average $20 to the ton by the present process.

Red Mountain.—Col. Frothingham intends to set men at work on his quartz property immediately. He represents a large amount of capital, and will operate on a large scale.

Nevada.

COPE DISTRICT.

Placer Diggings.—Elko *Independent*, July 31st: Enright, the Cope expressman, brings more good news from that district. A Frenchman discovered new placer diggings four miles from Cope. He washed but one pan of dirt and got 15 cents.

Two Tons of Silver.—The express car of Wells, Fargo & Co. that passed through here on Friday afternoon had in it *two tons of silver bullion* for New York. "The mines of Nevada are giving out."

Little Giant.—Correspondence Grass Valley *Union*, July 30th: We have struck it rich in the Copo country. Our ledge is called the "Little Giant." The rock goes from $6 to $1,900 to the ton. I send herewith a sample of gold from our placer diggings. The sample is from five pans of dirt. (We judge there is about $2 worth of it.—*Ed. Union.*)

Bull Run.—Elko *Independent*, July 28th: We saw some big chunks of ore from Bull Run district Saturday that fairly made our mouth water. It was not "here a little and there a little," but rich all through it. The ore was from the Porter lode. 3,800 pounds are being taken to Dall's mill, in Washoe, to be worked.

The White Pine *News* of July 30th says of Bull Run ore: "Three assays shown us figure as follows: From the Fairview ledge, $467.53; two other assays from one other ledge, $4,216.20 and $4,415.19. There are at present 25 men in Bull Run and 60 in Cope district.

ESMERALDA.

Aurora.—Cor. of Sacramento *Union*, July 25th: Placer mines have been discovered about eight miles from Palmette, which the miners are working with fair success. Kernohan & Co. cleaned up their arastras at Bodie last week, and after a run upon 50 tons of rock they have realized 404 ounces retorted amalgam, valued at $13 per ounce, and $30 per ton of rock worked. As the arastras are worked by water power, the cost of carting and working the rock is less than $6 per ton.

REESE RIVER.

New District.—*Reveille*, July 31st: Another rich district has been added to Lander county. It is situated a little south of east of Austin, and distant about 65 miles,

and is only 16 miles southwesterly from Eureka district. It has been named the Spring Valley district. Mr. Murray showed us certificates of assays from the mines located by the company, which were up in the hundreds, and informed us that several wagon loads of ore were on their way here to be worked at the Manhattan mill. Mayor Frost corroborates Mr. Murray's statements in regard to the richness of the new mines.

Mineral Hill.—The news from Mineral Hill this week is meager. Mr. Ward brought in another batch of ore, some four tons, we believe, which were worked at the Manhattan mill, and yielded $440 per ton, which will do very well for top rock.

Prospecting.—Everybody has gone prospecting. The Mayor and two members of the Common Council are out, two of the three County Commissioners are out, one of our two Justices of the Peace is out, and we would not be a whit surprised to see the District Court adjourn and bolt out of town with the rest. Some discoveries made within a few miles of Mineral Hill have turned everybody's heads. Seriously speaking, there appears to be a rich discovery made in the mountains six miles south of Mineral Hill. Surveyor General Davis, who was at the latter place, heard that rich ore had been found in that direction, and he dispatched Q. Riho to explore the locality. Riho was successful, and struck an immense vein, which assays high.

The Manhattan, Lane & Fuller, Troy and Plymouth Co's now use the Giant powder. The Twin River and the Buckeye will do so shortly.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

Crown Point.—Gold Hill *News*, July 30th: In the drift east from the shaft, at the 1,100-foot level of the Crown Point mine, a very heavy stream of water was struck night before last, 200 feet from the shaft, which increased rapidly, calling for all the pumping and hailing resources of the works to keep it down. It had raised, however, by midnight last night two or three feet above the 1,100-foot station. This new strike drains the 1,000-foot level above completely.

Bullion.—Yesterday's shipment of bullion from Virginia was as follows: By Wells, Fargo & Co., 16 bars, worth $33,336.27; by the Pacific Union Express, $8,237; total, $41,336.27.

Yellow Jacket.—Same of 31st: This mine is yielding about 200 tons of ore per day, from the 800 and 900-foot levels of the south mine, and the old Yolo tunnel. It will take four or five weeks yet to complete the repairs to the shaft between the 600 and 700-foot levels. This work, however, is not allowed to interfere with the working of the mine.

Crown Point.—Nothing new at the 1,000-foot level. No ore comes from it. Last Thursday night a very heavy body of water was struck at the 1,100-foot level shaft, which continued to increase despite all pumping; but yesterday it began to decrease.

Belcher.—Things look promising at all points, especially east of the 337-foot level, where several "rises" have developed good bodies of pay ore.

Justice-Independent.—Some promising developments are being made from the 200-foot level up. An assessment of $5 per share was levied last Saturday.

Sierra Nevada.—The second clean up for the month is being made to-day, and bids fair to come up to the average. The body of pay ore at the surface increases in extent.

Imperial-Empire.—The usual amount of ore from the upper levels. The clutch of one of the hoisting reels broke last Wednesday, which had the effect to suspend repairs and allow the water to rise considerably.

Chollar-Potosi.—During the week ending Friday, 1,350 tons were yielded by this mine, the assays averaging $67; the bullion shipment was $19,892. The mills are running up to their utmost capacity.

Gould & Curry.—Drifting east through the ledge, from the seventh station, is progressing admirably, being now over ten feet from the shaft. The old upper workings yield 45 tons a day, averaging $50.

Kentuck.—The opening out of the lower part of the mine, beneath the fire, through the 900-foot level of the Yellow Jacket mine, is progressing favorably.

Ophir.—West drift at the 700-foot level, 480 feet from the new shaft. Some rather more encouraging indications have been met with of late.

Hale & Norcross.—Yielding a little over 100 tons per day, principally from the fourth station level. The 175-foot level is also yielding a fair quantity and quality of ore.

Virginia Consolidated.—New shaft nearly 200 feet below the surface, and the work progressing at a very satisfactory rate.

Going Yet.—*Enterprise*, July 31st: The fire in the mines at Gold Hill is supposed to be burning still. It is confined within certain bounds, and will doubtless burn in a smouldering way as long as an unconsumed timber is left in the levels in which the fire is situated.

WHITE PINE.

The Strike—Bullion.—*News*, July 31st: "The suspension of operations by a few mines last week has been followed this by a number, and our bullion shipment has fallen to $40,861.77. The strike and the action of the strikers has caused this. Of this state of affairs the entire community outside the league has become heartily sick, more especially the great mass of miners themselves. Those who are disposed to work have now formed an organization for mutual protection. The plain truth is, the patience of this community is well nigh exhausted, and a single act of violence would exasperate the public mind to such a degree that punishment would not stop short of exhaustive vengeance. We are not writing idle words. Many of the mines will start up on Monday, full-handed in more senses than one. The men (about 113) in the Consolidated Chloride Flat Company will continue work at the reduction. The Nevada and Summit mines and the Auroro Consolidated will also start up at $4. The Mazeppa and others have already started, and are abundantly able to defend their rights. The Eberhardt people say that not another pick shall ever be struck in the Eberhardt mine at a rate higher than $4 per day to the man; they have stood the brunt of battle, borne the curses, and now they propose to see others moving along smoothly with the new order of things before they make another move.

There is already a considerable number of men working in the mines at $4 per day, and many others (nearly five-sixths of all in the district) will commence on Monday—and they will continue to do so. The officers of the law are fully prepared for any emergency, and the community is more than willing to enforce obedience to the law."

The effect of this firm stand was all that could be wished. Everything is quiet, all are at work, and regular wages at White Pine is now four dollars per day.

Items.—*News*, 29th: Eastern Slope Tunnel resumed operations yesterday. The tunnel is in 230 feet.....29th: Shaft in the Keil. Sheridan has struck ore at six feet. ....Seven feet more of blasting will connect the new drift in the John Dare with the old shaft.....Work was yesterday commenced on the McKean and Eldred mine, Mahogany Cañon, and a shaft will be sunk to the depth of 25 feet.....National tunnel is in 120 feet.....30th: Yesterday the Colfax claim changed owners at $12,000..... *Empire*, 27th: Assays from the chloride in the bottom of the Ravell shaft gave $800 to $1,000 per ton.....30th: Rich rock struck day before yesterday in the northern works of the Virginia mine.....The Buttercup mine on Blue Hill was purchased yesterday for a company of New York capitalists..... *Telegram*, 27th: We saw yesterday at Wells, Fargo & Co's, the first bar of bullion from the Logan & Lowis mill, at Swansea. It was the product of one ton of ore from a Treasure Hill mine, and valued at $350.....The Virginia ships ten tons of ore to mill daily.....In grading a place for a draft furnace at the Mazeppa mine, the workmen struck very rich chloride.....30th: Three bars from Earl rock yesterday, valued at $500..... 31st: We understand that the Aurora Consolidated Co., since their late defeat in Court by the Earl Silver Mining Co., have purchased a number of other claims in the vicinity of the Earl, and have commenced suit against the owners of the Earl mine, and attached all the ore on the dumps and at the mills, as well as some $15,000 worth of bullion.

Mills and Smelting Works.—*News*, 29th: Notwithstanding the obscure rumors afloat, the White Pine Smelting Co. was never in a more flourishing condition than at this moment. We were allowed yesterday to inspect the machinery. The engine was fired yesterday for the first time, with a view of producing results, and the blast works admirably. We were shown eight pigs of argentiferous lead, each weighing 100 pounds, ready for shipment, this being the result of only six hours' work. The present reducing capacity of the works is about six tons per day. We understand another large furnace and a 10-stamp mill are very shortly to be erected.

All the material for Stanford's new 30-stamp mill, about 800,000 pounds has arrived on the ground. The water can not be hoisted by hand from the bottom of the shaft as fast as it gushes up from the artesian, and workmen will proceed Monday to put the steam engines in order, to relieve the shaft so that boring can be continued.

Outside Districts.—*Empire*, 31st: Rock from the Josephine and Oriental mines, in Kern District, assayed $87. The Reporter went $100. The America, $139—by another assayer, $169..... *Telegram*, 30th: A specimen of ore from the Knowlton lode in Shoshone District was given us. Heated in a forge, its surface was covered with glittering globules of silver. The ledge is five feet in width, and well defined. The rock is easily milled. Following are some of the assays: No. 1, from the Knowlton ledge, $524.67; No. 2, from the Ben. Evans ledge, $307.85; No. 3, from the North America, $587.49; No. 4, from the Gettyshurg ledge, $219.91. These assays were obtained from averaged selections.... Same of 29th: Mr. J. A. Carter informs us that a Mr. Flowers and himself lately struck a fine ledge in Patterson District. It is located on the high mountains above Montezuma, above the Washington mine, and is fully 18 inches in thickness..... Potter & Hall have returned from the Spring Valley District. The Mayott ledge will average eight feet in thickness. Assays as high as $5,000 to the ton have been procured from it. The Providence ledge is 40 feet wide.

New Mexico.

Items.—Santa Fe *Gazette*, July 27th: We learn that the New Mexico Mining Co. will have their twenty-stamp mill ready in a few days. A new and rich lead has been discovered by the company.....The new placers continue to do a prosperous business. Gov. Mitchell has arrived and brought with him the result of another clean up of the 10-stamp mill, which amounts to $1,000 in gold.

Oregon.

The Excelsior Mine.—The *Oregonian* of July 24th contains the report of Dr. Veatch on this mine, which is situated in Bohemia District. We clip from it the following: "Out of ten assays from as many different samples, I found but one to fall so low as $8 per ton, while four reached an average of $2,000, the remaining five ranged from $5 to $250 per ton. The samples were chosen with a view to an impartial selection; but it cannot be supposed rationally that the above results could be sustained by a practical working test, on a large scale. There are good grounds for believing that large masses of the rock will yield $30 per ton, taken without selection. The quantity of workable rock from appearance is practically inexhaustible."

Utah.

The Seveir Mines.—The following notes are from the Shermantown *Telegram*, of July 26th: "These mines are situated within a few miles of Seveir River, about 180 miles almost directly south of Salt Lake City. They have for some time attracted the attention of miners, although they have created no extraordinary excitement. Many of the ledges have been traced for miles by the croppings, and contain mostly silver in connection with a little gold. The tests of their richness by mill process have been as yet limited. By assays the ore has shown a yield varying from $50 to $14,000 per ton. The mines are said to be easy of access, immense in size, with an abundant supply of wood and water. The population of the district is about 150—mostly Gentiles."

The White Pine *News* says that two miners have left Treasure City "for the rich placers and quartz gold diggings near the head of the Seveir River, Juab County, Utah. The placer diggings there have been known to exist and have been worked by the Mormons for more than a year, but not until recently was rich auriferous quartz found in the mountains some distance above the river and gulch workings."

The German Mails from China, Japan, etc., are to be hereafter forwarded *via* this city over the Pacific Railroad. Correspondence between the North German Confederation and our own Government is now in progress which will undoubtedly lead to such an arrangement. By this mode of transmission a saving of ten days will be effected between Hongkong and Germany.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

The following is a revised list of books interesting to our more special readers. The newest and most complete treatises on subjects within the scope of this paper, including local maps, pamphlets of value, etc., will be added from time to time:

ABBOTT, GORHAM D.—Mexico and the United States: Their Mutual Relations and Common Interests..... 2 00

ANTISELL.—The Manufacture of Photogenic or Hydro-Carbon Oils, from Coal and other Bituminous Substances, capable of supplying Burning Fluids. By Thomas Antisell, M. D. 1 vol. 8vo.. 3 00

BANCROFT'S Guide for the Pacific States..... 50

BARSTOW—Sulphurets; What they are, How Concentrated, How Assayed, and How Worked; With a Chapter on the Blow-pipe Assay of Minerals: 1 vol. 12mo. cloth..... 1 00

BLAKE, W. P.—Annotated Catalogue of California Minerals. 8vo..... 50

BLAKE, (W. P.)—Report on the Precious Metals at the Paris Ex., 1869. (To be had through Members of Congress.)

BRACE, C. L.—The New West..... 1 50

BROWNE, ROSS—Mineral Resources of the Pacific States. San Francisco, 1868..... 4 00

BOURNE (John)—Handbook of the Steam Engine, Illustrated. 2 vol. 12mo, cloth..... 2 25

CADWALADER'S Map and Description of White Pine. San Francisco, 1869..... 1 50

COTTA, B.—Lithology. London, 1867..... 3 00

CONGDON.—Mining Laws and Forms of California and Nevada, and the Mining Ordinances of Mexico. 181 pp. 8vo; flexible cloth; 1864..... 2 50

CROOKS & ROHRIG'S Translation of Kerl's Metallurgy (not yet received here in full)....

CRONISE (W. H. V.)—Natural Wealth of California..... 6 00

DANA'S Manual of Geology. Numerous Illustrations. 8vo. half morocco. Philadelphia, 1867. 6 75

DANA'S Text-Book of Geology. Illustrated. 12mo, cloth. Philadelphia. (School Edition) 1861... 2 25

DANA'S System of Mineralogy. New Edition. 8vo. cloth..... 10 00

DANA'S Manual of Mineralogy. Revised edition, 1868..... 10 00

ELDERHORST'S Blowpipe.—Analysis and Determinative Mineralogy. Third edition, revised. 8vo. cloth. Philadelphia, 1865..... 2 50

EVANS—White Pine..... 25

FREY & WELL'S Topographical Railroad and County Map of California and Nevada.. 1 50

FEUCHTWANGER — Treatise on Gems..... 6 00

GOODYEAR'S Translation. A Treatise on the Assaying of Copper, Silver, Lead, Gold and Mercury, from the German of Th. Bodeman and Bruno Kerl. 1 vol. 12mo. cloth..... 2 50

HITTEL'S (JOHN S.)—Resources of California; comprising Agriculture, Mining, Geography, Climate, Commerce, etc., etc; the Past and Future Development of the State. 12m.. cloth. 1 50

HOSKOLD'S Practical Treatise on Mining Land and Railway Surveying, Engineering, Etc. 1 vol. 8vo. cloth..... 16 00

KUSTEL.—Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada; also, a description of the General Metallurgy of Silver Ores. By Guido Kustel, Mining Engineer. Illustrated by accurate engraving. 1 vol. 8vo cloth..... 6 00

KUSTEL.—A Treatise on Concentration of all Kinds of Ores: including the Chlorination Process for Gold bearing Sulphurets, Arseniurets, and Gold and Silver Ores Generally. By Guido Kustel, Mining Engineer and Metallurgist. Illustrated with 120 diagrams on 7 plates. 1 vol. 8vo. cloth..... 7 50

LAMBORN.—Rudimental Treatise on the Metallurgy of Copper. 1 vol. 12mo. limp cloth. Illustrated..... 1 00

MITCHELL'S Manual of Practical Assaying. 1 vol. 8vo. cloth..... 10 50

MAKINS.—A Manual of Metallurgy, more particularly of the Precious Metals, including the Methods of Assaying them. By G. H. Makins. 1 vol. 12mo. cloth. Illustrated by upwards of 50 engravings..... 3 50

MAPS—Of Oregon, Idaho, Mexico, White Pine, etc., can be had at Bancroft's and Genoud's.

OVERMAN (Frederick).—A Treatise on Metallurgy; comprising Mining, and General and Particular Metallurgical Operations. 1 vol. 8vo. cloth. 7 50

PHILLIPS (J. ARTHUR) — Mining and Metallurgy of Gold and Silver. New edition.) 8vo. Cloth..... 15 00

PERCY (John).—Metallurgy; the Art of Extracting Metals from their Ores, and adapting them to various Purposes of Manufacture. Iron and Steel. 1 vol. 8vo. cloth..... 13 50

PLYMPTON—Practical Use of Blowpipe. 1863..... 2 00

Practical Use of the Blowpipe; being a Graduated Course of Analysis. 12mo. cloth. New York, 1858..... 2 00

SCOFFERN'S Useful Metals and their Alloys. 1 vol. cloth..... 5 50

SIMONIN, L.—Underground Life; or, Mines and Miners. Edited by H. W. Barstow, F. R. S. 160 wood engravings, 20 maps (colored), and 10 plates of metals and minerals in chromo-lithography..... 18 00

SIMONIN, L.—Underground Life, or Mines and Miners..... 18 00

Notices to Correspondents.

B. Y., Santa Cruz.—According to a work recently published by Mr. Poulett Scrope on the subject of volcanoes, he observes that the two spots of the earth on which volcanic fires are most active at the present day are the wreath of islands around Borneo in the Pacific, and the circuit of the Caribbean Sea,—the two being exactly antipodal to each other.

Naturalist, Oakland.—When it is necessary to preserve animals or parts of animals in spirits, it is most desirable that they should be kept in dark closets, with opaque fronts, in cool rooms; otherwise the effects of light will be soon found to deprive the specimens attempted to be preserved, of their natural color, while light and warmth combine to cause the rapid evaporation and consequent loss of alcohol, both as respects strength and quantity.

Gobbler, Martinez.—The domestic turkey is now generally supposed to have descended from a Mexican variety, and not from the wild turkey of the Northern States. An able article on this subject will be found in one of the later volumes of the Patent Office Reports on agricultural subjects.

Hippophagus.—The flesh of worn-out horses may not be unwholesome, but certainly forms inferior animal food for the miserable classes compelled by want of ability to procure better to consume such, tempted by its low price. Attempts to fatten horses for human food have resulted in showing that the same amount can be obtained much more cheaply through the agency of oxen and sheep.

W. K. L., Los Angeles.—Arboriculture as a whole, and particularly in special departments, will at no distant day be deemed in California as equally important and even more profitable than viniculture. In no way can a man of small means so easily transmit certain wealth to his grandchildren as by planting suitable trees in such portions of his property as are not adapted to general cultivation. On this subject the old Scotch laird's advice to his children when on his death-bed may be advantageously reflected on: "Lads, be aye sticking a tree in, for it will be growing while ye are sleeping."

Invalid.—Lithium is the lightest metal known. As a carbonate, for some time it has been used medicinally in gout and rheumatism, and more recently as a bromide, especially when the neck and throat are effected. Bromine, in various compound forms, has lately been employed as a medicinal agent. The bromide of zinc has been found to relieve nervous power, and the bromide of lead has been recommended as a cool local agent in inflamed states of the mucous membrane.

Worthy of Consideration—Metallurgical Premiums.

From several sources worthy of high regard the suggestion is made to us that premiums should be offered by the Government for the advancement of practical metallurgy in our mineral regions west of the Rocky Mountains. The Sacramento *Union* has pointed out, with the aid of figures undeniable, the advantages that would accrue to iron manufacture somewhere in the interior—say at Salt Lake, or on the slopes of the Sierra Nevada—for railroad iron alone. Premiums operate very efficiently in favor of first beginnings; and it is not improbable that with the existing local demands for iron, even a moderate premium would call into existence so important an industry as iron production. California has offered a premium of this kind, which applies to iron deposits adjacent.

Of still greater practical bearing and of more general interest is the subject of working our ores. Light is needed, such as can be obtained only from tests of practice, as to the best methods for beneficiating certain ores. By offering a premium for the best process of working pyritiferous gold ores containing zinc blende for example, a cloud of difficulty would at once be swept away, that hangs at present over entire districts of richly-assaying gold veins that are lying unworked for no adequate reason in the world. Let there be a premium for the best method of working gold ores containing galena, or fahl ores,—which abound and are dead property, though rich, merely because the metal will not separate itself to unskilled hands that seek to tempt it out with quicksilver. Let there be a premium for the best method of saving float gold. For working silver ores, sulphurets, and carbonates or antimonides, or fahl ores, might be specified, with or without lead and copper of a certain percentage. The "working-up of a process" adapted to particular ores, and localities or conditions, is an undertaking of no small labor and expense; yet the moment that the truth has been demonstrated, the moment that the principles of metallurgy have been applied to economical questions bearing on the issue of prosperous mining, the results become general property, and the benefactor of the public, if he be liberal, is out of pocket for his pains. If Legislatures—the men who are to represent the interests of the public—can afford to be public-spirited in a land of grab-law, such as is developed by our mining excitement antecedents, here is one of the best opportunities that can be conceived of to benefit the interest which was the fore-runner of all our prosperity and of our very existence,—the interest that has built our cities, our mountain roads, the Panama Railroad, and the Pacific Railroad; yet that which has been called, with bitter depreciation, "our paralyzed member."

The generation of public leading men of the Pacific Coast who are broad, liberal, far-seeing and public-spirited, has not yet developed itself, or has not asserted its rightful prerogative to give direction to public affairs. We are yet a small people, provincialists, revolving around petty orbs of a golden glimmer, around which are many rings; forgetting the glorious freedom that we learned in "early days," and to a degree oblivious of the grander national and commercial interests and relations that will one day elevate California to a significance and importance far more real, in the civilized world, than we have yet attained.

So small a thing as the invention of the Pattinson process in our fathers' days, for the desilverization of lead, had the effect to reopen mines in many countries, employing tens of thousands of people, and keep them open prosperously to this day, which had been lying unworked for centuries. A trifle affecting the out-bringing in a mining district makes all the difference between paying and languishing.

Mining is not our "paralyzed interest"; but successful mining, in all but that kind which in older districts is called robbing of the earth, demands intelligence and an undaunted study of all the practical and theoretical points involved. Whether the State be wise or stupid in its policy of fostering and cultivating this root of its prosperity, certain it is that mining and metallurgy will, in the long run, take care of themselves.

Another Test of Barlow's Anchor.

A more thorough and practical test of the anchor recently invented by Mr. E. T. Barlow, of this city, was made on Thursday last, in an open field at the junction of Folsom and Fifteenth streets. Our readers will recollect the mention we have made of previous trials of this anchor, at the Mare Island Navy Yard, and in this harbor; both being from on ship-board. The trial, on Thursday, was made on land and intended to be concise in character. This anchor, weighing 595 pounds, was placed upon the ground about one hundred and fifty feet from an anchor of the common form, weighing 900 pounds. A six-ply rigging was run through two blocks, with each end of the running part applied to a winch, midway between the two anchors, thus drawing equally from each direction. Each block being connected with its respective anchor, the strain, when the power was applied to the winch, of course came upon both anchors alike; hence, if the holding capacity of one was greater than that of the other, the weaker one must necessarily approach the winch nearer than its opposite.

In this trial eight men were placed at the winch; at the first test the Barlow anchor was dragged five feet, while its opposite moved eleven. The anchors were then reversed—the Barlow being placed upon the ground previously occupied by the common anchor; when, upon a second strain being applied, the Barlow dragged but two feet against seven for the other. The strain put upon the anchors was as great as could be brought to bear upon a ship of 400 tons, under any ordinary circumstances of severe weather.

The trial was pronounced fair and most satisfactory, and resulted in a complete triumph of the Barlow, over a common anchor of almost double its weight. The test moreover showed the utter impossibility of the Barlow anchor ever becoming fouled by the chain. During the trial a slight mechanical defect was noticed in this anchor—a winding, which caused it to fail of the full efficiency due to a perfect piece of work, and which was overlooked in its manufacture. Had it not been for this circumstance the test would have been even more in its favor. This defect in no way affects the principle of its construction, and can be readily removed at the forge. We are pleased to record this new and additional evidence of the value of this invention. The ground where this trial took place may be seen at any time, and the distances measured, as confirmatory of the above report.

Memorial to Faraday.—On June 21st, a meeting was held at the Royal Institution for the purpose of paying homage to the memory of Faraday. Mr. Dumas, the eminent French chemist, of whose address on the occasion of the opening of the Faraday lectures a few days previous we speak elsewhere in the present sheet, was present, and made appropriate remarks. The meeting voted to erect a public memorial,—to be decided on by a joint committee of scientific men.

The Round Table.—This journal is now merged in the New York *Citizen*, which will assume the style of the old *Round Table* at the end of its present volume, and will consist of twenty-four pages.

An American System of Mining.

In this idea, as presented to the Academy of Sciences by Mr. Raymond, U. S. Mining Commissioner, there is something progressive and quite to the point.

As Americans, up to this, time we have never assumed to claim any of our systems as *par excellent*, giving to other nations the credit of more wisdom and experience in mining than we possessed, and we may say properly, too; but we are now becoming experienced, and are working up new and effective systems of our own, based on science, and what is as clearly reliable—practice; systems which, for perfectness and cheapness, have proved the strongest and most desirable.

The pan silver process of Washoe, though at first considered unscientific, in the sense of chemical affinity, has proven itself strictly so, and more profitable, consequently more valuable than either the Freiberg, Patio or other processes of European or Mexican origin, against which it battled for supremacy. This is purely an american system, and has become quite popular elsewhere, as well as in Washoe.

To improve the Knox pan, as first introduced, there have been innumerable new inventions, to enumerate which would be quite a task; but the most prominent of which, are the Varney, Wheeler & Hepburn pans, none however presenting anything new, in point of chemical operations, but each varied in a mechanical sense.

On the other hand, we have those who are ostracizing the iron pan working, and paying no respect to past systems, usages or ideas; but who are plowing up new ground in the broad fields of electric, chemical and mechanical science, and who may yet present a system superior to all; having strong claims in both a scientific and practical sense. Step by step we are certainly moving up to a more superior system of working. One fact which inspires us with some confidence in this respect, is the remarkable success that has attended experiments upon the several systems. Who will carry off the palm of introducing what will be generally accepted as the "American System"—which must embrace the greatest economy with perfectness of working economy both as respects machinery and manipulation,—we will not pretend even to conjecture. It is the battle of a few ardent workers for the favors of the multitude, who have no greater appreciation, though we are sorry to say it, than the benefit it will be to them in gold and silver.

That there should be some plan adopted, either by State or National government, whereby statistics can be gathered and made available and profitable to all, is evident to every experimenter, inventor or millman, who thinks and desires to acquire information of the progress of his pursuit, as well as those who desire it in the sense of science, or as a question of political economy. The Pacific States are the mining States of the Union; and it is for them to devise a plan, which at the least expense may bring about that order of things for the mining interest, which shall prove the greatest good to the greatest number. To this end we shall earnestly look for suggestions.

In these progressive times we must not, in our conceit, be content with what we have, only, and what we are doing, individually, but reach out for something better, if it can be had, for individual as well as the general good.

Another Flying Machine.—A mechanical genius at Windsor, Sonoma County, has invented a flying machine. He calculates that an operative machine can be built for a small sum which will "fly like a bird" and beat the "late velocipede."

More Snow Sheds.—The Pacific Railroad Company is increasing the extent of their snow sheds. Their success has been fully tested during the two past winters.

Sheffield Scientific School. — We have received the programme of exercises at "Commencement," July 19th, at the above named institution. We are reminded hy it that "the world moves." The contrast hetween the subjects choseu for *theses* hy the graduating class, and those which we used to read upon the old-timo commencement programmes, is striking enough. How much more "practical," and more likely to he of use in our day and generation, is an elsborato paper npon "Sewers," than one upon the "Character of Socrates"! "The Utilization of power in Machinery"; "Fonndations in water for Bridges"; "Natural intermittent springs"; "The wster supply of citics"; "The gold placers of California"; "The silver region of Colorado":—these also are titles which we note among those upon this programme. The fresh and vigorous young intellect of our country finds delight in grappling with thoso problems the solution of which will soonest ameliorato the condition of the race. Classical students are voted old fogies, and classical stndies musty. For our own part, we go for the reform,—within certain limits;—although wo wonld by no means altogether ignore the classics, lest the peculiar philological training which they alone can give, be neglected, and the student consequently fail to acquire that felicitous exactness in communicating his ideas to others, which ao greatly enhances their "telling" valuo.

White Pine Miners' League—Violence. Since our mining snmmary went to press, Treasure City telegrams announce that further demonstrations have heen made hy the Miners' Union. The dispatch of the 4th, says that night ahifts working for $4 were driven out of the shafts. Shots were fired in one instance. The President of the Union and several other members were arrested next morning and sent to jail. Another telegram on the 5th is as follows: There are no demonstrations to-night hy the Miners' Union. The lock-up and mines are strongly guarded, and a full force are working the mines. A numher of the Miners' Unionists left the district yesterday. Nine of them were arrested yesterday, and will he tried soon.

A meeting of citizens is called to-night to devise means to protect the property of citizena and insure peace. There are rnmors of threats to burn the city.

A Wail from Nevada City.—The *Gazette* mourna the folly of the Atlantic touriats who are visiting California this season, but fail to call at the "huh," where the gold comes from that keepa the Government in motion. It says that after seeing nothing else except this city, "they will probahly return to the East and recount to the wondering thousands the magnificent fruit *raised in San Francisco* that they saw displayed in Washington Market, and what quantities of gold dust arrived at the Mint daily, taken from the sand hills around the city."

We can only suggest, hy way of consolation to our friends in that county—get a railroad.

Illustrated San Francisco News.—This journal fulfills, so far as we have seen, the promises contained in its prospectus. The especial feature is its style of illustration. We rather like the zincograph. The effects which are producible by its means are really surprising. The manager of this department in the publication in question, is unmistakahly a genuine artist. We hope that the enterprise will he a success.

Union Hotel.—Our agent, who has traveled enough to know "what's what," makes special mention of the above named house in Nevada City. It has been kept well and long by Messrs. Eaton & Williamson, proprictors.

An Improved Plane.

In practical mechanics, wood is fast becoming superseded by iron. Tools, especially, which require to be accurate, and that are exposed to much wear, are now made of iron or steel. Planes form about tho only exception. They are still made of wood. It is surprising that it is so, when we cousider the severo and nice mechanical service to which they are applied. They should he at all times accurate and durable; hut all admit that wooden planes are rarely true, and, if made so, qnickly wear or spring out of shape. Why, then, are they so generally nsed? Simply hecanse iron planes, of proper construction and cost, could not be had. The iron planes made and used in England, and to some extent here, work perfectly, hut their cost is three times, and their weight more than twice that of our wooden planes; and like all iron planes heretofore made, they "stick" to tho wood, and require a greatly increased power to move them. This prevents their general nse. This adhesion is dne to their nearly perfect faces,—for, if entirely perfect, and placed upon a surface of wood equally so, they would adhere to it with a forco equivalent to fifteen pounds on every square inch of contact. Practically, however, the difference is as ahove stated. To overcome this adhesion, the plane herewith figured is fluted or grooved upon its face, parallel

to its length, hy which the increased friction and the atmospheric pressure are at once removed, while the exactness of the working face is still maintained. The next objection, that of weight, is overcome hy the construction of this plane allowing it to he made of the same weight as the average of wooden planes of the aame kind. The cost is less than half that of the English make, while none of the excellonciea of those planes are overlooked. This is effected hy the perfect machinery employed in the manufacture of its different parts.

This plane is readily adjustahle hy ingeniously devised joints, levers, knobs, etc., hy which the hit is removed or fastened, the cut regulated, the edge aquared, the throat adjusted, and the cap placed. All these changes are made almost instantaneously, and with far greater precision thau can he done with the ordinary wooden planc. The accompauying figure conveys a very good idea of the general appearance and construction of this improved tool, which is now, for the first time, introduced into this State, and may he seen at the store of H. T. Graves, 412 Clay street.

Earthquakes in the Southwest.—Tho Valley of the Mississippi is hecoming almost quite as "shaky" as the region of country hereabouts. It will be recollected that the citizens of St. Louia were very much alarmed at two o'clock on the morning of the 2d instant hy an earthquake shock, which aroused most of the residents of that city from their midnight slumhers. Seven distinct shocks were felt ahout the aame time at Memphis, two of which were quite severe. The shocks were felt over a region of country of several hundreds of miles in extent—full as great as that effected by the great shock in this State last October.

Another severe ahock was felt at St. Louis on Monday morning of last week.

A Specimen.—J. M. Buffington, Secretary of the Alleghany Consolidated G. M. Co., Sierra county, Cal., has ahown us a quartz *chispa*, as big as a double fist, estimated by specific gravity to contain 6.65 ounces of gold, worth about $118.22. This mine evidently prospects well, although we are not assured that such specimens are to be found every day.

Steam Joint Packing.

Messrs. A. H. Hall and H. T. Lee, of Marysville, hold a recent patent for what they consider an improved metal packing for stationary joints in steam engines and steam and water pipes, a small illustration of which wo givo herewith.

The packing is made of malleahle metal. Fig. 1 represents a section such as would apply to the corner of a steam chest. The holts whioh hold the cover of the steam chest pass through the holes represented in the packing, thereby holding the packing in its place. In drawing the joints together, the pressure comes upon the rim of the packing only, and it is easy to see that it is thereby more certain and ready to fit itself to the inequalities of the surface than if the packing was flat. Fig. 2 shows the circular form of packing for pipes.

The proprietors claim that by this device joints are made perfectly tight, hoth inside and out, and that hy thus perfectly closing the inside of the joints of the steam chest of an engine, the steam cannot cut away the inner edges of the joints; so the chest will last as long as any other portion of the engine. The joints may he opened and closed as often as required without injury to the packing, or decreasing its efficiency. Also, that the packing will not he forced out of place hy pressure, and when properly made aud applied it is permanent.

It is certainly a very simple device. In their advertisement the proprietors refer, hy permission, to well known engineers for practical information.

Silver in New Hampshire.—The old lead and silver mine at Madison, N. H., long ago discovered and recorded iu Dr. Jackson's survey of the geology and mineralogy of the State, has heen lately re-opened. "The Chocorua Silver Lead Co." are employing ahout thirty workmen, and have got out 1,500 tons of ore. Fifty per cent. of this is metal—silver, lead and zinc. The company crush the ore and separate the metal. The lead holds silver at the rate of from sixty to ninety ouncea a ton; and is sold to a reducing company in New York at from $150 to $250 per ton. According to this, each ton of ore aa it comes from the mountain is worth over $75 iu lead and silver. The mine is worked to a depth of sixty feet.

The Mormon Schism.—Two of Joe Smith's sons nave arrived in Salt Lake City. It is helieved that there will he trouble in the camp. One of these young men, David, is not ouly a good speaker, and of agreeable address, hut he is withal fully possessed with the belief that his older brother, Joseph, now living in Illinois, is the rightful head of the church, and that Young is an interloper. Moreover, he is a hater of polygamy, and is looked up to, hy some 15,000 dissenters in the western country, as the man who is destined to "deliver them from hondage." The "Destroying Angels" will have to silence this handsome young fellow, and that soon,—or the hoary Brigham will find himself all at once "in the vocative."

The Eclipse To-day.—Be ready with your smoked glass at 1.28 P. M. The obscuration is only partial for San Franciscans, the line of total eclipse being north of us, and extending southeasterly from a point in Alaska, in latitude 61° 46′ N., longitude 68° 4′ W. (of Washington),—where the eclipse will he total at noon,—through the southern part of Minnesota, toward the Atlantic at Newbern, North Carolina. We have given the programme more fully in a previous issue.

New Books.

A Treatise on Rope-Making, as Practiced in Private and Public Rope-Yards, with a description of the manufacture, rules, tables of weights, etc.; adapted to the trade, shipping, mining, railways, builders, etc, By Robert Chapman, formerly foreman to Messrs. Huddart & Co., Limehouse; and master ropemaker of H. M. dockyard, Deptford. Revised edition. Philadelphia: Henry Carey Baird. 1869.

The author of this book speaks of matters with which he is acquainted; having, as he says, been employed in all the hranches of the husiness as ropemaker, sailor, and rigger, for many years. The whole matter is rednced to fignres, and the working rules and tahles are numerous and full. For sale by A. Roman & Co. Price $1.50.

The Painter, Gilder, and Varnisher's Companion; containing rules and regulations in everything relating to the arts of painting, gilding, varnishing, glass-staining, graining, marbling, sign-writing, gilding on glass, and coach painting and varnishing; tests for the detection of adulterations in oils, colors, etc.; and a statement of the diseases to which painters are peculiarly liable, with the remedies. Thirteenth edition—revised, with an appendix etc. Philadelphia: Henry Carey Baird. 1869.

The number speaks for the popnlarity of the former editions of this hook; and the very full appendix, which the present one contains, hy no means detracts from its merits. The "principles of harmony and contrasts of colors" is a most interesting snhject; and Chevreul's treatment of it forms a part of that appendix. No painter, in these days of competition for the favor of an appreciative public should he without this hook. For sale by A. Roman & Co. Price $1.50.

The "Alta" on Earthquakes.

Some two or three years since, the *Alta* gave an elahorate exposition of its "views" upon this snbject; and enunciated a theory of its own, which it took pains to declare was the result of long and careful thonght. It does not seem, however, to have heen very generally adopted hy the scientists of the day. We may say, in fact, that we have never heard of it aince. But a recent article in *Blackwood's Magazine*, the object of which was to show that "these convnlsions are due to distnrbances in the crust of the earth, occasioned hy electric action," etc., has brought out the *Alta* again. After giving several quotations from the article aforesaid, it complacently winds up thus:

"We may remark, in closing, that the writer in "Blackwood" is aomewhat mistaken in putting forth hia viewa npon earthquakes as a "new theory" on that auhject. The idea that earthqnakes were due to electrical derangement, rather than to internal convulsions, was presented years ago in the columns of the *Alta*. The only difference hetween these two theorica is, that while the writer in "Blackwood" holds that the outer rim, or crnst of the earth is shaken hy these disturhances, the views presented in these columns, though admitting fissures and rents in the aurface, were to the effect that the commotion is principally confined to the structurea upon it."

"The only difference" is good. According to one of the "two theories,"—as the *Alta* itself virtually says ahove,—in an earthquake, the earth moves, and according to the other it doesn't. That's all.

Title to the Idaho Mine, Grass Valley.—The *Union* gives Commissioner Wilson's decision in regard to this claim. It is the first extension of the Eureka; and its application for a patent was objected to by the Schofield Company. "It is decided that a pstent should issue to the Idaho Co. for their claim of 3,100 linear feet along the Eureka lode, as applied for."

Moore's Flat Destroyed.—On the last day of July, the husiness part of this town was entirely destroyed by fire. The loss is about $75,000,—half of which is covered hy insurance. Most of the dwelling honses escaped. The mines in the neighborhood are paying well, and enough of the business houses to serve the purpose will he rebuilt.

Those 300 mahogany logs received from Central America by Hobbs, Gilmore & Co., are finding a ready sale. ***

Moving Machinery Photographed.—M. Bourbouze, in explaining the gas machine of M. Hugon, experienced difficulties not anticipated, while demonstrating the relative movements of the slide and pistons; and was obliged to repeat several times the same design, with the organs in different positions, with only partial success. In studying to remedy this defect, he has succeeded. He constructs his photographs in movable parts. By turning a small winch the whole design is correctly demonstrated; the piston and slides repeat successively the different relative positions taken by the real machine. This result has been obtained by means of a very simple arrangement. Each movable organ is photographed on a special glass, and these different glasses are arranged in a frame which contains, on a fixed glass, the photography of the fixed parts of the apparatus represented. The movable glasses are each fixed to a connecting rod moved by a single winch; the length of each connecting rod being calculated in such away as to produce accurately the movement required.

The Audubon of the Pacific.—There is at present an American ornithologist residing in Mazatlan engaged in making a collection of the birds of the Pacific Coast, whose genius has already won for him the name of "the Audubon of the Pacific." His name is A. J. Grayson. Like Audubon, he is a native of Louisiana, and like him, he has devoted his life to a science most laborious and tedious in its completion, nice and particular in all its requirements. The great work, when finished, will be in four volumes, containing one hundred illustrations. The birds are represented in harmony with their habits—that is, each drawing contains representations of the plants, flowers and trees situated near the localities most frequented by the birds. Most of the pictures have three or four figures, representing the birds in their peculiar and most graceful positions.—*Correspondence Indianapolis Journal.*

Missouri Tin Mines.—Professor Shepard, of Amherst College, examined the tin mines near Iron Mountain. During his visit the managers showed him fine specimens of tin said to have been taken from their ore. They put several specimens of ore through the separating process, and exhibited a large quantity of tin as the result. He accordingly telegraphed to parties interested, "Evcrything appears to be as represented." Before making a regular report, however, he took specimens of ore, selected by himself, to his own laboratory; and he found that the percentage of tin was too small to pay for working. His final report was to that effect. He thinks the mines worthless, and says much money has been unwisely spent there.

One-horse Carts.—A horse, when he acts singly, will do half as much more work than when he acts in conjunction with another; that is to say, two horses will separately do as much work as three conjunctively. This arises, in the first place, from the single horse being so near the load he draws: and in the next place from the point or line of draught being so much below his breast, it being usual to make the wheels of single-horse carts low. A horse harnessed singly has nothing but his load to contend with; whereas when he draws in conjunction with another, he is generally embarrassed by some difference in rate, the horse before or behind him moviug quicker or slower thau himself. He is also frequently inconveuienced by the greater or less height of his neighbor. These considerations give a decided advantage to the single-horse cart.—*Lord R. Seymour.*

Ayer's
Hair Vigor,
For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long ou the hair, giving it a rich glossy lustre and a grateful perfume.

Prepared by Dr. J. C. Ayer & Co.,
Practical and Analytical Chemists,
LOWELL, MASS.
PRICE $1.00.
Sold by all druggists and dealers in medicine everywhere. Crane & Brigham, San Francisco; R. H McDonald & Co., Sacramento, General Agents. 25v18eow4m

A NEW
Gold Metal.
THE GOLD METAL WATCHES
Now being introduced by
C. E. COLLINS & CO.,
No. 629 Washington Street,
SAN FRANCISCO,
Surpass anything yet made in the way of an Imitation Gold Watch. They wear well, and keep good time.
The Ladies' Watches cost $8 and $10 each.
The Gentlemen's cost $15 and $20 each.
Chains, from $3 to $6 each.

RECOMMENDATIONS:

San Francisco, May 12, 1869.
This is to certify, that I have carried one of the small size Gold Metal Watches which I got of C. E Collins & Co., and I find that it runs as well, and keeps as good time, as any watch I ever carried, and I can therefore recommend them. I am engaged on the Sacramento steamer "Chrysopolis." C. A. COLBY.

I am engineer on the San Jose Railroad. I have been carrying one of C. E. Collins & Co's watches for about one year, and I can safely say it is the very best watch for time that I have ever seen. GEO. CORNWALL.
Engineer on the San Jose Railroad.

Batavia, July 6th, 1869.
Messrs. C. E. Collins & Co.—Gentlemen:—I received the Lady's Watch sent by you, and was much pleased with it. I wish to know what you will furnish me six of them for, with chains to match. Yours, etc.,
W. H. DUKE,
Batavia, C. P. R. R.

The public are cautioned against buying their watches at high prices, as many of them are sold for genuine *Gold Watches*, at from $100 to $150 each.
For List of Prices and Description of Goods, send directly to us. Can be sent by Express to be paid for on delivery.
C. E. COLLINS & CO.,
No. 629 Washington street, San Francisco.
P. S.—Where six watches of the above are ordered at one time, we will send one extra, free of all charges.
We also deal in the finest Gold and Silver Watches, Watch Materials, etc. Send for circulars or prices.

New Almaden Vichy Water,
(CALIFORNIA VICHY WATER.)
FROM THE SPRINGS,
NEW ALMADEN,
Santa Clara County.
F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.
OFFICE, 506 JACKSON STREET,
GENERAL DEPOT:
Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the venous circulation.
It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.
California Vichy Water is used with success in many cases, such as—
Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the Indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.
PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.
Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

Mining Property for Sale.
A Two Thirds Interest
OF THE
Golden Rule Mining Company's
Claims and Mill,
Situated in Tuolumne County, California, two and a half miles south of Jamestown, on the Great Mother Quartz Lode. A good 15-stamp Water Power Quartz Mill is situated on the property, with a never-failing supply of water, as can be shown by the last four years continual running. This Claim has three parallel Ledges, from 50 to 100 feet apart, averaging from two to six feet in width, with a length of six hundred feet. They are so situated that a tunnel has been run through them at right angles, making a surface drainage of from seventy to eighty feet in depth on the mine. The mine is well ventilated by shafts from the surface, and well timbered so far as worked. In the mine are steam Hoisting Works, capable of hoisting from a depth of 500 feet. A force of thirteen men only are required to keep both mill and mine running regularly.
On the surface and flats for a distance of 500 feet from these veins, the ground or surface was mined by placer miners, in former years, producing from two to five ounces per day to the man, during the season when water could be obtained, which fact goes to prove that a heavy deposit of ore was once contained in the croppings of these shutes, which, by all former and present theories of deep mine workings, came from below, indicating that when struck upon to a proper depth, the lead will develop a mine equal to the Amador or Eureka.
This claim has paid its 19th regular dividend of $1,500 each, during the past four years, besides all the construction and other expense of mine, and has levied no assessments during the same time, and at present has on hand $8,000 in the Treasury, and no debts.
The last level 150 feet from the surface rock, averaged $7 per ton, on which was a profit of from $1 to $1 50 per ton. The length of the two shutes of ore on the east vein, and the only one worked upon, has been about 200 feet.
Now I propose to sell two thirds of this valuable property for $16,000, cash; and any party who desires to purchase a property of this kind—which theory has proven that requires depth, on well known shutes of ore, for a sure fortune—can obtain a chance here, providing he or they will go down a sufficient depth. No purchaser is solicited unless he first goes and examine the mine, or sends a mining engineer in whom he can have confidence, to indorse what he may think proper of what has been here stated.
For any further particulars, direct by letter to Wm Bosworth, San Francisco, P. O. Box 1978, or at my office, room No. 5, over Donohoe & Kelly's Bank.
22v18tfqr WM BOSWORTH.

A Long Desired Article
For cleaning the head and hair. The cleaning of the head and hair has been the subject of consideration for a long time. This object will be accomplished by using
CAMILLE CHAMPOO,
which not only does away with the poor soap so offensive to use, and so injurious to the hair, but it cleans the head, strengthens and beautifies the hair, preserves the color and prevents baldness. It is cooling in nature, and can be used with safety and reliance on the smallest infant. Price 50 cents per bottle. Prepared by EMERTON & LUELLING, 773 Mission street, San Francisco, Cal.
HEATHFIELD & BOGLE, Wholesale Druggists, 206 and 208 Battery street, San Francisco, sole Agents for the Pacific Coast. 24v18-3m

THE GOLDEN ERA.
Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.
THE GOLDEN ERA
Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Where to Advertise.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local colums afford many items for our city cotemporaries, while its rates of advertising are reasonably low 10v17tf

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skilful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of home paths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

Copies of U. S. Patent Claims furnished immediately at small cost. Full copies of American or Foreign Patents can be obtained by telegraph or mail through this office at favorable rates.

For the Week Ending July 27th.

Gang-Plow.—Laban Holloway, San Francisco, Cal.—92,968.

Method of Extracting Iron and Other Oxides from Clay, Porcelain-Earth, etc.—William John Lynd, Golden City, Colorado Territory.—92,981.

Scraper.—Hon. T. G. Phelps, Belmont, San Mateo county, Cal.—93,000.

Method of Manufacturing Vinegar.—Francis Schleifer, San Francisco, Cal., assignor to himself and Francis Cutting. Antedated July 16, 1869.—93,012.

Velocipede.—David R. Smith, San Francisco, Cal., assignor to himself and Norbert Landry.—93,016.

Sawing Machine.—George W. Benson and Frank F. Doland, Sacramento, Cal.—93,043.

This invention relates to certain new and useful improvements in portable cross-cut sawing machines, whereby the saw is fed automatically to the wood to be cut, so that the amount of feed required will be given at each stroke of the saw, regularly and evenly, without any extra exertion of the operator. It consists in placing the saw in a slide, which moves back and forward in ways. Directly above the slide is placed a box, which moves up and down with the slide. A spring extends out over the saw, its opposite end being secured to the block, so that the end of the spring is always pressing down upon the saw, the block being carried downward as the saw is fed to the wood, and consequently keeping the spring, at all times, hearing upon the saw. By this means a wood-sawing machine is provided which can be moved from place to place, as desired, as it can be made very light. A man or boy can operate it with ease, and it can he easily arranged to be run hy any convenient power, if desired, after it is once placed in position.

Sluice and Concentrator.—Ezra Coleman, San Francisco, Cal., assignor to self and Dr. A. F. Cooper.—93,060.

The object of this invention is to provide an improved arrangement of metal-saving and sulphuret-concentrating devices, by means of which not only the heavy particles of gold, amalgam and quicksilver are saved, but also that portion of the amalgam and precious metals in the condition of what is generally called "float-gold," nearly the whole of which is lost by any of the modes of saving the precious metals now in use. The device consists of an arrangement of gradnated concentrating troughs, into which the pulp is precipitated after the free metal and amalgam have been extracted, and by means of which the sulphurets are concentrated. The special device for saving this portion of the gold consists in the employment of a blanket just the width of the sluice, one end of which is attached to the upper end of the same, and at a height just sufficient to allow the stream of water to pass heneath it. This blanket exteuds loosely the whole length of the sluice, so that when the stream of water is passing through, the hlauket will sweep the surface and take up snch fine particles of gold as may be floating on or near the top. This is reversing the ordinary uses of the blanket, which has heretofore been employed only at the bottom of the sluice. By this device they may be employed at both top and hottom, and may be extended to any length which may be required, or as far as any economical saving of gold can be made.

Gang-Plow. — Charles F. Gay, Albany, Oregon.—93,077.

Petroleum Burner.—E. P. McCarthy, San Francisco, Cal.—93,105.

This invention constitutes a device for the combustion of petroleum or other hydro-carbons for making steam or for other purposes. By its use ordinary wet steam from the boiler is passed from a jet-tube through a peculiarly-shaped pipe, in such a manner as to carry with it a large body of air, mixed with the steam during its passage. The oil to be burned is conveyed into this pipe at a point where it will fall into the blast of mixed steam and air in such a mauner that it is instantly converted into a fine spray, in which condition it enters the furnace, where it is burned with the aid of steam and air. The great difficulty encountered in burning hydro-carbons for steam purposes has been found in the use of retorts, which have generally heretofore been considered necessary for such combustion. This device entirely does away with all necessity for the use of retorts, while a most perfect combustion is effected. The device is extremely cheap and simple, and is readily adjustable to any furnace. In addition to its use for making steam, it is thought to be eminently practicable for cupolas and puddling furnaces. We shall probably soon give an illustrated description of this new and important invention.

Process of Purifying and Refining Alcoholic Liquids.—Francis Schleifer, San Francisco, Cal., assignor to himself and Francis Cutting, same place.—93,127.

Shingle Machine.—G. F. White, Aurora, Oregon.—93,148.

New Incorporations.

Moneta S. M. Co.—White Pine. August 2. Capital stock, $1,440,000; 28,800 shares, $50 each: Trustees: S. H. Roberts, B. R. Freeland and L. J. Lewis.

A PAMPHLET,

JUST PUBLISHED ON THE

TREATMENT OF REBELLIOUS SILVER ORES

—BY—

AMALGAMATION WITHOUT ROASTING

BY CHAS. H. AARON,

Assayer and Metallurgical Chemist.

This Pamphlet contains 8 pages of concisely written matter, by a practical working Metallurgist.

Published by DEWEY & CO.,

Publishers and Patent Agents, Mining and Scientific Press Office, 414 Clay street.

The Trade Supplied at Wholesale Rates.

1v19-lamtf

To News Agents.

From July 1st, 1869, News Agents desiring five or more copies weekly of the Mining and Scientific Press, will be furnished direct from the office, at a reduced price from former rates. Orders for a less number can best be supplied through San Francisco wholesale agents.

RETURNED.—Dr J. H. Pinno, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, OR Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 23 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. HOWLAND.

DR. HALL has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Dewilz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18 3m

Asiatic Cholera.—The Strongest Proof of Intrinsic Merit.—DEAR SIR: I ought to have acknowledged long ago the box of Pain Killer you had the goodness to send me. Its coming was most providential. I believe hundred of lives were saved, under God, by it. The Cholera appeared here soon after we received it. We resorted at once to the PAIN KILLER, using as directed for Cholera. A list was kept of all to whom the Pain Killer was given, and our native assistants assured us that eight out of every ten to whom it was prescribed recovered. It has proved an incalculable blessing to multitudes of poor people throughout all this region. Our native preachers are never willing to go out on their excursions without a supply of the PAIN KILLER. It gives them favor in the eyes of the people, and access to families by whom otherwise they would be very indifferently received. Relieve me, gratefully and faithfully yours, J. M. JOHNSON,
Missionary, Swatow, China.

The Pain Killer is sold by all Druggists and dealers in Family Medicines.
REDINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents. aulu

To all who use Planes.

The superiority of Iron Planes over those made of wood, for durability and accuracy, is no longer a question and the objections of high price, extra weight, and "sticking" to the wood, of those formerly introduced, are now overcome by the PALMER'S PATENT.

Some of its Peculiarities—The Throat is adjustable, and can, in an instant, be made very fine, or very coarse. The Bit is set for the work to be done, by simply moving a lever. The Bit is squared with the face of the plane, by another lever. Both of these movements are instantly and easily made by the fingers, without loosening the bit. The Bit is fastened by a toggle-joint, and can be put in and taken out "as quick as wink." The Bit is firmly bedded, at its heel, close to the bevel, on exact, brass bearing, and when the toggle joint is closed, it is tightly pressed upon them, and never trembles. It is, therefore, just the Plane for hard woods, the ends of wood, etc.

What it will do—It works very easily, and is just the thing for fine work of every kind, and for tough "catty" timber, which it smoothes perfectly. On the ends of wood, hard or soft, it works peculiarly well. Try it.

Several Planes in one.—The Jack-Plane, for instance, is at once a Smooth, a Jack and a Fore Plane, and for mitres, is also a Block-Plane, and, in an instant, can be changed to either. In fitting Sash, Doors, Blinds, etc., it is the only Plane required. Three of our Planes do the full work of four wooden Planes, and thus save chest room and luggage.

It Works Hard Wood Perfectly—Here its accuracy and nice adjustments come into full use, and no other Plane can compare with it.

Agents Wanted to take orders for these Planes. Call and examine them and learn full particulars, at the CALIFORNIA WIRE WORKS of

The Most Important Invention of the Day.

HALL & LEE'S

New Method of Packing Stationary Joints in Steam Engines,

—AND ALSO IN—

STEAM AND WATER PIPES.

BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam tight inside as well as outside, thereby effectually preventing the steam from cutting into the joints of the steam chest. Consequently, an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam-tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869. By permission we refer to C. J. Kinney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville. State, County and Mill Rights for sale by A. H. HALL & H. T. LEE, Marysville, Cal. 6v19-3m

GAS! GAS! GAS!

MACHINES!

THIS MACHINE,

MANUFACTURED BY THE

Boston Union Gas Company,

Is the result of several years of experiment and investigation, until to sum the whole, we can warrant a perfect machine.

It is Simple in its Action

AND THOROUGH IN ITS CONSTRUCTION.

It will last a lifetime; requires not more than three minutes's attention a day, to wind up the weight; generates gas just as fast as it is wanted, and stops making the moment you stop using it; gives the

Cheapest, Softest, and Most Diffusive Light

yet discovered. It will make abundant gas from a cheaper and lower grade of fluid than

ANY OTHER MACHINE IN USE,

and works in cold climates as well as warm. Only those who have used Gas Machines knew what this means. Complete or partial failure in cold weather has destroyed confidence in them more than all other causes combined.

The Union Gas Machine entirely obviates this difficulty by a simple contrivance, patented and owned exclusively by this Company, and by which we warrant each and every Machine to operate successfully in winter or summer in any climate or country. It is the only Machine that claims to work outdoors in cold climates, and the only one that fulfills the requirements of the insurance companies without increase of risk. For country residences you save the breakage of lamps, and your lights are always clean. Away from the city, a Gas Machine affords one of the most pleasant and valued of city comforts. Of the advantages of Gas Machines, you pay for no more Gas than you actually consume. People sometimes imagine they do this with a machine. It is impossible; and the same amount of light will not cost one-half the cost of coal gas, besides being much more brilliant.

Where the pipe is already in the building according to the regulations required by the coal gas companies, or where parties wish the entire work of piping fixtures and furnishing, Machine, etc., by us, we will do everything and warrant everything.

The following card from Mr. Atkinson, 538 Market street, who has been THE FIRST TO INTRODUCE this light in this city, will be read with interest:

SAN FRANCISCO, January 25th, 1869.

MESSRS. D. SIMPSON & Co., Agents of the Pacific Union Gas Company, 117 Sutter street—Dear Sirs: I have for the past two months been using the light produced by the "BOSTON UNION GAS CO'S GASOMETER," now for sale by the PACIFIC UNION GAS COMPANY, and am well satisfied to continue using it. I find that it is equally safe as city gas, more brilliant, and less injurious to the eyes. I formerly paid to the Gas Company fully **100** PER CENT. MORE than it now costs me to light my premises. Any persons who may wish to introduce this Light can call at my store, No. 538 Market street, and I will satisfy them as to its economy and merits. JAMES ATKINSON.

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at **11** o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **10th, 17th** and **30th** of each month that has **30** days.

On the **10th, 18th** and **30th** of each month that has **31** days.

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 17th falls on Sunday, they will leave on the Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departure of the 17th or 18th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

The following Steamships will be dispatched on dates as given below:

August 9th—SACRAMENTO.....Capt. W. H. Hudson, Connecting with ALASKA, Capt. Gray.

August 18th—GOLDEN CITY.....Capt. Wm. F. Lapidge, Connecting with HENRY CHAUNCEY, Capt. Cannor.

August 30th—MONTANA..... Capt E. S. Farnsworth, Connecting with ARIZONA, Capt. Maury.

Passengers berthed through. Baggage checked through. One hundred pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets to Liverpool by the "Inman" and "National" Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of $100 to $200 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship JAPAN, Captain J. H. Freeman, will be dispatched for YOKOHAMA and HONGKONG on SATURDAY, September 4th, 1869, at noon connecting at YOKOHAMA with the steamer NEW YORK for SHANGHAI. Shippers of freight to China or Japan are requested to mark on each package its destination.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Saeramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

New Mining Advertisements.

Alleghany Consolidated Gold Mining Company, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of August, 1869, an assessment of fifty (50c) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the seventh day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twenty-third day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.
Office, 37 New Merchants' Exchange, California street, San Francisco. au7

Kincaid Flat Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of August, 1869, an assessment of two dollars and fifty cents ($2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 220 Clay street, San Francisco. Any stock upon which said assessment shall remain unpaid on the eighth day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twenty-fifth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary.
Office, 220 Clay street, San Francisco, Cal. au7

Office Senator Silver Mining Company.—Location of Mine: Storey County, State of Nevada.

NOTICE.—The Annual Meeting of the stockholders of the Senator Silver Mining Company will be held on WEDNESDAY, the twenty-fifth day of August, 1869, at one o'clock P. M., at the office of the Company, No. 408 California street, for the purpose of electing a Board of Trustees to serve for the ensuing year, and for the transaction of such other business as may properly come before the meeting.

T. B. WINOARD, Secretary.
San Francisco, August 6th, 1869. au7

Yosemite Mining Company, Humboldt County, Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the second (2d) day of July, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
W N Wade....	148	315	$157 50

And in accordance with law, and an order of the Board of Trustees, made on the second (2d) day of July, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. S. L. Jones & Co., auctioneers, 207 and 209 California street, on Tuesday, the twenty-fourth day of August, 1869, at the hour of 1½ o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Coal Tar as a Wood Preservative.

Dr. Adolph Ott gives in the *Scientific American*, some experiments which were undertaken by M. Rottier, Professor of Chemistry at the University in Ghent, Belgium, in order to determine what ingredients of coal tar are most effectual in protecting wood from rot. Rottier's experiments extend over the following constituents of coal tar: 1, The light oil; 2, the oil containing phenic or carbolic acid; 3, the oil containing aniline; 4, the naphthalized oils; 5, the solid residue; 6, the green fluorescent oil distilling between 275 and 320 Centigrade, containing pyren and paranaphthalin.

The light oil was found to be of no avail, for the wood treated with it decayed within the same period of time as wood that was not treated at all. The delay in decomposition produced by aniline oil amounted only to 6·66 per cent.

Prof. Ott says: "It is well-known that carbolic acid affords an excellent means for preserving animal matter from putrefaction. This fact has led to the conclusion that the heavy tar oils would be as excellent for preserving wood, they being the chemist's source for carbolic acid. Rottier found this not confirmed. Decomposition set in after the usual time, whether the acid was employed in solution, in benzine, or otherwise. Tar oils which contained not a trace of carbolic acid proved to be just as ineffectual as oil to which a considerable portion of the acid had been added. Naphthalin has proved to be very powerful in protecting collections of natural objects against the ravages of insects. It might, therefore, appear that it was the proper agent for preserving wood. This is not the case, it being too volatile to be adapted for the purpose in question where time and external agencies play such an important part. However, quite favorable results were obtained with the greenish fluorescent oil that comes over at the last stage of the distillation. Direct trials with pyren and paranaphthalin did not yield successful results. It must, therefore, be concluded that it is the green fluorescent oil to which the preserving action of coal tar must be attributed. "Is the same contained in sufficient quantities in the latter to justify its employment for preservative properties?" I am inclined to answer this question in the negative rather than in the affirmative."

Manufacture of Iron Pipe.

We find the following description of the manner in which iron gas and water pipes are made, in *Once a Month:* "A hollow spindle, or tube, the length of the pipe required, is covered with a rope composed of straw, and the latter covered evenly with loam about the consistency of mortar. This spindle is next placed in a drying oven, dried thoroughly and washed carefully with a composition which prevents the loam from adhering to the metal. At this stage it is termed the 'core,' around which the pipe is to be cast. A large iron flask, corresponding in length with the core, in the form of a cylinder, constructed in such a manner as to open and shut as a hinge is opened, is placed on end (the sides being held together firmly with clamps), an iron pattern corresponding in size with the diameter of the pipe inserted, and the intervening space filled with sand. The iron pattern or shaft is then withdrawn, the mold washed with the composition described, and the flask placed in a drying oven. When thoroughly dry, the flask is placed on end in a pit, the core placed exactly in the center, and the boiling metal poured in from the top, as in casting bells. If the metal were cast around a perfectly solid cylinder it would crack from end to end, or burst into fragments on cooling, from which it will be seen that the straw serves as a cushion which accommodates itself to the strain brought to bear upon it. When the metal has remained a sufficient length of time in the mold or flask, the latter is taken from the pit, the clamps removed, and the pipe turned out. The core is afterward pulled out, and the pipe is complete."

Six Days from Ocean to Ocean.—The Philadelphia *Bulletin* has the following: "A palace car full of passengers that left San Francisco less than a week ago arrived at New York this morning, thus traversing the whole continent in the short space of six days. Passengers who came in it may embark to-day for Europe, and arrive in Liverpool in nine days more, thus traversing the whole distance from the shores of California to the shores of England in fifteen days."

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

21v16-3m W. McGRINDLE Manage.

That will resist the extremes of heat and cold without liquefying or hardening.

It is therefore peculiarly adapted to the varied climate of this coast, especially localities where THE WEATHER BECOMES EXCESSIVELY HOT, causing oil and all other kinds of grease to run from the axle, retaining the proper position. It remains set until exhausted, leaving no deposit of GUM TAR OR PITCH. Its superior lubricating properties, durability and cheapness have been tried and approved by the CENTRAL PACIFIC AND OTHER RAILROADS, STAGE PROPRIETORS, STABLE KEEPERS, TEAMSTERS, CONTRACTORS, MILLMEN, FARMERS, and many others who prefer to

USE NONE BUT THE BEST.

It being prepared by a peculiar CHEMICAL COMBINATION OF OIL, previously freed from gum or other deleterious substances, it must be obvious that by its use friction will be reduced to the lowest point. We feel assured that all desiring A NO. 1 LUBRICATOR will give this the preference over any other Grease IN THE MARKET.

Sold by the Trade generally, and at the Factory, **109** Commercial street, San Francisco.

24v18-3m **PETTIT & CO.**

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL, are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address DEWEY & CO., Mining and Scientific Press office San Francisco.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, but one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

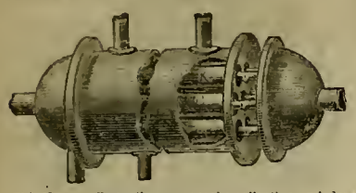
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, **220** Fremont street.

1v1 San Francisco.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

WM. B. CROSS,

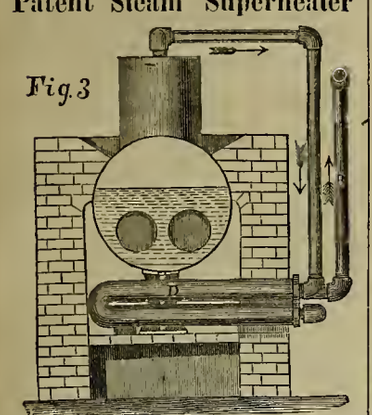
Important to every one using Steam for any purpose.

CARVALHO'S
Patent Steam Superheater



[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1860.

"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after *seven* years of service.)

"S perheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.

"Superheater saves 10 at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.

"Superheater saves 25 per cent of coal, less steam pressure, exhaust more serviceable in drying paper."

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.

"Superheater saves not less than 20 per cent. fuel; no priming!"

CROCKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.

"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y. DYEING & PRINTING ESTAB., Oct 4, 1867.

"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINUOUS OIL REFINING CO., Binghampton, N. Y., Sept. 23, 1867.

"Superheaters give entire satisfaction, and we super heat to 55 deg—an increase of 20 deg."

CARSEW MANUF. CO., So. Hadley Falls, Mass., Oct. 17, '67.

"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867.

"Superheater saves at least 25 per cent in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867.

"Superheater saves 25 to 30 per cent. in fuel; no priming"

CONTRA COSTA LAUNDRY, Oakland, July, 1868

"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAYLAN M. CO., Cal., August, 1868

"Superheater causes a use of 10 lbs. steam instead of 60 be; use much less water, and there is a saving of fuel." (2 acts.)

SIXTH MECHANICS' INST FAIR, S. F. Sept 4, 1868.

"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.

"Superheater is a perfect success, and saves three cords of wood in ten, or 33⅓ per cent. in fuel; engine works better."

And many other letters of the same tenor.

Awarded Silver Medal, Mechanics' Institute, San Francisco, 1868.

Awarded Silver Medal, Maryland Institute, Baltimore.

Awarded Silver Medal, American Institute, New York, 1865.

Send for Circular to ÆTNA IRON WORKS, San Francisco, California. ROBT. L. HARRIS, Agent.

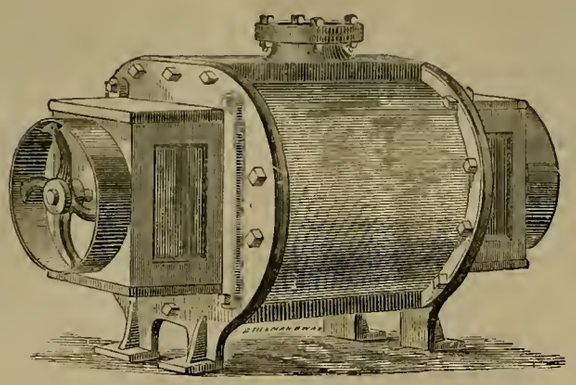
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

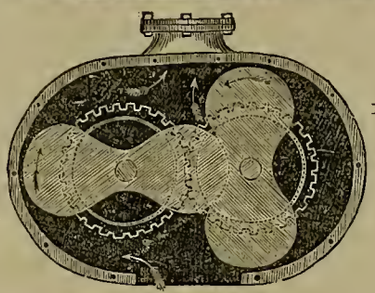
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.



Patented Nov. 1st, 1864; July 21, 1868; and Oct. 6, 1868.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

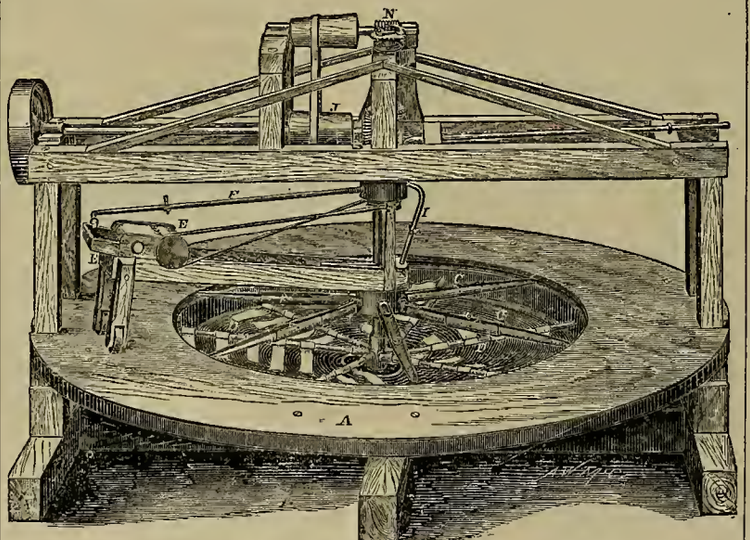
Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

KEEP & BARGION,
4v16-3m **Globe Iron Works, Stockton, Cal.**

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFCATES:

GRASS VALLEY, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.

WM. L. TISDALE, Supt. Star Spangled Banner Mine.

NEVADA CITY, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

Information for Inventors and Patentees.

AN EXTRACT

From the American and Foreign Patent Agency Circular of the Mining and Scientific Press, Dewey & Co., Publishers.

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procnre the *issue* of the papers as soon as granted, saving at least several weeks time which wonld otherwise be required for the inventor to receive notice and then forward the money. Money advanced for this pnrpose will be returned, should the application be rejected. By adopting this course, we are enabled, *with our other advantages*, to secure the *receipt* of patent papers to inventors on this Coast, several months sooner than can generally be done through agents in the East,—without the applicant going to the risk and expense of sending on the last fee before it is known whether the patent will be granted.

Self-Evident Facts.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confidcnt of onr ahilities to assist inventors in patenting their inventions, saving them from vexatious delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being scnt to tbe Patent Office.

In early days bnt little preparation was needed, or but ordinary skill requircd 10 obtain a patent; but now, hy reason of the multiplicity of inventions, and the numerous Acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing tbrough the legal ordeal of an infringement suit.

The general practice of the Patent Office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863, and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of *responsibility* and *experience*. As agents with such qualifications, we solicit bonest patronage.

To Eastern Inventors.

Our close proximity to British Columbia, Mexico, Central and South American States, Australia and the Islands, enablcs us to obtain Lctters Patent for you with much less *delay* and expense than they can he secured through any other agency in the United States.

Melbourne, in Australia, is a city of larger proportions that San Francisco, besides the adjacent colonies are of great commercial and mineral importance. Inventions of all kinds, but especially those relating to the saving of gold and silver, if secured in Australia, will often prove of great value. We have competent agents there, and can promise tbat the business will he attended to with fidelity and dispatch.

By Telegraph.

In cases of immediate importance we can have tbeir progress reported by telegraph, so that applicants know immediately the result of the examination and decision of the Patent Office. We also make examinations by telegraph regarding the patentahility of inventions; examine patent assignments ou record at Washington; obtain copies of patents or claims, and also derive other information desired iustantly from the Pateut Office.

Reasons for Success.

We would especially call the attention of the inventive public to the fact that our Patent Agency is taking out a larger number of Patents than any other ngency west of the Mississippi River. We do our work promptly and thoroughly, and refer to nur standing amongst inventors as an evidence of our success in our special department. Our work is all done inside of our office, BY COMPETENT AND RELIABLE PERSONS, who have been for ycars interested and associated with us. We therefore are not compelled (like many agencies) to trust valuable and important inventions promiscuously to outsiders, to have part of the case prepared, but inventors can depend that, from the time their cases are first placed in our office, they are kept with proper secrecy until full rights are secured in the Patent Office in Washington. Tbis is an important point in the proper prosecution of Patent business. It is a notorious fact that some prominent ageficics trust a considcrable portion of their cases to apprentices and amateurs. A deficiency or want of attention to the small nffairs of any kind of business will often prove as harmful as a flagrant violation of the most important rules which govern and control it.

☞Our Illustrated Pamphlet, from which the above is an extract, will be furnished free on receipt of postage stamp. Confidential advice given, and every legitimate branch of Patent Soliciting business promptly and faithfully executed, by

DEWEY & CO.,
Publishers Mining and Scientific Press, 414 Clay street, San Francisco.

Subscribe for the

Mining and Scientific Press.

PUBLISHED EVERY SATURDAY,
—BY—
DEWEY & CO.,
414 Clay Street, San Francisco.

If you are an Inventor, Patentee, Miner, Farmer, Manufacturer, Mechanic, or a progressive Student or Artisan in any Industrial or Professional Calling in the Pacific States or Territories, you are doing yourself irreparable injustice, if not already a subscriber and reader of the MINING AND SCIENTIFIC PRESS.

It contains hints and information enongh to repay the subscription price many times in a single month.

Its columns are filled with instructive reading in plain, comprehensible and attractive form to minds of ordinary intelligence.

It contains 16 pages and 64 columns of the size of Harpers's Weekly, and is the best printed and most valuable paper on the western half of the continent. All claims of patents issued to inventors on this coast are reported. Illustrations of new machinery are given each week. Descriptions of new inventions and discoveries throughout tbe world, are given, with fresh and comprehensive information of scientific developments and mechanical and industrial progress, which cannot be obtained from books, or readily found gathered in so convenient a form elsewhere. Subscribe now, and you will not regret it.

OPINIONS OF THE PRESS.

MINING AND SCIENTIFIC PRESS.—The Mining and Scientific Press, published at San Francisco hy Dewey & Co., is one of the most valuable of our exchanges.

Miners, mechanics, and the reading public generally, will find its regular perusal profitable and interesting.

Its scope and purpose are expressed in the title, and we recommend miners and mechanics in particular to subscribe for it. Terms $5 per annum, in advance.—*Trinity Journal, March 13th.*

MINING AND SCIENTIFIC PRESS.—This useful and scientific journal has entered upon its eighteenth volume.

To the scientific, mechanic, and practical men of all classes it is almost invaluable; and we are glad to learn that it is increasing in patronage every day.

The publishers, Dewey & Co., San Francisco, say the present volume shall be superior in all respects to its predecessors.

The terms are $5 in advance, $3 for six months.—*San Bernardino Guardian, March 6th.*

THE PRESS is one of the most valuable and instructive papers published in the United States, and every miner, millman, machinist and foundryman should he a subscriber. The information to he derived from its columns is worth many fold tiincs the subscription.—*Grass Valley National.*

MINING AND SCIENTIFIC PRESS.—This excellent scientific journal has entered upon its eighteenth volume.—*Chico Courant, Jan. 15th.*

THE *Mining and Scientific Press* should have an extensive circulation in every mining community on the Coast.—*Placer Herald, Dec. 19.*

W. FRANK STEWART is Dewey & Co's accredited agent for the Patent husiness in this city, and will attend to their affairs in that specialty.—*San Jose Mercury.*

MINING AND SCIENTIFIC PRESS.—This journal is devoted to mining and scientific researches, and has been conducted with great ahility. It has been greatly enlarged and improved.—*San Jose Patriot.*

THE MINING AND SCIENTIFIC PRESS has become almost indispensahle to the miner and machinist, and is well deserving of the patronage which we are pleased to learn it receives.—*Mariposa Mail, Jan. 10th.*

THE PRESS is a credit to the State, and is fast gaining in popularity. It commends itself to all classes, and we hope many in this section will become subscribers.—*Pajaronian.*

THESE gentlemen not only print a first-class scientific and mining journal, but are also trustworthy Patent Agents, and doing much towards the inventive business of this coast.—*San Jose Mercury.*

THE MINING AND SCIENTIFIC PRESS commenced a new volume with the new year. It is a credit to the State, and to the mechanic or miner, is a great source of valuable information. It has every appearance of prosperity, and we hope it may continue growing in wealth and influence.—*Pajaronian.*

WE CONSIDER THE MINING AND SCIENTIFIC PRESS the most valuable mining and mechanical newspaper issued in the United States. Dewey & Co., publishers, are also solicitors of foreign and American patents and conduct patent cases of every kind. We guarantee that all business confided to them will be carefully attended to, and we further believe that every miner, mechanic, and scientific man should have their valnable paper.—*Auburn Stars and Stripes.*

NEW VOLUME.—The MINING AND SCIENTIFIC PRESS has entered upon another year's work looking inproved and promising. This paper is devoted to the interests of the scientific world, and to the miner and mechanic is almost invaluable.—*Gilroy Advocate.*

TO MINERS.—William H. Murray, traveling agent for the Mining and Scientific Press, publlished by Dewey & Co., of San Francisco, is in town soliciting subscriptions for that paper. To the intelligent miner, a paper like the *Press* is particularly valuable, keeping him posted on the latest discoveries in reduction of ores, new machinery, etc.—*Grass Valley National.*

MINING AND SCIENTIFIC PRESS.—We look upon this paper as one of our most valuable exchanges, in fact it deservedly stands at the head of all publications embracing mining, scieutific and mechanical subjects, and contains much miscellaneous matter of interest, and is a gem of neatness. The PRESS is published by Dewey & Co., San Francisco, and at its present low price of five dollars per annum, should be patronized by every one, hut more especially by miners, mechanics and inventors who wish to pursue their avocations with intelligence and economy.—*Tidal Wave, Idaho.*

THE MINING AND SCIENTIFIC PRESS has entered upon its XVIIth Volume. It has donned a new-style hat; or, in newspaper parlance, a new heading, which givesit the solid, scientific look it merits. Other improvements typographical are also noticeable. No call for improvement in its matter.—*Amador Ledger, July 18th.*

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on its subscription books.—*Nevada Gazette.*

Subscription, $5 per annum; $3 for six months—in advance. Sample copies free.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; staud on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco. Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

N. W. SPAULDING,
Saw Smithing and Repairing
ESTABLISHMENT.

Nos. 17 and 19 Fremont St., near Market,
MANUFACTURER OF
SPAULDING'S
Patent Tooth Circular Saws.
They have proved themselves to be the most durable and economical Saws in the World.
EACH SAW IS WARRANTED IN EVERY RESPECT.
Particular attention paid to construction of
Portable & Stationary Saw Mills.
MILLS FURNISHED AT SHORT NOTICE,
At the lowest Market Prices.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Mineral Land Surveys.

Government surveyors, says the Amador *Ledger*, are now at work running off Amador county into townships, preparatory to sectionalizing and the further subdivision of sections. It is not known whether the object of this work is preparatory to bringing the mineral lands of that county into the market for sale, or for the purpose of protecting the timber from destruction. It is more than probable this step has been taken to answer the demands of settlers on the foot-hill lands, who are anxious to secure titles in view of the prospective value of such lands for agricultural purposes. It is characteristic of the American agriculturist to desire a title to the soil he cultivates; and settlers, as a general thing, will not make permanent improvements until such a title has been secured.

Our cotemporary truthfully says that the agricultural, horticultural and viniculturaI resources of the mountain counties are but little understood, even in some parts of our own State, and not understood at all outside of it; hence the want of thrift in those counties where mining has ceased to be the principal industry. But when the real value of the above named branches of industry in our mountain lands shall be generally known, and fair markets are opened up for our products, we shall not fail to receive our share of intelligent immigrants, seeking homes under the genial skies of California. Although the mountain counties are now depressed, and, after flooding the world with gold for twenty years, find themselves involved in debt and oppressive taxation, still they nevertheless have a future before them not wholly without brightness; and should the experiment of tea culture, now begun in a neighboring county, prove a success—as everything so far gives evidence that it will—then the mountain lands, with this addition to their sources of wealth, will at once become the most valuable of any on the Pacific slope.

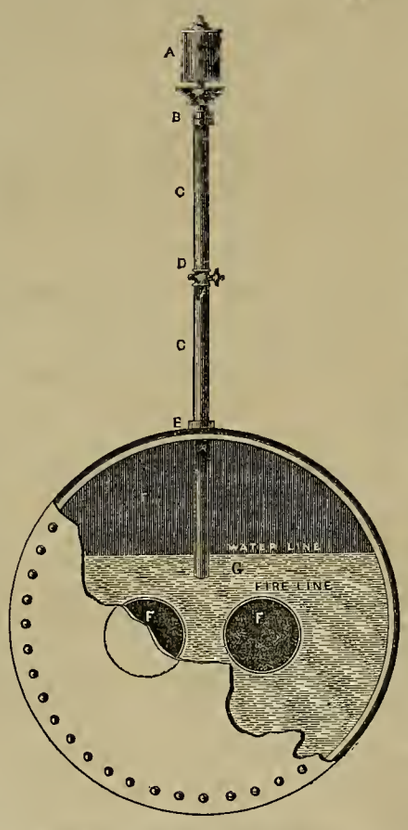
ANCIENT JERUSALEM.—Excavations now going on at Jerusalem, under direction of Lieutenant Warren, show that the ruins of ancient Jerusalem still exist beneath the modern town.

THE deepest sea sounding ever taken showed a depth of 6¾ miles.

Improved Low Water Detector.

Numerous devices have been brought forward for producing an automatic alarm to give warning when the water in a steam boiler reaches a position dangerously low; but we doubt if anything more effectual or simple than the one herewith illustrated has ever been devised. Its perfect simplicity will be seen at a glance. It may be attached to any part of a boiler, and it is almost impossible that it should fail to give the fullest warning the instant the water passes below the line fixed for "low water."

Referring to the engraving, A represents an alarm whistle; B, a coupling supplied



with an internal flange on which is placed a disk of fusible alloy, secured by the shank of the whistle being screwed down firmly on it; C, C, a tube (gas-pipe answers the purpose); D, a cock; E, a coupling by which the tube is attached to the boiler. The manner of connecting the detector to the boiler, whether tubular, flue or cylinder, is readily seen; the operation being simply to bore a hole at the point of connection, as shown in the cut, for the admission of the coupling, E, passing the pipe through till it reaches down to within one or two inches of the fire line, the portion of the pipe outside the boiler being from four to four and a half feet in length.

The operation of the instrument is as follows: After the boiler has been filled to the water line and steam raised, the pressure of the steam forces the water up into the tube. There being no circulation in the instrument so long as the lower end of the tube remains *under* water, that part of the column above the cock, D, will be of comparatively low temperature, and the disk will remain solid. But whenever the water in the boiler falls *below* the end of the tube the steam immediately displaces the water in it, and melts the fusible disk, and rushing out through the whistle gives notice that the water in the boiler is falling to a dangerous point. To replace a disk, unscrew the whistle, and fill that portion of the tube above the cock with cold water. Insert the disk, screw the whistle down hard enough to prevent leakage, and open the cock. When trouble may be apprehended from an incrustation of the fusible disk, so that it will not readily melt when the steam is admitted to it, it will be but the work of a moment to close the cock at D, thus shutting off communication with the boiler, when the whistle can be removed, the disk cleared of any incrustation, replaced, the whistle screwed on, and communication opened again with the boiler.

The construction of this device may be seen at Wm. T. Garratt's Brass Foundry, corner of Fremont and Mission streets, San Francisco. Mr. G. will give all needful information and furnish the detector to order, in any style and quantity to suit.

GRANITE FROM MASSACHUSETTS. The granite for the new Mint, it is said, is to be imported from Massachusetts. The stone will be quarried, dressed and fitted in that State, and then sent thousands of miles to be laid up into form. Of course the contract was let to the lowest bidder; but really the project, or the necessity for it, is strongly suggestive of something wrong in our labor system, especially when we have such noble quarries of granite at Folsom and Rocklin, and that, too, directly on railroad routes. The high price of labor here, still further increased by the operation of the eight-hour system, rendered it impossible for contractors to base their bids upon California labor. Consequently the chief part of the labor is done in Massachusetts, while California laborers are suffering for employment. Contractors say that the difference amounts to twenty-five per cent. in the cost of construction.

FOSSILS IN SHALE.—Mr. Barkas, of Newcastle, Eng., offered prizes to coal pit boys to induce them to search for fossils. The result has been that large numbers of fossil remains have been picked up; and recently one of the lads found the lower jaw of a true mammal. The discovery is one of great interest.

New Books.

MECHANICAL SAWS.—(From the Transactions of the Society of Engineers, 1867.)—By S. W. Worsam, Jun. Illustrated by eighteen large folding plates. Philadelphia, Henry Carey Baird—1869. 8vo. pp. 36.

This book treats its subject with completeness, although the text is comparatively brief. The large folding plates form the especially valuable feature of the work. All forms of saw-teeth, saw-sets, gauges, files and other tools used about saws, saw-sharpening machines, timber frames, buckles, tillers, etc., etc., are given in outline, with all the measurements and dimensions, so as to form complete working drawings of the same. Full explanations of all these drawings, and full directions for the use of all the apparatus, are given in the text. We give a short extract to show the style:

"The rules for regulating the forms of saw-teeth must necessarily be arbitrary, as much depends upon the nature and quality of the wood, and the direction in which it has to be sawn. In cross-cutting, the object is to sever every fiber or thread, and as the material in this direction is almost non-elastic or unyielding, teeth of an acute and nearly lancet-shape must be employed, so that acting like a series of knives in rapid motion, they cut the threads asunder rapidly and sweetly, the saw-dust produced having a fine granular appearance. On the other hand, in ripping or cutting with the grain, the desideratum is to separate the texture, as it were; and as in so doing the teeth do not meet with so much resistance and resilience from the filaments as in cross-cutting, they may be made much larger and coarser, thereby producing small shavings or chips, rather than saw-dust."

For sale by A. Roman & Co. Price, $5.

A TREATISE ON THE TEETH OF WHEELS; demonstrating the best forms which can be given to them for the purposes of machinery, such as mill-work and clock-work. Translated from the French of M. Camus, by John Isaac Hawkins. Third edition. Philadelphia: Henry Carey Baird. 1869. 8vo. pp. 102.

M. Camus handles the subject scientifically, and on true mathematical principles. The teeth of wheels should be made exactly right; the matter properly admits of no guess-work, although it is too often done by "rule of thumb." Even with workmen who profess to be guided by system in laying-out the teeth of wheels, there is much indefiniteness. One places the leg of his compass at the center of a tooth to describe with the other leg a segment of a circle for the next tooth, and others place it at different distances from the center, each,—says the editor,—according to some inexplicable notion received from his grandfather, or picked up by chance." The duty of properly constructed wheels is performed more equably, and with less expenditure of force,—and the wear being less, of course more cheaply,—than is possible with wheels mapped out by the eye, however practiced an eye it may be. The whole subject is reduced to demonstration in this book, and illustrated by eighteen plates. The appendix, by the editor, Mr. Hawkins, contains much valuable information. For sale by A. Roman & Co. Price $3.

FIFTY-DOLLAR parasols, with watches in the handles, are the latest frivolity at the East.

Communications.

The New Roasting Furnace of the American Mining Company.

Written for the Mining and Scientific Press.

Most of the Colorado ores have been subjected up to this time to all the different ways of amalgamatiou. The method least to be recommended is the stamping of the raw ore, with amalgamation following directly on shaking tables. Steam amalgamation furnishes better resnlts (up to sixty per cent. of the precious metals); but Keith's process is the best. This process consists in pulverizing the raw material in a Ball crusher, blowing the product down an inclined furnace shaft through the flame by a ventilator, and finally amalgamatiug. It is asserted that hy this process the ore is "dead"—roasted—and that ninety per cent. of the gold is secured. But neither one nor the other is actually the case. Experiments made with the roasted ore revealed the fact that it contained sulphates in abundance, among them eveu sulphate of iron. As to the percentage of gold secured, it was ascertained that it amounted at best to 75 per cent., while copper and silver were entirely lost. But just at the present moment, when the time is not far wheu, by the completion of the Union Pacific Railroad, a chance is offered to profitably gain the large contents of copper, its loss is to he considered an important deficiency in the process, not to mention at all that the process is not fit for ores with even a small percentage of lead, and that large masses of ore are lost as dust, as any one can see who takes a look at the works.

Aa soon, therefore, as by direct communication with the East the conteuts of copper in the Colorado ores begina to enhance their value, amalgamation will have to be given up, and the smelting process will have to be introduced. This process, even now, when there is no direct and cheap communication with the States, may be considered as the hest.

At Lyons' works, at Black Hawk, it has been used for some time; but owing to the fact that a more complicated and dearer way—the cupelling with lead—was chosen, it did not come into more general use. Besides heing complicated, this process has to labor nnder the disadvautage that considerable losses must be encountered by lead going into the slag and carrying gold and silver with it. The gold and silver in one ton of the lead, contained in the slag, was found to be worth $100. This disadvantage, as well as the large amonnt of fuel used during the different operations, and the high wages, have caused the abandonment of this process also. Instead of it, the ore is roasted now so far that enough sulphur is left still to make the formation possible during the following smelting of a matt, which contains, besides all the gold and silver, as much copper as possible. Adapting tho process to the present circumstances, a matt is secured which contains enough copper to pay the expense of transporting it to England.

The first requisite for a smelting process in Colorado is always a well conducted and cheap roasting of the ore; hut of the great variety of contrivances invented for that purpose, only one suits the requirements made of a perfect roasting apparatus. That is the terrace-furnace of tho American Mining Company.

The conditions of a perfect roasting furnace consist of the followiug:

1. Cheapuess of the apparatus.
2. Cheapness of working it.
3. Perfect removal of the sulphur contained in the ore.
4. Ease of regulating coustantly the temperature, and cousequeutly the whole process.
5. A long and uuinterrupted working of the apparatus.
6. The saving of all the sulphurous acid produced hy the roastiug for the production of sulphuric acid.

To all theae requirements the terrace furnace responds in the most perfect manner. None of tho apparatus invented up to this time can compare with it favorahly. Its form and arrangement are briefly described in the following:

The furnace is a shaft twenty feet high, four fcet wide and two and a half insido. The roasting material is put in a pulverized form into a hopper on top of the furnace, which has in a cast iron hottom three narrow slits. Through these the ore falls upon three grooved rollers, which, on being turned, allow the ore to fall through three small shafts (two and a half feet by two inches), left open in the top wall, into the furnace. Here the free fall of the ore is arrested by three terraces, made out of fire-clay, two and a half feet long and five inches wide. These, after heing covered with ore until the necessary angle is formed, allow the surplus to slide down on both sides. Eight inches lower this is caught again hy six terraces of the same size, from which it falls down upon seven terraces, and so alternatiug upou six and seven until it has passed through all the sixteen rows to the hottom. The whole room occupied hy the terraces is ten and a half feet, the single rows heing eight inches distant from each other. The terraces are arranged so that the ore must slide down both sides of each and fall into two lower ones. The impediments thus put in the way of the free fall of the ore keep it seven to eight seconds in the furnace in a red heat, giving the heat and air time to thoroughly desulphurize it. After arriving at the hottom it is drawn out of an opening left in the front wall.

Next to the perfect desulphurization, the most important item is the circumstance that only for the first heatiug of the furnace is a small amount of fuel necessary. After the red heat produced by the igniting of the ore is once established, the sulphur contaiued in it furnishes all the necessary heat. The movable grate inserted before is then removed, the hottom cleaned, and all openings, except the one left for drawing out the roasted ore and au air canal in the hack wall of the furnace, are shut. The temperature in the furnace, and consequently the whole process, is then entirely in the power of the workman, who, hy increasing or diminishing the speed of the feeding rollers, lets more or less sulphureted ore, and consequently more or less fuel, into the shaft. To facilitate the observation of the process, as well as for the removal of possible obstructions, a hole is left corresponding with every terrace in the front wall of the furnace, which, during the working of the furnace, is closed with an iron lid (or box?). This hox has a small round opening (one inch) in the middle, which is closed hy day aud opened whenever it is wanted for observation or workiug in the furnace with an iron rod.

After the ore has been ignited once, and all the openiugs are closed as before mentioned, the furnace will continue working until some of the terraces or inside walls get damaged. All small particles of ore which, horne along hy the strong draft, pass out of the flue, are deposited in a dust chamber, through which the flue passes into the chimney. The dust chamber has several cast iron slide-doors, by which the course of the gases can he so regulated as not to interfere with the cleaning from time to time while the furnace is in operation.

There being uo work necessary except the filling of the hopper, drawing out of the roasted orc, and observation from time to time, one man can do all the work on a furnace. This, too, is a very important item in Colorado, where wages are exceedingly high.

The quantity of ore to be roasted depends upou the amount of sulphur in the ore; the larger the percentage of sulphur, the smaller is the quantity of ore roasted. Two to two and a half tons is, however, the minimum, with even the most highly sulphureted ores. This seems to be rather slow work, but in reality it is not so at all. The two tons being entirely desulphurized, require mixing with two tons of raw ore, in order to secure a matt hy subsequent smelting. The quantity really furnished for the smelting process is consequeutly four tons—*i. e.*, as much as a common reverheratory furnace will furnish during a well conducted roastiug of twenty-four hours. But even if the quantity roasted was less than in some furnaces, there is another advantage in the perfect desulphurization of the ore. This is the facility it offers in calculating, to the very pound, the quantity of raw ore which is necessary to produce, with the knowu conteuts of copper of the dead-roasted material, a matt of a given percentage of copper. In reverheratory furnaces, on the contrary, roasting goes sometimes too far, sometimes not far enough. In the first case, there are losses by metal going into the slags; in the second, the matt contains too little copper, and wants another coucentration.

Let us suppose, then, the quautity roasted to be four tons and the wages $4 for twelve hours' work. The cost of roasting one ton will then be $2—a figure so low that no other furnace can compete with it, all of them requiring fuel except the English kilns. But these have the disadvantage again of not roasting perfectly and requiring more lahor. Considering all the advautages hrought forth ahove, it must be clear that none of the furnaces existing can compare with the terrace furnace of the American Miniug Company. In order to give a comprehensihle *ensemble* of the inducements offered by its use, I give a short enumeration of all of them below:

1. The cost of building one furnace amounts here (in Colorado) to $2,500; but if several are built at the same time, the cost will be considerahly reduced. The price of materials is: 1,000 common hricks (8x 2½x4 inches), $35 to $37: 1,000 firebricks, $300; cast iron, 25 cents per pound.
2. During the running of the furnace one workman is able to perform all the work.
3. All the sulphur contained iu the ore is removed—an advantage which enables the furnace to be used with great success iu roasting, for the Ziervogel method, which, at Mansfeld, in extracting the silver from a copper matt, requires *all* the sulphur to be previously removed.

(The use of the furnace for roastiug ores for treatment according to this method is the hest testimonial for its perfect roasting.)

4. The process is at any moment entirely in the power of the workman by the slower or faster working of the rollers.
5. The furnace works, without stopping, for years, if the material for building it is good.
6. *All* the sulphur contained in the raw ore is converted into sulphurous acid, and as this is uot mixed with gases originating from the fuel, it can be used with the best possible advautage for the manufacture of sulphuric acid.

The first one of these furnaces has heen built hy me lately at Lyons' smelting works at Black Hawk. A few weeks' working will enable the American Mining Company to give exact results. Many companies are now only waiting for these, to introduce the furnace, which, by its superior advantages will certainly in a short time do away with all others.

The only ores for the working of which it is not fit in its present form, are somo Nevada silver ores, which have to he subjected to a chlorinated roasting. Mr. Charles A. Stetefeldt, of Austin, Nev., has lately changed the form of the furnaco to adopt it to the ahove work, and a very short time will determiue its value for this process also.

A. Wolters.

The Press and the Pulpit.—It was announced some days since that Bigelow had been offered $10,000 a year and some interest in the paper to take editorial control of the New York *Times*. Greeley receives $7,500 for his services on the *Tribune*, and other editors on first-class papers receive from $5,000 to $7,000—only two or three in the natiou receiving so much as $10,000. There are, however, over 100 preachers who receive from $5,000 to $10,000 per annum for their services, and yet they have only to work one day in the seven, while the editor has to work six days. Cousidering the labor there is no comparison in the remuneration. But these matters will in time become equalized.

Glycerine.—Among the uses of this article, which are summed up in long array hy the *Scientific American*, are the following: Tubs and pails saturated with it will not shrink or dry up. Butter tuhs are kept sweet and clean, and can he used a second time. Leather is kept moist and is not liable to crack. Chronometers, clocks and watches are lubricated with it. It is mixed with the water in gasometers to keep it from freczing. It is used for preserving foods, wiues, etc., and in dyeing, and finally for the fearful compound nitro-glycerine; and the half is not told.

What Perseverance will do.—A man who has worked for years in the Brooklyn (N. Y.) navy yard as a machinist, has learned, iu his leisure hours, to speak, read and write Hehrew, German and Italiau, and obtained a thorough knowledge of geology and botany. Out of his savings he has purchased a library of 1,200 volumes.

A Nonagenarian Scientist.—Mrs. Somerville is now ninety years of age. She has this year been awarded the Victoria medal by the Londou Geographical Socicty.

The Quartz Mines of Alturas County.

[Written for the Mining and Scientific Press.]

Editors Press:—While the columns of your valuahle paper teem with information from every mining district of importance ou the Pacific Coast, it has often been a matter of surprise to me to observe that the rich extensive mining region of Alturas County should be almost a "terra incognito" to the great majority of the mining capitalists and quartz operators of San Francisco. Such, however, being undoubtedly the case, perhaps a short notice of a few of our principal mines, and the results of our milling operations, may not be uninteresting to some of your readers.

The Ledges.

The largest and richest of the lodes now being worked is the Atlanta. It has been traced for about 2,500 fect, showing in many places a well-defined fissure vein, varying from fifteeu to fifty feet in width; the inclosing walls and country rock, consisting chiefly of feldspathic granite and syenite, with occasional strata of greenstone porphyry. It is our richest silver-hearing lode, carrying in many places, however, a sufficient percentage of gold to render the hullion worth $8 per ounce. In the claims on this veiu, owned by Messrs. Strode & Co., a large deposit of very rich ruby silver ore has heen struck. The streak is about 2¼ feet thick, lying along the foot-wall of the ledge. It has heen followed for ahout forty feet, and shows every indication of heing continuous. A quantity of ore from this portiou of the vein was purchased hy Captain Kelly for $1 per pound, and he realized handsomely by the speculation. The company have now a fine ten-stamp mill (water-power), four Wheeler & Randall pans, and two settlers. They have lately added two Hungerford concentrators, which work to a charm, and save much finely-divided quicksilver and amalgam.

The Leonora ranks next to the Atlanta in richness. It is owned by energetic men who are good practical miners, doing much of their own work in a quiet unpretending manner, and laying up monthly a large amount of "filthy lucre." The ledge is about six feet thick and is inclosed by a rock resembling closely that of the Atlanta. Assays of ore from this vein, made hy Professor Libenau, have shown as high as $7,000 per ton, in gold. This company has a ten-stamp ateam mill, amalgamating in the battery and on copper plates. They have also in use sluices and blankets and one Hungerford concentrator. Sulphurets saved in this machine were lately forwarded to San Francisco for ameltng. They yielded $625 per tou. The Gray Eagle, Lucy, Hard Times and John Bascom, are all large and well-defined veius. Ore from these mines is being steadily worked in a custom mill on Yuba River, owned by Chesley Woodward, and with generally favorable results.

The supply of wood and water is inexhaustible, and in no instance has ore to be hauled over half a mile to any of the mills. There is a beautiful helt of rich agricultural land on the Middle Boise River, where magnificent crops of hay, grain and vegetahles are raised, at prices but little in advance of those of California. The few men of experience we have had to visit our camp have unanimously predicted a hrilliant future for the Yuba District.

Mining Engineer.

Yuha District, Alturas Co., Aug. 1, '69.

A New Industry—Not Successful, However.—The Sacramento *Reporter* of July 26th, says: "One of our citizens, and late member of the Assembly, lately entered upon an experiment to raise leeches on his premises. To this end he made an excavation on his lot, covered the bottom thereof with gravel, and deposited therein about $60 worth of leeches. In a short time thereafter he discovered that the leeches had disappeared—probahly run themselves into the ground. Their not appearing after his coustant watching, he had been advised to strip himself and go in, and see if he cannot coax them out. Had he gone down to the hardpan, or covered the bottom of his tank with zinc or other metal, he would have probably succeeded iu raising a fine crop.

Salt from Volcanoes.—It is said large amounts of crystallized salt were thrown out at the last eruptiou of Vesuvius, and that scientific bodies are occupied in investigating the cause and compositiou of the crystals.

Mechanical Progress.

Dr. Van der Weyde on Steam Pressure and the Indicator.—In a recent number of the *Artisan*, Dr. V. has an article from which we quote briefly: "It is easily demonstrated that steam engines generally give about all the power their pistons actually receive from the steam pressure; consequently, the greater part of the enormous loss of 85 to 95 per cent. must be in the boilers—much waste heat passing out of the flues; but most of the loss is perhaps due to the resistance of the water itself against its change in molecular conditions, from the fluid state into the state of vapor, while under strong pressure. * * * It is more than half a century since De Pambour proved why, in taking the pressure *in boiler* as the basis of our calculation, we obtain results surpassing the real effective power. He proved that this difference was in proportion that the conducts connecting boiler and cylinder were short or long, so as to present less or more resistance to the steam. He observed that the cylinder could never be as hot as the boiler, which would diminish the pressure as soon as the steam entered the cylinder; also that its pressure on the piston became greatly reduced as soon as this receded before the steam, and for this reason alone must be considerably less than the boiler pressure; that the back pressure, as well as the direct steam pressure on piston, depended also greatly on the nature and condition of the valves, ports, etc.; and therefore, finally, that the only way to be followed for obtaining the true "indicated" horse-power is to use the "indicator."

Balancing Heavy Cylinders.—Exactness can only be approximately attained in practice. The *Scientific American* gives the following method in use by one who has had considerable experience: "The cylinder being keyed upon its axle, as it is intended to run, is lifted by a tackle or crane, and lowered, so that each of its journals rests upon a stout steel straight-edge placed so that its upper surface is exactly level, and parallel with its fellow. These straight-edges should not only be so rigid as to suffer no sensible deflection from the weight of the cylinder to be balanced, but they should be very hard and as smooth as it is possible to make them; and great care should be taken to keep them free from indentations. The journals of the cylinder must also be round and polished in order to secure delicate action. All the friction is thus converted into rolling friction, and this is reduced to a minimum. The cylinder can now be loaded on its lighter side, or *vice versa*, until it will remain perfectly motionless when stopped in any part of its revolution. We have balanced heavy cylinders in this way until they would revolve by placing upon either side one twenty-thousandth of their weight."

Double-Bogie for the Central Pacific Railroad.—*Engineering* for July 16th gives a side elevation of a double-bogie locomotive constructed in England, after Fairlie's plan, to order of the Central Pacific Railroad Company. It has six pairs of 3½ feet wheels, in two groups; each group being driven by a pair of 15-inch cylinders with 24-inch stroke. It has 1,650 feet of tube surface, 125 feet of firebox surface, and a firegrate area of twenty-five square feet. With a mean cylinder pressure of 100 lbs. per square inch, it will exert a pull of nearly 11½ tons. The weight of the engine in working order is fifty-four tons.

Black Lead as a Lubricator.—Van Nostrand says: "Black lead, which has only been used as a lubricator for wooden machinery, is now applied by M. Deloris to every kind of machine, from the heaviest vehicles to the most delicate watch-work, so dispensing with the use of oils and grease of all kinds. It is said to be used with many vehicles in Paris, and in machinery at several factories."

The Closed Hearth in Blast Furnaces. In this system, the *tuyeres* are inserted about nine inches above the scoria outlet, thus bringing the full force of the blast upon the materials. Fuel is saved, and more and better iron produced. The casting may be carried on without taking off the blast, and the "blowing-through" process after every blast, with its consequent waste of heat, is unnecessary.—*Engineer.*

How to Test the Lubricating Value of Oil.—An oil-tester, devised by T. R. Shaw, is thus described in *Scientific Opinion:* "On a vertical shaft fitted in bearings is fixed a disk, on the upper surface of which rests a circular or partly circular block, the two surfaces in contact being finished as true planes. The lower disk is caused to revolve rapidly, the continued rotation of the block being prevented by a cord, one end of which is attached to the side of the block, the other to a spring balance. The block is kept in position on the revolving disk by means of anti-friction bowls. A thermometer is fixed in its center. A small portion of the lubricant to be tested is applied to the disk, the metal block is placed in position, and the lower disk is caused to revolve until a certain temperature which has been fixed upon as suitable for all seasons, as for example 70 Fah., is indicated by the thermometer, when the test of the oil is commenced by noting the frictional resistance indicated on the scale of the spring balance, readings being taken from the scale at intervals during the continuance of the experiment."

The Manufacture of Lead Pipe.—A hollow cylinder is constructed in such a manner as to admit a steel die in one end with an opening of the shape and diameter of the outside of the pipe required. A solid piston or ram fits this cylinder evenly without friction. Attached to this piston is a long, movable "core" or spindle, of the diameter of the inside of the pipe. The cylinder is filled with melted lead, allowed to "set," and the piston pressed into it by a hydrostatic press. When the pressure is applied, the lead is forced forward and out between the orifice in the die and the core, which accommodates its movements to the action of the lead in forming the pipe. Still another and better plan is the introduction of a stationary spindle, which produces a superior and more uniform article. As the lead is forced through the dies in the form of a pipe, it falls over a large pulley or drum, where it is caught by a workman with heavy gloves and guided upon a roll, where it is coiled up and set aside. Lead pipe is pressed out at the rate of a mile an hour. All sorts of bar lead are made in the same manner. The pressure exerted in the manufacture of bar lead and pipes is enormous, varying from two to three tons to the square inch.

Electro-plating of Paper.—The paper is made a conductor by placing it for an hour or two in a solution of nitrate of silver to which liquid ammonia has been added until the precipitate at first made is dissolved. It is then dried, and exposed to a current of hydrogen gas. By this means, the silver is reduced to a metallic state, and the material becomes so good a conductor of electricity that it may be electro-plated with copper, silver, or gold, in the usual manner.

The Management of Safety-Valves.—The necessity of greater care in the handling of safety-valves is thus set forth by the *Locomotive:* "It is the practice of many to lift the valve suddenly, and then let it fall, the spindle thereby receiving a violent blow; and in numerous cases we find the spindle sprung to such an extent by this practice, that the valve can lift but very little, and in some instances not at all. The valve should be raised carefully and let down gently; not only for the reasons above stated, but from the fact that nothing is more dangerous than the sudden shock caused by the valve being suddenly opened and shut. Valves should be frequently raised to prevent their becoming stuck, but too much care cannot be used in the operation. During the month, several cases of this evil have come to our knowledge; in one of which it was necessary to cut the spindle out, after the cap had been taken off."

Zinc Melted in Iron Vessels.—The zinc of commerce contains iron, which it drives from the vessels in which it has been melted. For this reason it dissolves more readily in acid than pure zinc. Dr. Oudemans had occasion to examine a metallic mass that had collected at the bottom of an iron vessel where zinc had been kept melted during the space of many weeks, and which, by its high melting point, had become useless for the purpose of manufacture. The fracture was fine and lustrous, though very different from that of pure zinc,—was much whiter and more jagged. It dissolved in dilute sulphuric or hydrochloric acid with considerable violence, and contained 4·6 per cent. of iron.

Scientific Progress.

The Principle of Life not a Subject of Science.

It is so refreshing,—and, we had almost said, so rare,—to hear truth of the highest order from a French scientist, that we take genuine satisfaction in here giving the closing portion of the address delivered at the opening of the Faraday lectures by M. Dumas. The words breathe the very spirit of Faraday himself; and show that M. Dumas, who has been called the Faraday of France, is fully worthy of the appellation,—inasmuch as he resembles his illustrious namesake not only in his devotion to science, but also in his recognition of the fact that there are truths which, being in their very nature undemonstrable, are not the subject of science, but of faith alone. If it be objected to this item that not being science, it is out of place in a column headed "scientific progress,"—we reply, that to our mind, no proof of such progress could be stronger, than the fact that scientists of eminence are beginning to recognize the infinite as a necessary element in their calculations. Such admission must smooth the way towards the grasping, so far as in man lies, of many a truth which does actually come within the domain of science, but which, without such admission, must forever be to it a stumbling-block and a reproach.

"The chemist has never manufactured anything which, near or distant, was susceptible even of the appearance of life. Everything he has made in his laboratory belongs to 'brut' (raw) matter; as soon as he approaches life and organization, he is disarmed. Thus for a century past, the empirical elements of matter have been recognized and separated; their combinations have been multiplied to infinity; physical forces have been brought back to a common origin—motion—and one has been at pleasure changed into the other; and yet—is the intimate nature of matter known to us?—No! Do we know the nature of the force which regulates the movement of the heavenly bodies and that of atoms?—No! Do we know the nature of the principle of life?—No! Of what use, then, is science? What is the difference between the philosopher and the ignorant man?

"In such questions the ignorant would fain believe they know everything; the philosopher is aware he knows nothing. The ignorant do not hesitate to deny everything; the philosopher has the right and the courage to believe everything. He can point with his finger to the abyss which separates him from these great mysteries—universal attraction which controls 'brut' matter, life which is the source of organization and of thought. He is conscious that knowledge of this kind is yet remote from him, that it advances far beyond him and above him.

"No: life neither begins nor ends on the earth; and if we were not convinced that the real Faraday does not rest under a cold stone, if we did not believe that his intelligence is present here among us and sympathizes with us, and that his pure spirit contemplates us, we should not have assembled on this spot, you to honor his memory, I to pay him once more a sincere tribute of affection, of admiration, and respect!"

Metallic Uranium.—Valenciennes obtained this metal by placing a mixture of chloride of uranium, chloride of potassium, and finely cut sodium in a porcelain crucible, covering it with a layer of dry chloride of potassium, placing the whole in a plumbago crucible, filling the intestines with coke powder, and heating to redness. The metal produced by this process is melted by increasing the heat to a very high point. The uranium is found in a hard black clay, from which it is separated by washing.

Antimony in Galvanic Battery.—The following arrangement is found by Böttger preferable to Daniell's, Minotto's or Leblanche's batteries, as regards both force and durability. Antimony is used instead of graphite. A cylinder of amalgamated zinc is placed in a concentrated solution of equal parts of common salt and sulphate of magnesia; the antimony is placed in a porous cell filled with dilute sulphuric acid.

The Undulatory Theory of Light.

In a recent lecture at the Royal Institution, Prof. Tyndall said that all the phenomena of light are fully explainable by the undulatory theory. "The strength of the theory of gravitation rests on its competence to account for all the phenomena of the solar system. On a precisely similar basis rests the undulatory theory of light, only that the phenomena which it explains are far more varied and complex than the phenemena of gravitation. You regard, and justly so, the discovery of Neptune as a triumph of theory. Guided by it, Adams and Leverrier calculated the position of a planetary mass competent to produce the disturbances of Uranus. Leverrier communicated the result of his calculation to Galle, of Berlin, and that same night Galle pointed the telescope of the Berlin Observatory to the portion of the heavens indicated by Leverrier, and found there a planet of 36,000 miles in diameter.

"It so happens that the undulatory theory has also its Neptune. Fresnel had determined the mathematical expression for the wave-surface in crystals possessing two optic axes; but he did not appear to have an idea of any refraction in such crystals other than double refraction. While the subject was in this condition, the late Sir William Hamilton, of Dublin, a profound mathematician, took it up, and proved the theory to lead to the conclusion that at four special points of the wave-surface the ray was divided not into two parts, but into an infinite number of parts, forming at those points a continuous conical envelope instead of two images. No human eye had ever seen this envelope when Sir William Hamilton inferred its existence. 'If the theory of gravitation be true,' said Leverrier in effect to Dr. Galle, 'a planet ought to be there;' 'If the theory of undulation be true,' said Sir William Hamilton to Dr. Lloyd, 'my luminous envelope ought to be there.' Lloyd took a crystal of Arragonite, and following with the most scrupulous exactness the indications of theory, discovered the envelope which had previously been an idea in the mind of the mathematician. Whatever may be the strength which the theory of gravitation derives from the discovery of Neptune, it is matched by the strength which the undulatory theory derives from the discovery of conical refraction."

Wollongongite. — Prof. Silliman describes in the July number of the *American Journal of Science and Arts* a very remarkable hydrocarbon from Australia, which has recently been received, and of which this is the first scientific mention. It is a peculiar kind of cannel coal, and is found in the Wollongong District of the Illawarra coal field, in what is called the Blue Mountain range. It has been found only in one place, five miles inland forty miles south of Sydney. Its color is greenish black and brownish black. It is sectile, the thin shavings curling up under the knife. The shavings are translucent, and under the microscope transmit amber yellow light. It is readily kindled in thin splinters by a match. Analysis in a platinum crucible gave 82.5 per cent, volatile matter, 6.5 fixed carbon, 11.0 ash. It is exceedingly rich for gas-making; the illuminating power of the gas yielded could be measured only by diluting it largely with common street gas of known power. Prof. Silliman has called it, provisionally, *Wollongongite.*

Nineveh and Genesis.—At a recent meeting of the Royal Asiatic Society, Sir Henry Rawlinson announced that "the progress now reached in the collection and arrangement of the Nineveh inscribed fragments, make it beyond a doubt that they would be able to derive the whole of the history given in the Book of Genesis, from the time of Abraham, from the original documents; and it was not too much to expect that almost the same facts and descriptions would be found in the Babylonian documents as in the Bible. He hoped very soon to have ready a paper on the Garden of Eden, in which he would show that was the natural name of Babylon. The rivers here the very same names, and the Babylonian documents gave an exact geographical account of the Garden of Eden. The Flood and the Tower of Babel would be found to be most amply illustrated in the Babylonian documents."

Farming and Gardening.

How to Make Turkeys Useful.

The French excel all other nations in their management of poultry, especially where large establishments are brought into use. The latest item in this direction which we have noticed is the way they contrive to secure the hatching of the eggs of the *creve cœurs*, a breed of hens but little inclined to set, and poor mothers at best, but excellent layers. The French peasants press into the service for the hatching process hen turkeys. This they do in the following way:

Take a hen turkey of the previous year that has never laid, and put her in a basket containing plaster eggs. Cover this basket with a strong linen cloth. It will be from four to six days before she will overcome her natural disinclination to set, and become attached to the eggs, or, as the French have it, "take an affection for them." When the prejudice is entirely overcome, they place the real eggs under her, she easily covering eighteen or twenty of them. The covering is removed, and the innocent turkey accomplishes the task assigned her without further trouble, save that it is necessary to remove her once a day, that she may partake of refreshment. If this is not done, these "setters" sometimes starve to death, rather than voluntarily leave their charge, so great is their forced affection. After hatching, the little chicks are placed in charge of another turkey, and the mother supplied with a new lot of eggs, continues her mission. These young turkeys are made to hatch three or four "litters" in a season.

"Cancerine" is the name of a new artificial manure, which is now being prepared in large quantities along the shores of Delaware Bay. It is produced from the bodies of a small crab, which is found in immense numbers all along the Atlantic coast. These little fish are first dried and then ground up and packed in sacks for sale. There are places where they can be shoveled up by the wagon load; and it is thought if the onslaught made upon them does not permanently reduce their numbers, the production of "cancerine" can be developed to many thousands of tons annually.

Two Eggs a Day.—Mr. A. Wright, of Fredericktown, N. J., writes to the Farmers' Club of New York that a townsman of his, Mr. Samuel Stanley, has a hen which has been laying two eggs per day for ten days, and both at the same time. One of them is larger than an ordinary one, and the other the size of a quail's egg. This is considered a thing without a parallel, except in the classic literature of old Grimes, where it is said of just such another, "On Sunday she laid three."

Heading-off Grasshoppers.—Mr. W. W. Rnmford, of Tule, Tulare county, in this State, writes to the Farmers' Club of the American Institute of New York that he has devised a method of heading-off the grasshoppers from his trees, which he describes as follows: "Trim the trees up four or five feet from the ground, then put a disk of smooth tin, funnel-shaped, just beneath the lowest branch, large end downward. If the bark of the trunk is tender, protect with matting. The grasshopper does not jump high, but crawls up the tree or stalk of a plant. In this way they will get the top of a telegraph pole. I also have some small trees protected by gauze netting. They rarely injure early sown grain, as it is too near ripe before their advent. I have three trees with heads only twenty inches from the ground, protected by the tin disks, and so far they are safe, although the ground around is alive with the passing horde. I have sat by the hour to see them climb up the tin and then climb down again." It is possible that the above hint may be valuable in many localities on this coast where this terrible pest is working so much injury to our crops and trees.

Pears.—Of the 2,000 and more varieties of pears described and known to those who make pomology a study, only about seventy or eighty are counted as truly valuable.

The Way to Blanket Horses.

But few persons, comparatively, understand how to apply a blanket to a horse to prevent him from contracting a cold. We frequently see the blanket folded double and across the rump and a part of the animal's back, leaving those parts of the body which need protection entirely exposed to the cold.

Those parts of the body of a horse which surround the lungs require the benefit of a blanket in preference to his flanks and rump. When we are exposed to a current of cold air, to guard against any injury from contracting cold, we shield our shoulders, neck, chest and back. If these parts be protected, the lower part of the body will endure a degree of cold far more intense, without any injury to the body, than if the lungs were not kept warm with suitable covering. The same thing holds good in the protection of horses. The blanket should cover the neck, withers and shoulders, and brought around the breast and buttoned or buckled together as closely as a man buttons his overcoat when about to face a driving storm. Let the lungs of a horse be kept well protected with a heavy blanket, and he seldom will contract a cold, even if the hindermost parts of his body are not covered.

The forward end of horse blankets should be made to fit as closely around the breast of a horse as our garments fit our bodies. Most horses take cold as readily as men, if not blanketed while standing after exercising sufficiently to produce perspiration. So long as a horse is kept in motion there is little danger of him suffering from cold; but allow him to stand for a few minutes without a blanket to protect his shoulders and lungs, and he will take cold sooner than men.—*Ex.*

The Yellow Locust.—Hon. T. C. Peters communicates to the farmers club, his experience in raising the yellow locust, as follows: "In preparing the seed I have been in the habit of pouring boiling water upon it, and let it stand twenty-four hours; then drain off the water, and pick out all the seeds which have changed to a whitish color and plant at once in rows in well prepared ground for the nursery. Repeat the operation upon the seed; the second and probably the third time, it will be changed and ready to plant. Care should be taken to keep the plants clear from weeds or grass the first year, and the next spring the seedlings will be large enough for their final transplanting.

An Utah Hybrid Cherry—Something New.—The Mormons of Utah have started a new cherry. It is a cross between the cherry and the wild plum, producing a dwarf tree with willowy branches. The fruit approaches the size of a plum, but retaining the distinct shape and seed of the cherry. It is very prolific, and trees a year old bear fruit. Mr. J. E. Johnson, who writes about it, says that the best plan for making a well-shaped tree is to bud it into the limbs of a two or three year old peach tree, about four feet from the ground, and then clip in the limbs, so that they will not reach the ground with loaded fruit.

Wire Fences, once quite popular at the East, are fast going out of use. One great reason is because animals, particularly horses, often injure themselves seriously by rushing upon such fences unawares. Wire formerly used for that purpose is now in considerable demand for grape trellises, for which it is found admirably adapted. Wire so employed is galvanized and annealed.

Steamed Food for Animals.—A farmer in Massachusetts has tried steaming in his stable for food for five years. He says it costs a third less to winter his cows, and they give a fourth more than when fed on raw hay and grain.

John A. Roebling.—This eminent engineer, who died on the 22d ult., graduated at the Royal Polytechnic School at Berlin, Prussia. The subject of suspension bridges had always engaged his special attention. His graduating thesis was upon that theme; and his fame, which is great and merited, is based upon the works of that description which he has executed in the United States. The Niagara bridge, that over the Alleghany at Pittsburgh, and the Ohio bridge at Cincinnati, are all of his construction; and the projected bridge over the East river, if finished,—says the *Iron Age*,—"will be an enduring monument to his name and fame."

Familiar Science.

How to Look and Appear Well.

Every one likes to appear well; every woman likes to look handsome. Now, it is not the features alone on which we depend for good looks. There are many women, especially, who look handsome, simply because they appear intelligent; and in spite of what nature has done for their features. Good teeth are a help to good looks; they are also essential to good health—hence they should be cared for. A good, clean skin is another aid to good looks; but washing alone will not secure it; neither will painting. Proper food and a healthy stomach are essential. No one can have a fair skin who breathes impure air, especially during the night; hence cool, well-ventilated lodging rooms are essential to this end. But neither features, teeth nor skin can alone make up a really beautiful woman, or good looking men. In order to look and appear to the best advantage we must wake up the mind and soul. The brain must be active. We must think and read—not the trashy literature of the day; but books that call forth thought—that impart knowledge. We must choose for our companions, if possible, those who are our superiors in intellect, from whose conversation we may derive new and advanced ideas. We must attend lectures, such as are instructive and suggestive. In this way the mind will be kept awake, active and healthy, and the dull, sleepy, pensive look, so common among novel-reading women, and idle, listless men, will pass away from the eyes. The countenance will wear a bright, intelligent look, which all admire; and which forms the chief element of what constitutes the really handsome, good looking man or woman. No woman ever looks so handsome, or so really interesting, as when she is engaged in earnest conversation upon some topic which calls out, to the utmost, her thinking powers. Her whole soul is aroused, her eyes beam with intelligence—she is then really angelic. With this understanding of beauty, let us all strive to grow handsome.

Degree of Heat Necessary for Making Bread.—It is stated by Prof. Hosford, and various other authorities, that the degree of heat required for making bread may vary from 220 to 450 degrees. Experience does not sustain this assertion. It has been fully shown that the heat required need not exceed 212 or 240 degrees. When the latter degree of heat has been maintained a proper length of time, your bread will be found thoroughly baked. If it is desired to form a crust quickly, that work cannot be done at less than 350 or 400 degrees; although if a longer time is employed, a lower degree may accomplish the work, but it will be at the expense of driving too much of the water from the dough to make a good bread. Dough may be introduced into an oven heated to 400 degrees, if the temperature is allowed to fall rapidly to 300, and then 250 degrees; but at 450 degrees, the highest temperature named by Prof. H., tin will melt, and any housewife must be aware of the result of exposing a pan of dough for any length of time to such a degree of heat.

Value of Science.—As industry attains higher stages of its developments, as its processes become more complicated and refined, and competition more keen, the sciences are dragged in, one by one, to take their share in the fray; and he who can best avail himself of their help is the man who will come out uppermost in that struggle for existence, which goes on fiercely beneath the smooth surface of modern society.

"The Air we Breathe."—Careful analyses of the dust in the English cities, taken at an elevation of about five feet from the ground, have proven that it abounds with minute animalculæ and vegetable refuse, so light as to float in the atmosphere.

Foreign Substances in the Eye.

Nothing, of a trifling nature, is more distressing to a person than the accidental presence of a foreign substance in the eye. A slight knowledge of the anatomy of the eye will, as a general thing, enable any person so afflicted to at once remove the cause of the trouble. A correspondent of the *Hearth and Home* explains the process as follows: Just underneath the margin of the lid there is a small groove or gutter for the flow of tears to the inner angle of the eye. Foreign bodies tend to fall into this groove, and if they are angular like cinders they adhere in spite of the current of tears which now flow in great abundance, and sooner or later carry off smooth substances. Now if you raise the margin of the upper lid and turn it over, the cinder or grain of sand will be exposed, and may easily be removed with the point of a pencil, or with the finger covered with a handkerchief.

This operation may be performed in the following manner: Take a small pencil, or some similar instrument in the right fingers, and with the thumb and forefinger of the left hand seize the eyelashes of the upper lid and draw the lid gently out from the ball; press the point of the pencil downward, upon the upper surface of the lid, about one-fourth of an inch from its margin, and at the same time carry the margin upward, by the eyelashes, and double it over the point of the pencil. You will then have the little gutter described exposed to view, and in most cases you will find the cause of your trouble lying therein; and from whence it can readily be removed. The operation is perfectly painless, and may be readily performed by any person. It may be much aided by requiring the person operated upon to look downward when the lid is being averted, and upward when the operator wishes to restore the lid.

It is of great importance to remove such substances as speedily as possible, and as, in nearly every instance, such cases arise when no one is with us, it may be well to give the railroader's mode of ridding himself of such an annoyance. The railroadman, when any cinder becomes lodged in his eye, takes hold of the lashes of the upper lid and draws it out, at the same time closing the eye, then, by letting the upper lid go, it falls over the lower lid, when, upon opening the eye, the cinder will lodge upon the outside of the lower lid, and can be wiped off with a kerchief or hand. All this can be done by a person himself even if he has but one hand.

Why can you not light a piece of paper in a lamp chimney? Because of the carbonic acid and vapor of water (steam) which is so freely formed in the chimney. The presence, in any considerable quantity, of either of these substances, would prevent the formation of a blaze, although the heat might be sufficient to char the paper. For the same reason a piece of paper laid flat on a clear fire does not blaze, although it chars. The paper is enveloped in carbonic acid gas, which prevents the approach of the atmospheric air, a condition necessary to active combustion. When you blow the paper, so laid upon the fire, the carbonic acid gas is dissipated, and the paper fanned into a flame.

Cement for Iron and Stone.—M. Pollack, of Saxony, says that for a period of several years he has used, as a cement to fasten stone to stone and iron to iron, a paste made of pure oxide of lead, litharge, and glycerine in concentrated state. This mixture hardens rapidly, is insoluble in acids (unless quite concentrated), and is not affected by heat. M. Pollack has used it to fasten the different portions of a fly-wheel with great success; while, when placed between stones, and once hardened, it is easier to break the stone than the joint.

How to Extinguish Fire in a Chimney. Shut the door of the apartment to prevent a current of air, and throw a few handfulls of common salt upon the fire, which will immediately extinguish it. It neither causes smoke nor precipitates the soot. The philosophy of this is, that in the process of burning the salt, muriatic gas is evolved, which is an extinguisher of fire.

Cider may be preserved sweet for years by being put up in air-tight cans, after the manner of preserving fruit—heated up to the boiling point and sealed. The cider should first be settled and racked off from the dregs; but fomentation should not be allowed to commence before canning.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, August 14, 1869.

Financial.

We are again compelled to chronicle a pinched money market. Coin is scarce and hard to be obtained, even on good security. Immense supplies of grain are coming from farming districts, and accumulating at the various depots inland; but the means for marketing are not here. The stimulus of increased prices in England, while there is little advance upon freight charges, has had slight effect on rates in California, simply because we are without the funds requisite to take advantage of the opportunity. Large amounts of coin have been locked up in real estate, in quartz mills, in new mines, in loans on mortgages, in constructing railroads, and in a variety of other ways. Foreign capital, which was here in large supply, some time since, finding itself underbid, quietly returned whence it came, and the domestic supply is insufficient for our requirements. In addition, the following drains occurred during July: Absorbed in duties, $952,000; personal tax, $250,000; coin shipped, $330,000; interior absorption, $750,000; total, $2,282,000. The Branch Mint gave us $1,500,000, leaving a deficit of $782,000 for the month. Large sums of British capital, on the point of seeking investment in this market, have been withheld from the fear that a greenback currency may be adopted in California—a currency which has been the curse of other States, where they are strenuously engaged in trying to establish their business on a permanent gold basis.

The discount line is very much restricted, and rates in bank are quotable at 1¼@1½ per cent. per month, for first-class securities; second-class borrowers finding limited accommodation at 2@3 per cent. monthly. The demand for bullion is light. Gold bars rule from 800@850; silver bars from par to ¼ per cent. premium; currency bills on Atlantic cities pay 32½ per cent. premium on gold; coin sight drafts are negotiable at 1¼ per cent. premium; telegraphic transfers, 1½ per cent. premium; sterling exchange, 48¾d; commercial exchange, 49½@49⅝d; Mexican dollars bring a premium of 6@7 per cent.; gold in New York, August 12th, 134¾; legal tenders, with us, 73@73½.

Appended is a statement of the public debt, made August 1st, 1869:

Debt bearing interest in coin	$2,107,931,300 00
Debt bearing interest in lawful money	61,810,000 00
Debt bearing no interest	423,372,859 12
Debt on which interest has ceased since maturity	4,790,656 64
Total debt—principal outstanding	$2,691,404,215 76
Accrued interest to date and coupons due not presented for payment	33,718,522 81
Total debt, principal and interest	$2,635,122,738 57
AMOUNT IN THE TREASURY.	
Coin held for gold to Government	$66,415,770 92
Coin for which certificates of deposit are outstanding	35,725,830 00
Currency	23,381,654 29
Sinking Fund in United States coin interest bonds and interest collected and accrued thereon	11,932,147 07
Other United States coin interest bonds purchased and accrued interest thereon	15,110,590 00
Total	$153,556,002 28
Amount of the public debt, less cash and Sinking Fund and purchased bonds in the Treasury	2,481,566,736 29
Amount of the public debt, less cash and Sinking Fund in the Treasury on 1st of July	2,489,002,480 58
Decrease of public debt during the past month	7,435,744 29
Decrease since March 1, 1869	41,896,623 72

The reduction would have been greater had the Government not advanced the interest on the Pacific Railroads bonds, to the extent of $1,636,861, and paid drafts to the amount of $2,500,000 on the last day of July. The price of five-twenties for 1867 appreciated considerably under the action of Mr. Boutwell, and it is very likely that the advance will be maintained. Dealings in sixty-sevens have been on a very extensive scale, in view of the probable future demand by the Government. Tenforties and all other national securities have experienced a corresponding improvement. The malevolent and bitter attacks of which Mr. Boutwell was made the object by Wall street speculators and their hireling satellites are toning down before the numerous and prominent evidences he is steadily giving of a wise, judicious and comprehensive administration of our financial affairs. Nevertheless, there are not wanting those who still revile him with malignity for having choked them off from their expected prey. He has, however, gained the confidence of business men, and is reducing our public indebtedness after a manner which awakens renewed hopes of a speedy reduction in taxes. If the surplus money in the National Treasury should not be used to lessen our public debt, what should he done with it? We learn of no considerable depletion of funds from money centers to move the vast crops now being harvested, which is a certain indication that there is abundant means for the purpose, without crippling the demands from other sources.

Our Branch Mint statistics for July are necessarily curtailed, as that establishment closed on the 10th, to settle its accounts, preparatory to being turned over to the new officers. It will be re-opened on the 14th inst. The coinage for July amounted to $1,040,000 against $2,355,000 for the same month last year, and $1,152,000 for July, 1867. The total coinage from January 1st, 1869, to date, is $6,347,000 against $6,013,000 same time last year, and $9,096,500 for the first seven months of 1867. As the mint was not working, except for ten days, in July, the amount of $1,500,000 was permitted to be drawn from the bullion fund for commercial purposes, refined bullion being, to an equal value, substituted in its place. The bullion fund now contains $2,500,000, inclusive of the $1,500,000 withdrawn, as stated.

Gold bars ranged from 875 to 880 during July. The fact of having enormous quantities of breadstuffs, which are wanted by people who have funds and are waiting to purchase, and still be oppressed by a tight money market, shows an anomalous condition of affairs, and bad financial management somewhere.

The exports of Treasure from Aug. 1st to date have been as follows:

Aug. 4—Per Oregonian—		
To China	$546,973 30	
To Japan	26,404 00	
		573,377 23
Aug. 1 to 5—Overland to New York		68,216 63
Aug. 9—Per Sacramento—		
To New York	$ 48,047 15	
To England	449,887 83	
To Central America	151,625 42	
To Panama	20,000 00	
		679,560 40
Aug. 6 to 11—Overland to New York		86,903 33
Total since August 1st, 1869		$1 502,787 61
Previously this year		24,616,473 70
Total since January 1st, 1869		$25,119,261 31
Corresponding period, 1868		24,839,173 82
Increase this year		$ 280,087 49

City Stocks.

During the past week we note sales of Spring Valley Water stock at $60 50@61 per share.——Over 100 shares of Omnibus Railroad stock realized $69 per share. The usual monthly dividend will be paid on the 16th inst.——The People's Insurance Company disbursed a dividend of1 per cent., on the 10th inst. Sixty shares of this stock sold at $80@81 50 per share.

The Bank of California will pay its customary monthly dividend of 1 per cent. next Monday.

Mining Share Market.

The mining share market does not present any very encouraging features since our last similar reference. Under quite extensive sales of various leading descriptions, such as Savage, Yellow Jacket, Chollar-Potosi and Original Hidden Treasure, prices of the entire list of stocks dealt in show a very marked recession. This condition of the market is mainly attributable to the stringency at present existing in our money market, which will not allow money to be used for mining stock purposes when all available funds are needed for legitimate commercial transactions. True, our advices from the mines are meagre and rather unsatisfactory, but they certainly do not warrant the low rate of prices ruling at this date.

The Assessor of White Pine county, for the quarter ending June 30, 1869, makes the return of the amount of ore reduced and the yield of bullion from the same: Amount reduced, 4,174 tons; yield, $412,814, being equal to nearly $100 per ton. This is the product of 34 mines, the largest yield coming from the Consolidated Chloride, amounting to 931 tons of ore. We can see nothing discouraging in such an exhibit as this. The *News* of a late date says: "The reduction in the rate of wages may now be considered as established. This, it is understood, will be speedily followed by a reduction in the price of milling from $35 to $20 per ton. These very material reductions in the cost of extracting and reducing our ores must ultimately result in the investment of an increased amount of capital in the development of our mines."

The aggregate sales in the San Francisco Stock and Exchange Board during the month of July for the past five years have been as follows:

July 1865	$4,721,193	July 1868	$8,474,998
July 1866	1,558,874	July 1869	5,667,618
July 1867	6,822,200		

CHOLLAR-POTOSI—was in the market to a very large extent during the past week, selling at a sharp recession from closing prices of last week. During the week ending August 6th 1,408 tons of ore were extracted and 1,543 sent to custom mills. Previous week 1,309 tons were extracted and 1,484 sent to reduction works. The ore for the week under review came from the following localities: Blue Wing, 600 tons; New Tunnel, 300; Grass Valley stope, 308. The New Tunnel yielded less than the usual quantity, nor is any increase expected until the main tunnel north is connected with the deposit found on the third floor in the drift running north. No change in the Blue Wing. The Grass Valley stope exhibits some improvement. On the 9th inst. 198½ tons of ore were delivered to seven different custom mills.

HALE & NORCROSS—ruled much lower under considerable sales. For the week ending August 7th the ore yield amounted to 690½ tons, against 743½ tons the previous week. Of this amount the fourth station level furnished 422½ tons. During the same time they delivered 891¾ tons to the reduction mills, leaving on hand 29 tons. On outside dumps they have 1,257½ tons of low grade ore, not taken into the above account.——SAVAGE was very largely dealt in at a heavy decline. The bullion returns for the month of July aggregate $51,000, against $89,500 in June.

GOULD & CURRY—shows a sharp fall from prices ruling early in the week. During the week ending August 9th 377 tons of ore were extracted and 356 forwarded for reduction. Work on the seventh station is progressing finely, the station being completed, and preparations are well advanced for drifting southward.——OPHIR is dull of sale at a decline. The drift has attained a distance of 515 feet.——CROWN POINT was less active than last week, and sold at a heavy decline. An assessment of $5 per share was levied on the 6th inst.——A dividend of fifty cents per share has been payable by the SIERRA NEVADA Co. since the 10th inst.——DANEY and SEGREGATED BELCHER each levied an assessment of $1 per share.——EUREKA (Cal.) disbursed a dividend of $5 per share on the 10th inst.——AMADOR (Cal.) reports a bullion yield of $46,000 for the month of July.——GOLDEN RULE (Cal.) announces its usual sixty-day dividend of fifty cents per share, payable on the 26th inst.

CHINA TO BE EXPLORED.—The *Scientific Review* says that a project for the formation of a society for the exploration of China is being actively promoted in Belginm, with a view to the introdnction in the Celestial Empire of railroads, telegraphs, and the development of its mineral wealth. The project is very favorably viewed by King Leopold, who has traveled in China.

A WORLD'S FAIR at Washington, a year hence, is talked of.

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Aug. 13, 1869.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.		Per ton.
12 per cent. ore	$16 00	22 per cent. ore	$43 56
13 " "	18 62	23 " "	46 45
14 " "	21 20	24 " "	49 33
15 " "	23 25	25 " "	52 22
16 " "	26 22	26 " "	55 11
17 " "	29 12	27 " "	58 00
18 " "	29 91	28 " "	60 80
19 " "	34 90	29 " "	63 77
20 " "	37 78	30 " "	66 66
21 " "	40 87	31 " "	69 55

These prices, we believe, will be found substantially correct, and can be realized at this date.

New Books in the Mechanics' Institute Library.

The following works have lately been added to the Mechanics' Institute Library: Todd's Cyclopædia of Anatomy; Owen's Odontography; Owen's Palæontology; Hassall's Adulterations of Food, etc.; Max Müller's Lectures on Language; Lyell's Antiquity of Man; Tyndall's Glaciers of the Alps; Murchison's Siluria; Darwin's Animals and Plants Under Domestication; Mill's Analysis of the Human Mind; Laycock on Mind and Brain; Autiquity of Intellectual Man; Lecky's European Morals; Man and His Relations; Descriptive Ethnology, by Latham; McCosh on Typical Forms and Special Ends; Elements of Comparative Anatomy, Huxley; Draper's Anatomy, Physiology and Hygiene; Argyll's Reign of Law; Whewell's Novum Organon Renovatum; Whitney's Study of Language; Frost and Fire; Froude's History of England; Admiralty Manual of Scientific Investigation; Lownde's Bibliographer's Manual; Bibliography of Early English Literature; Craik's English Literature and Language; Wilson's Digest of Parliamentary Law; Roscoe's Spectrum Analysis.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Tarshish.—*Miner*, July 31st: We have assurance from Mr. Schwerin that though he now does not expect to start up before September 1st, it will not be later than early in October.

Globe.—More than usual interest is manifested in this work. A number of quartz feeders have been recently cut, all showing ore to the eye and assaying flatteringly. An experienced mine "captain" is expected here next week to take charge as foreman. A mill of 25 tons capacity will next month be put up.

Mountain.—Mr. Ray will put on an increase of force next week and push the cut across the lode. The rock looks well and the lode promises to be huge.

The boulders all over and through the soil to the bedrock on Boulder Hill, it is thought, will pay to assort for the mill, and parties are now at work.

Four men working on the Leviathan and good ore coming out.

Pennsylvania.—*Chronicle*, July 31st: The mine is looking well. The south drift is in solid quartz and paying ore, over six feet in width. The permanency of this mine is now beyond question.

BUTTE COUNTY.

Specimen Brick.—Butte *Record*, Aug. 7th: Mr. Slater, of the Trojan mill, near Enterprise, was in town on Wednesday, with a specimen brick of 40 ounces. These bricks are the result of two weeks' run, and do not vary in weight more than an ounce or two. The ledge is a steady paying one, yielding a profit of seven or eight hundred dollars per month to its owners.

Mountain Spring House.—A correspondent says: The miners in this section are already preparing for another season. At Upper Cascade (Drake's), they are working ten or twelve men, extending their ditch to Pinkard's, and building reservoirs. At Lower Cascade, ten or fifteen men are blasting down the falls to drain the valley. Moore & Co. have several men at work whip-sawing, digging ditches, and finishing a large reservoir, that will cover some 10 or 15 acres.

CALAVERAS COUNTY.

Petticoat.—*Chronicle*, Aug. 7th: A very rich lead of gold bearing quartz has been struck, during the past week, in the Petticoat mine at Railroad Flat. It is upwards of 8 ft. in width.

More Rich Rock.—Thirty-two tons of quartz from the "Bald Eagle" claim at Independence, owned by Gamble & Co., yielded over $1,500, as per assay.

Union Shaft.—Next week the Company will commence cleaning out and retimbering the old diggings preparatory to taking out gravel.

Golden Gate.—James Gleason has assumed control of the claim and commenced freeing it of water and getting it in condition for working.

Big Lump.—We were shown this week, a *chispa* of pure gold, weighing half a pound. It was taken from the Mokelumno by a Chinese company.

Copperopolis.—Letter to Sonora *Democrat*: The "mother vein" is here from 3 to 40 feet in width. At present there are two arastras running, on separate lodes; one owned by Tulloch & Co., the other by Davis & Co. The first have completed the grinding of a ton of rock which gave satisfaction, and has inspired them with confidence to erect a 10-stamp mill. The lode has been traced from Hunter's Valley on the south, to lone on the north, and prospects well throughout. The lead owned by Tulloch & Co., assays $4,100 per ton.

EL DORADO COUNTY.

Want of Water.—Placerville *Democrat*, Aug. 7th: At Gold Hill there is barely sufficient water for irrigating purposes, and the miners had to cease work. In our immediate vicinity there is not sufficient for the claims already opened, to say nothing of the great number that cannot be worked until a supply can be had.

LOS ANGELES COUNTY.

Soledad.—Correspondence Los Angeles *News*, Aug. 7th: Everything is moving along slowly and quietly, but sure. Although there is but little said on the outside about these mines, I am certain that they cannot be surpassed in extent and richness by any in this State. Yesterday the Eureka Co. cleaned up, after a run of 50 tons of rock, $1,295. The Co. is running a 10-stamp mill (water power); but owing to the scarcity of water are using from four to five of the stamps. Mr. Hayward, who is now here, in conenrrence with the rest of the company, has decided to erect a 10 stamp steam mill immediately. The Eclipse, owned by the same company, is not being worked, simply because the Eureka affords more rock than one mill can crush. There are many mines that, owing to the scarcity of cash, the owners are unable to open. We have the Champion, four feet wide, and cropping out for 1,000 feet, which yielded $10 per ton without assorting. Messrs. Serles & Yates crushed 100 tons of it at their mill with the above result. The extension of the Eureka, known as the Young America, crops out 500 feet, and has the same rock as the Eureka.

Rich Discovery.—Mr. Wm. Brown has discovered, near the summit that divides the plains of the Mojave from those of Los Angeles Valley, a vein of argentiferous galena ore, rich in silver, 20 feet wide, outcropping a great distance, with wood and water inexhaustible. In running a tunnel 800 feet, the vein can be struck 1,300 feet from the surface, and there are tons upon tons of ore upon the surface that would afford profitable employment for a furnace without sinking a foot upon the vein.

MARIPOSA COUNTY.

Sebastopol.—*Mail*, August 6th: John Snow informs us that he is drifting in his quartz claim, with flattering indications.

NEVADA COUNTY.

McClellan Mine.—Grass Valley *Union*, Aug. 4th: The George B. McClellan mine is about one mile and a half south of the Banner. The owners have a perpendicular shaft down 56 ft. There is ledge space of six feet between the walls and the quartz is, on an average, two feet thick. The ledge carries a large amount of metal, and the sulphurets are rich in gold. Steam hoisting and pumping works are now being erected.

Weekly Mining Review.—Same, 8th: Empire is opening a new level 1000 ft. down the incline. The ledge is two and a half feet thick. The new incline is down 230 ft. A building is going up over the new shaft....North Star will probably resume work on Tuesday. The mine is free from water....From Union Hill mine, gold to the value of $8,500 was brought in yesterday, which with a former clean up gives $12,000 for a month's run of the mine and mill.] The earnings of the mine are now devoted to development....The Idaho is in a prosperous condition.....William Penn is idle. Arrangements for heavier machinery are being made....The Wisconsin will put up 8 stamps forthwith. A clean up yesterday from 170 loads of rock gives $5,100 or $30 to the load.....The gravel claims of the Messrs. Brown, on Squirrel creek, have paid $8 per day to the hand, for every working day in the Winter and Spring. Water fails in the Summer.....The shaft on the West Eureka ledge is down 64 feet. The walls are well defined, and the crevice three feet wide....The deadest looking part of this district is Massachusetts Hill and Scadden Flat. There is idle machinery on the hill, and the claims on the flat are untouched. No one doubts the richnes of the ore in hill or flat; but consolidation of interests must be effected before the rust will be rubbed off.

....At the Allison Ranch mine, work is being prosecuted in setting up the pumping machinery at the old shaft. Until this pump is in place, the water from the lowest level, 465 feet, cannot be drained. In the meantime from the Carriboo, rock of exceeding richness is being taken. Twenty-four tons was crushed and cleaned up this week, yielding $200 per ton, independent of the sulphurets.

Good Clean Up.—10th: The clean up from Joseph Perrin's quartz mine, on Wolf creek, below Forest Springs, on Saturday, from 68 loads of rock, was $2,800.54, or a fraction over $41 to the load.

Good Rock.—*National*, 5th: A crushing was recently had at Stiles' mill, from the Mount Vernon mine, of ten tons of rock, averaging $31.37½ per ton.

Schuylkill.—9th: On Saturday a contract was let to John Farrell & Co., to run 30 feet for $16.50 per foot. The ledge is from six inches to three feet thick and prospects well, the rock showing free gold and an abundance of rich heavy sulphurets.

The Banner Mine.—*Transcript*, 7th: For some time past the company have been engaged in opening new levels and sinking the incline. They are now down 640 feet, and have so near completed their work that some time next week they will be ready to put on a full force of men. The number employed under ground will then be 60, and the entire number 100 or more. The mine, we understand, is looking first rate.

The Burns' Process.—Same, 8th: We understand that the funace at Meadow Lake, erected for the purpose of testing the Burns' process, is about completed, and that work will commence upon the rock on next Monday morning. The process, on a small scale, has proved good, and it only remains to test it in the working of large quantities of ore.

Lecompton.—*Gazette*, 4th: Mr. J. J. Ott, the principal owner of this mine, has had men employed for two weeks in reopening the ledge. Where they are now at work the vein is about a foot in width, and the ore very rich. In the course of a few weeks, it is the intention to put on a force of 20 men.

PLUMAS COUNTY.

Mills and Ditches.—La Porte *Union*, July 31st: There are 26 quartz mills in the county, carrying a total of 300 stamps, and have cost nearly a half million of dollars; there are 140 miles of water ditches, which have cost nearly an equal amount.

Crescent.—The last shipment of bullion was nearly $9,000.

SIERRA COUNTY.

Alaska Mine.—Correspondence of the *Appeal*, Aug. 2d: The Alaska, near Pike City, four miles from Camptonville, is yielding rock of unexampled richness. The extraordinary character of the ore recently worked may be estimated when we state that with a battery of only five stamps, running half the time, and with no appliances whatever for working sulphurets or blanket washings, the company have been enabled to declare dividends during the past three months amounting to $30,000. Less than six months ago this property was offered for sale at a sum not exceeding the dividends above named, to certain parties professedly anxious to buy, but who, fortunately for the owners, were too slow, or too tender-footed.

SISKIYOU COUNTY.

Oro Fino.—Correspondence of the Yreka *Union*, Aug. 7th: Most of the miners, water having failed, have gone to work in the harvest fields. Trimble & Co. are building a 10-stamp mill at their ledge in Hull's Gulch, near Mugginsville. This lead has prospected as high as $250 per ton. The company has incorporated with a capital stock of $50,000, with 1,000 shares of $50 each, which they propose to sell at $10 per share, assessable once a month at $1 per share; thus obtaining funds to build the mill and open the ledge.

Letter from Scott Valley, says: Squire Steele's new engine for pumping water and raising dirt at his claims on McAdam's Creek, has arrived, so that we may expect to hear of big strikes in the Steamboat claim. The gold is there.

TRINITY COUNTY.

Canyon Creek.—Letter to the *Journal* of 7th: "All the old claims along the creek are paying more or less. S. Obermeyer, John A. Berger, and the Baumgartner Brothers are doing well. Conrad Dannenbrink has a good claim. John Bolz is a farmer and miner. Doctor Rollin Smith and P. O. Grant are opening a new claim, and will do well."

TUOLUMNE COUNTY.

Golden Rock Ditch.—Sonora *Democrat*, 7th: The iron pipe across the Big Gap, formerly spanned by the suspension flume, is completed, and the water reached Big Oak Flat on July 30th. The entire section of country watered by the Golden Rock Ditch, can now expect a restoration of that prosperity enjoyed before the fall of the big flume. Mr. Rocca informs us that the pipe is 22 inches in diameter, 2,262 feet in length, and sustains 215 feet dead pressure. Probably the greatest bed of auriferous gravel in the Southern mines is covered by this ditch. Gravel Range has a length of eight miles in this county and four in Mariposa. It varies from one to two miles in width, and will average at least 50 feet deep. The course is N. W. and S. E. The labor necessary to open claims caused it to be neglected, when gold was laying around loose in the ravines and gulches; but for a year before the fall of the flume, work was being prosecuted on several claims. If those claims prove remunerative, and it is believed they will, that section will be the most prosperous in the Southern mines. Nor are the diggings wholly exhausted around the Garrotes, Deer Flat, Oak Flat, Spring Gulch, Moccasin Creek, Pino Blanco, and Horse Shoe Bend, all of which places are supplied with water by this ditch.

Richmond.—Correspondence of Same: The U. S. Grant mill, above American Camp, will be ready for crushing this week. The splendid hoisting works have been in full operation for the past two months, and the miners have been getting out rock which is rich. T. C. Clark, one of the owners, tells me that said rock will average $572 per ton. It assays over $3,000. Works will be erected for roasting the ore. Nearly $40,000 has been expended so far upon the mill and mine. Thirty men are employed.

Arizona.

Independence.—Prescott *Miner*, July 24th: Theodore Boggs arrived here this week from the Independence mine, with $225 in gold amalgam, which he got out of 2½ tons of ore arastraed by him.

Last week, Charles Otten and partner rocked out about $60 in gold dust, in a ravine near the Chase mine. One piece found by them weighed nearly $13.

Colorado.

Incas and Bullion Consolidated.—Central City *Herald*, August 4th: Mr. W. Rockwell, agent for this company, has been driving a tunnel into Fletcher Mountain, near the head of Black River, and has reached a point 600 feet from the surface. To strike the lode will require a tunnel at least 1,200 feet long. He has made a contract with Severance & Hall, of the Diamond Hill Company, New York, to bore a hole two inches in diameter and 800 feet long, beginning at the end of the tunnel. The machinery will be put in position in September. The work can be performed in 80 or 90 days.

The Wilson Steam Stamp Mill.—This mill, on the Cleveland lode, Trail Creek, does its work in a very satisfactory manner. It will crush two cords of ore in 24 hours, using one cord of wood. The ore will, it is claimed, yield $100 per cord.

Hoosier.—Boulder *Pioneer*, July 28th: Yesterday the miners struck upon a mass of wonderfully rich ore. The vein shows three feet, and is permeated and spangled for its entire width with wire silver (native). Thin flakes of this precious metal, some of them as large as the palm of a man's hand, are found in the seams among the ore.

Smith & Parmalee Mill.—The *Register* says: "Mr. Wells showed us a fine retort last evening, weighing 102¼ ounces, the result of last week's run of the Smith & Parmalee mill. The gold is very fine, and sells for $23 per ounce, currency, making $2,357.50 as the earning of the mill one week."

Idaho.

Fine Specimen.—Owyhee *Avalanche*, July 31st: We were shown by Mr. C. S. Peck, of the Potosi Company, a specimen of gold bearing quartz taken from the bottom of the shaft in the Potosi mine, which was literally full of "wire gold" running through every particle of it.

Placers.—Messrs. Angell, Bailey, Dolherg and others have, in anticipation of the new ditch, located placer claims on the side of Florida Mountain, which have been prospected with gratifying results.

Poorman.—At no time for the last two years has this mine shown better than at present. The ledge is widening and the ore getting better.

Empire.—Judge Robertson has sunk a shaft 18 or 20 feet deep on the third extension of the Empire, and has developed a fine looking ledge from 18 inches to two feet wide. Free gold is visible all through it.

Bullion.—Same of 7th, Aug: Amount of bullion assayed in Silver City, as returned to Assistant Revenue Assessor for Owyhee County, for the year ending June 1st, $1,590,378,36.

Bullion for July.—*Ware*, August 3d: Shipment per express from Silver City, nearly $97,000, currency.

Nevada.

COPE DISTRICT.

Miners' Meeting.—Elko *Independent*, August 7th: The meeting held on July 31st voted that placer claims need not be worked until May 1st, 1870; and that bar or bench claims shall be 200 feet front and run back into the bar or bench 400 feet.

Several gentleman returned from Cope within the last three days. They all speak highly of the appearance of the ledges that are being worked and of the reports about the placers. Arrangements are being made to bring in water to Mountain City, and several companies are making preparations to go to work as soon as the water comes.

The Silver City *Ware* of 6th says that several townsmen have returned from Cope and report favorably.

HUMBOLDT.

Unionville.—Letter to *Independent* of 4th: The miners' strike which occurred here about three weeks ago has about ended, and the mines are driving away as usual, mostly, however, with new sets of hands working ten hours a day, as de-

manded by the compromise. Evans & Co's new mill has reached Mill City, and will be brought up and put in place as speedily as possible.. At present it will be prepared to work only gold rock. In the Silver M. Co's ground a body of ore, described as the finest ever cut on the Arizona Mountain, was cut yesterday at the extreme southern end of the works, where the lode is about five feet in thickness between eastings; nearly the whole consisting of splendid ore, much of which will yield at least $1,000 per ton.

REESE RIVER.

From Mineral Hill.—*Reveille*, August 7th: Several of our citizens have returned. They represent the camp as being lively, though very little has been done as yet towards developing any of the mines. A good deal of rock is on the way to Austin to be worked, and a good deal more is piled up ready to be sent. All of this, however, is surface and float rock, large quantities of which were available. No substantial buildings have as yet been erected.

Reveille District.—Letters to the *Inland Empire* give the names and present condition of a number of ledges. We clip the following from the summing up: "The undeveloped condition of this district, so rich in mineral wealth, arises from the want of proper mining and milling facilities. There is not a single company that has one establishment for convenient working, and most of them are too poor to so establish themselves. Water enough can be concentrated in the town with proper effort to run a 10-stamp mill; though Lambert & Co., for the Buckeye Mill Co., have abandoned the plan, after a feeble trial, and are putting up their mill at Brobanet's place, 12 miles distant, where there is plenty of water. * * Most of the miners are poor, and will sell their mines at comparatively low figures. In viewing these three mountains of mineral wealth, with all the surrounding circumstances, I cannot but think it the most available place in the State for San Francisco and Chicago capitalists to invest a little of their surplus funds."

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

Mill Burned.—*Enterprise*, 6th: Yesterday, about noon, Weston & Co's water mill, on Gold Cañon, below the Sacramento mill, was destroyed by fire. The mill contained 10 stamps, and originally cost about $25,000; but when burned was probably not worth more than $10,000. The mill has not been running for some time. The steam mill belonging to the same parties, some 50 feet distant, was saved.

Imperial-Empire.—8th: The shaft is being repaired, and will be all right in three weeks. Some ore is coming from the upper levels.

Overman.—This mine is yielding about 30 tons per day of ore, worth $20 per ton.

Kentuck.—The Kentuck is yielding about the usual amount of milling ore from the upper levels, with excellent prospects on the 900.

Belcher.—A drift was commenced yesterday to connect with the 900-level of the Crown Point. The communication between the 850 and 730-foot levels was completed day before yesterday.

Yellow Jacket.—There are still about 75 feet of water and 30 feet of mud in the old north shaft. Some excellent deposits of ore have been developed on the 800 and 900-foot levels. In the south mine the air is good, and the usual quantity of average milling ore is being taken.

Hale & Norcross.—This mine is being vigorously worked. Prospect-drifts are being run in all directions, and shafts are being raised from level to level. These have developed many new and excellent bodies of ore, and have greatly increased the circulation of fresh air.

Occidental.—The new tunnel is now in 1,000 feet. Milling goes on as usual, as they were not running their water mill at the time it was burned down.

Sierra Nevada.—The mill is running constantly, and the ore is of the best quality. Their last run yielded $11,000.

Chollar-Potosi.—This mine is yielding some 250 tons of fine milling ore per day, principally from the Blue Wing level.

Gould & Curry.—They are taking out about 40 tons of ore per day, assaying some $45 per ton. The total yield of bullion for July was $36,217.18. The drift east through the ledge is progressing satisfactorily.

Items.—Same of 10th: The Sierra Nevada Mining Co. have declared their third monthly dividend of 50 cents a share on the new issue, aggregating $7,500, payable to-day.....An assessment of $1 per share was levied on the capital stock of the Segregated Belcher last Saturday, aggregating $6,400, and delinquent September 9th.... The annual statement of the Yellow Jacket shows the indebtedness of the company to be $251,000. The present assessment, when collected, will be $240,000.

The *Herald's* Virginia City correspondent says,—11th: "The mines along the Comstock were never worked to better advantage as far as this side of the divide is concerned. Those at the Gold Hill end have a damper thrown on them by the continued disability of the Crown Point, Yellow Jacket and Kentuck on account of the fire, which still burns within their depths; yet they, in the course of a few months, will recover even from that terrible blow. North of the Gould & Curry the lodge may be set down as dead and expensive property, except in the case of the Sierra Nevada mine, which is one of the best paying of any on the whole ledge, and is worked at the least cost."

WHITE PINE.

Mining Review of the Week.—*News*, Aug. 7th: "Owing to the strike against the reduction of wages, and the lawless proceedings of the Miners' League in forcibly ejecting workmen from some of our mines who were working at the reduced wages, the operations of some of our principal mines have been seriously interrupted during the past week."—[We gave the substance of what immediately follows, in an editorial note last week, the news having reached us by telegraph.—Eds. Press.] "Nevertheless, our bullion shipment for the past week amounts to $48,585.76, being an increase of over $8,000 above the shipments last week. We have no report of yesterday's shipment, if any was made. * * The Executive Committee, backed as they are, by the determination of our citizens to see the perpetrators of such outrages as those of last Wednesday morning severely punished, will without doubt be able to protect all miners willing to work for a fair compensation, and all other citizens in the exercise of their rights as freemen. The reduction in the rate of wages may therefore be considered as established. This, it is understood, will be speedily followed by a reduction in the price of milling from $35 to $20 per ton."

Items.—*News*, 3d: Liberty mine has struck rich chloride at 31 ft....4th: The Earl has sent 130 tons of ore to mill, and has about 30 tons left at the dump. But four tons of waste was taken out with the 160 of ore, and millmen offer $10 per ton for the waste. Pulp assays of the ore milled give an average of $310 per ton.... 5th: Eastern Slope tunnel struck quartz at a depth of 160 ft. The tunnel is in 230 ft. ....Several mines in the vicinity have recently been sold in New York....Fourteen tons from the South Metropolitan recently worked over $100 per ton. The ore improves as the shaft descends....Very rich ore at a depth of four ft., in Treasure Hill Consolidated shaft....*Empire*, Aug. 1st: The Earl has again been compelled to suspend operations. The Consolidated Aurora folks have sprung another title against it and yesterday a restraining order was issued out of the District Court. The Aurora has purchased the Colfax claim, at a cost of $12,000, and now propose going after the Earl....6th: We were shown yesterday two average assays of ore from a new mine on Mount Ophir, one running nearly $500; the other over $1,100 per ton....Eberhardt started up yesterday....The California did the same, with full force of men.

Bullion Hill.—*Empire*, 6th: The Bullion Hill Co. have now on grass 125 tons of ore which it is believed will mill $300 to the ton—the average assays running from $500 to $600. A quantity already reduced yielded at the rate of $1,100 to the ten, producing bullion of unusual fineness even for this district. The Bowie & Brown mine have on the dump 20 tons of ore that will mill $150.

Mills and Smelting Works.—*News*, 5th: The Metropolitan mill is constructing a spacious ore-house....A 10-stamp mill was shipped last week from San Francisco to Robinson District....A smelting furnace, capable of reducing 25 tons per day, is to be erected in Robinson District immediately....Joe Trench contemplates the erection of a mill for the Ophir Hill mines. ....*Empire*, Aug. 1st: Five loads of machinery for Col. Page's mill arrived in this city yesterday. The mill is brought from Belmont, and is to be put up in or near this city. It will run 20 stamps, and is new from stem to stern....The Aurora Consolidated Mining Co. contemplate the immediate erection of a 20-stamp mill at Shermantown....4th: The framework of the Stanford mill is up. It will probably steam up by September 1st....7th: The Treasure mill (Big Smoky) has turned out during the last fourteen days $40,000 in silver bricks, and it is expected to do still better for the next two weeks. It is now running on ore from the company's mine on Treasure werth $1,100 per ton.....8th: The Newark mill was yesterday shut down for repairs. It is expected to be ready to steam up again about the last of the present week. ....Jordan's Smelting Works at Swansea will go into operation to-morrow....*Telegram*, 4th: The Metropolitan mill is crushing third-class ore from the Post Hole mine on Chloride Flat. The Moyle mill started up to-day on ore from the Consolidated Aurora.

Mosheimer's Smelting Works.—*Empire*, 3d: Mr. Mosheimer has now one furnace running, of the capacity of eight tons per day, and will soon add several others. Everything there seemed working nicely, and we predict that before many years the great bulk of the reduction here will be by smelting. The blower of the furnace is run by a Hick's engine, a most unique invention.

Quarterly Proceeds of Mines.—*News*, 6th: We are indebted to Augustus Ash, the County Assessor, for the following statement of the quantity of ore crushed, the amount of bullion yielded and the amount of the tax thereon, for the quarter ending June 30th: Ore reduced, 4,174 tons; total yield, $412,814.19; amount liable to tax, $341,343.37; amount of tax, $11,093.65. It will be seen from the above figures that the average yield of all the ore crushed in White Pine County during the months of April, May and June was a fraction less than $99 per ton.

Stamps Running.—The *Alta's* Hamilton correspondent writes, Aug. 3d: Eleven mills have now 116 stamps running. "Add to this the 20 stamps of the Newark mill (the Centonary,) now running on White Pine ore, and you have 136 stamps in operation. Then we have the California mill of 20 stamps, Dayton of 20 and Monte Cristo of 10—in all, 50 more stamps nearly ready to run. By September 1st the number of stamps available for reducing the ore of this district will be 186."

Montana.

Elk Creek.—*New Northwest*, July 30th: Sexton & Co., Dugan & Co., and Stone & Co., are each working four men on their bedrock flumes, and taking out about $500 each per week on an average. Jones & Co. struck pay ten days since. This company have been two years and a half in running the flume, which has cost $8,000 or $10,000.

Lincoln Gulch.—There are some 200 men in the vicinity. There is 200 inches of water in the ditches, and the new one will supply 100 more. Everything is prosperous.

Highland Gulch.—A correspondent says: "The fluming companies are all in a flourishing condition. Prof. Swallow's mill is nearly in order, and will soon commence crushing from the Forest Queen. We were shown a beautiful specimen of retort gold from the Nonpareil lode."

Mr. Wm. Flowers' arastra in Highland Gulch makes gratifying returns. He uses a piece of Brussels carpet below the blankets. From this he cleans up an ounce per day that has passed over the plates, riffles and blankets.

Hot Spring District.—Virginia *Republican*, July 30th: Hall & Spaulding's mill is crushing from the Mother Hendricks' lead, 20 tons per day, which yields $20 per ton. Mr. Appleton has the Hobart mill employed in crushing quartz from the Galena lode at Sterling.

Argenta.—We learn that the Cable lode is being rapidly developed by a double shaft, day and night; that between 200 and 300 tons of ore are now ready for the furnace. The crevice is between six and eight feet in width, and rapidly running into carbonates much richer than the top ore.

Washington Gulch.—Last fall, William Parkinson purchased an interest in some bar claims for $900, secured a good supply of water to work the same for three years. He is now realizing 15 ounces coarse gold, to four hands, ground sluicing.

Bivens' Gulch.—The miners have introduced water through a ditch which they have made from the head of Granite Creek, a distance of five miles.

New Mexico.

Grant County.—*New Mexican*, July 24th: Mr. Hudson writes: "Messrs. Milby & Backus have struck some very rich quartz on their lead (Pacific No. 2). It is so rich that they have taken from some of the rock, pounded in a hand mortar, from $100 to $200 per day. Day before yesterday, Langston, McGee and Hart found another lead near the one they have been working from which they have taken, with the aid of a hand mortar, about $1,000 of gold in a day. The quartz found by Langston, McGee and Hart paid as high as $50 to the pound.

Oregon.

Lewis River Mines—Dalles *Mountaineer*, July 30th: We learn from Vancouver that a great excitement is growing up about the lately discovered mines on the headwaters of Lewis river. Several of those who went out last week have returned, reporting that they found prospects ranging from one to fifty cents to the pan. They have gone back with better outfits. Everybody is getting excited, and several hundred men will be in the new mines within a week. They are 50 miles from Vancouver.

Bohemia District.—The Eugene *Guard* says: "Several gentlemen left here yesterday for Bohemia. If they can get a road to the mines they are going to take a five-stamp mill in this season.

Burnt River Ditch.—The *Herald* says: "McCoy designs putting from 400 to 500 men on the work and rush it through at once, taking from here some 200 Chinese and obtain the balance up there—opening up the richest and most extensive mining creek north of the California line.

Sheffielders in Connecticut.

Two intelligent Sheffield workmen, who have been employed for some time in a cutlery manufactory in South Meriden, Conn., write to *Ryland's Iron Trade Circular*, to warn their countrymen "not to act rashly on the strength of pictures drawn by interested parties to induce them to emigrate." We quote a single paragraph, which indicates the especial peculiarity that catches the eye of an English artisan in an American establishment:

"The shops where the work is done are of a widely different character from those of home. They are generally built of wood, as are most buildings in this country, excepting in the large cities. They are, as a rule, roomy, light, and well ventilated. They contain a much greater amount and variety of machinery than can be seen in a Sheffield cutlery, machines being substituted for almost all laborious hand labor. Many of these labor-saving contrivances are exceedingly ingenious, and it is very interesting for a Sheffield cutler to go round and see the many easy ways there are of doing the same work quicker and better in many jobs at the making up of a knife through the application of a simple mechanical contrivance. There is, too, a much greater division of labor than at home. Work is mostly given out to bosses or contractors, each of whom does a specified part of the work, passing it on when done to the next, making an ordinary ivory table-knife to pass through the hands of about sixteen bosses. This system of dividing work admits of the employment of a great quantity of unskilled labor, and does away, to a great extent, with the necessity of high-skilled workmen."

Hell Gate.—Various complicated inventions have been got up for the removal of the obstructions in this passage; but all have lacked something. Major General Newton,—says the *Times*,—has decided that the first thing to be done is to clear away the reef opposite Hallett's Point, between the Gridiron Rock and the point where First street, Astoria, reaches the Hell Gate water. To create a channel here for large vessels necessitates a cutting down, vertically, of from seven to eighteen feet from the summit of the reef. The plan proposed is to sink a shaft in Astoria at a proper distance from the Hell Gate easterly shore, and, after reaching a sufficient depth, to tunnel laterally under the roof, and then explode the rock by means of either nitro-glycerine or gunpowder. This, of course, will bring down the rock from its present altitude, causing it to fill the tunnel that will have been run underneath it. The explosion will also break the rock into masses sufficiently small to admit of their being handled with facility, and removed by means of a derrick, or some other arrangement, at any place where the projecting points may be more than will allow a run of twenty-five feet of water in the clear. This plan, which is General Newton's own, seems to be perfectly feasible.

Steel Rails.—The New York *Express* states that the Hartford and New Haven Railroad have ceased laying steel rails because they make the track too unyielding, and are now putting down new iron rails.

MINING AND SCIENTIFIC PRESS.

San Francisco:
Saturday Morning, Aug. 14, 1869.

Notices to Correspondents.

Woodman.—The horse chestnut is a noble and picturesque tree when full grown, and in the spring or flowering season presents a particularly beautiful appearance. The nuts are composed chiefly of starch, cellulose and caseine, with a little oil and mucilage. The shell of the nut, the leaves and the bark, contain tannin and coloring matter. In Switzerland, the nut is used to feed sheep; pigs will also eat them. The color imparted by the leaves, shell or bark, according to the strength of the infusion, imparts to silk and cotton a good durable brown or yellow. In France, the nuts are ground into a fine flour and mixed with water to the state of an emulsion, and in this form used in the manufacture of silk, woolen and cotton fabrics; after which operation the refuse, mixed with an equal proportion of pollard or middlings, is employed to feed poultry, for which purpose it is found to be both cheap and efficacious.

Solder, Nevada.—De Groot, Chief of the Mining Department of the Dutch East Indies, ascertained from actual survey that the tin of Banca, as is the case with the stream tin of Cornwall, has been derived from the disintegration of granitic rocks containing tin. In 1853 De Groot inspected all the stream works in the island, and found in the district of Paukalpinang three parallel veins running nearly east and west; one of them containing tin-ore in grains, like those found in the stream works. In 1855 W. Akeringa surveyed the Jeboes District, and found grains of tin-ore disseminated in granite; also that on every river that was streamed for tin, the largest grains were found nearest the hills, becoming smaller as the rivers approached the sea. As the rivers of Banca debouch into the sea in every direction from a central point, the above facts demonstrate that the Banca stream-tin is derived from the degradation of local rocks, and not the washing from continental mountains while the island was sunk under the ocean,—as was the opinion held for a long period; in fact, the Banca tin-streams form an exact parallel with those of Cornwall.

Napoleon the First.—The centennial anniversary of the birthday of Napoleon the First will be celebrated with appropriate honors and festivities on the 15th instant. Religious services will be held at the Church of Notre Dame, on Bush street, in the forenoon, after which the assemblage will proceed under military escort to the City Gardens, where a grand public festival will take place, to conclude with a ball and fireworks in the evening.

Eclipses.

Of all the phenomena of the heavens there are none which have more engaged the attention of mankind in all ages, than eclipses of the sun and moon. In the early periods of antiquity, and later, among unlearned nations, these events were regarded as alarming deviations from the established laws of nature, presaging public calamities or betoking divine displeasure. When the truth of astronomical knowledge was demonstrated by the power which the astronomer possessed of predicting eclipses, such phenomena were divested of their terror; and now eclipses are looked forward to by the multitude as matters of interest, and by the learned as events presenting rare opportunities for the more elaborate determination of various practical and scientific questions.

Among the subjects upon which eclipses are brought to bear, are:—The determination of errors in lunar tables, so important to navigators; to determine with greater precision the geography and figure of the earth; the parallaxes of the sun and moon, and other astronomical problems; the physical constitution of the moon, and of the sun itself, and of the space immediately surrounding it, etc.

Eclipses of the sun, as is well known, occur when the moon passes between that luminary and the earth; while eclipses of the moon occur when the earth passes between the sun and the moon. The former must always happen at the new moon, as on Saturday last, and the latter at the time of full moon, as is often observed. Eclipses of the sun always come from the west, and pass off towards the east. In eclipses of the moon this progress is always reversed.

The reason that eclipses of the sun are sometimes annular and at others total, is due to the fact that the earth and moon are sometimes nearer to the sun than at other times. When the earth is nearest to the sun, the apparent diameter of that luminary is so much increased that if the moon then comes directly between it and the observer a narrow ring of the sun is seen completely surrounding the moon. When the earth is at its farthest distance, the apparent diameter of the sun is so much diminished that the moon will completely cover it. The greatest possible duration of the annular appearance of any eclipse is twelve minutes and twenty-four seconds; the greatest possible duration of the totality of any eclipse is seven minutes and fifty-eight seconds. The moon, however, may continue totally eclipsed, or enveloped in the shadow of the earth, for the space of one hour and forty-five minutes. The earth is nearest to the sun in winter, and attains its greatest distance in summer. Hence, a total eclipse cannot occur in mid-winter, nor an annular in midsummer. A total eclipse, we believe, is impossible between the first of December and the first of February, and an annular between the first of June and the first of August.

In order to measure and record the path of eclipses, the apparent diameters of the sun or moon are divided into twelve parts, called digits, by imaginary lines drawn at equal distances across the apparent diameters. Eclipses can be calculated with the greatest precision, not only for years, but for centuries to come—and backwards as well as forwards.

The total eclipse of July 17th, 1860, was more accurately and thoroughly observed than any former one. It had been previously noticed in total eclipses of the sun that at the instant of totality, what appeared to be bright, rose-colored flames, shot out from behind the moon's disk, taking shapes very much like flames from the top of a burning building. Very little, however, could be learned of the true character of these phenomena until since the observations of the eclipse of 1860. It was not even satisfactorily proven till then whether they were connected with the sun or the moon. But, thanks to the spectroscope and photography, in the hands of skillful and scientific men, these questions, so important to a true understanding of the physical condition of the sun, have now been quite satisfactorily answered. It has been proven that they are tongues of flame, shut up from the surface of the photosphere, or luminous envelope of the sun—some of them to the height of many hundred thousands of miles, and 300 times larger than the earth. The spectroscope has also told us their nature, and the elements which are producing such wondrous combustion!

Further and still more important results are expected in this direction from the observations of the eclipse of Saturday last. Brief dispatches from several scientific parties have already announced that their observations have been most satisfactory. At Des Moines, Iowa, Prof. Harkness reports that they have secured 123 photographs of the eclipse, two of which were taken during the totality. Interesting results were also obtained from the spectrum observations. Most satisfactory results have also been received from Prof. Hayward, who was stationed at Bristol, Penn.

It will be recollected by many of our readers that on the 26th of March, 1859, a new planet, which has been named Vulcan, was discovered by a Frenchman named Lescarhault, moving in an orbit between Mercury and the sun; but which, we believe, has never been seen since. It has also been thought, for reasons well known to the scientific world, that there must be other small planets in the same zone of the solar system, but hidden from view by the brightness of the sun. Several astronomers had been especially entrusted with the duty of searching for those planets during the late eclipse. They were sought for both at Washington and Bristol; but were not seen from either of those localities. Probably other observers may have been more successful.

It will be months before the full results of the observations upon the eclipse of Saturday will be fully worked up and given to the public. When the work is done, however, there is every reason to believe that important results will be announced, especially with regard to the physical condition of the sun. Astronomers at the eclipse of 1860 got their feet on solid ground in that direction; and there is every probability that many great outstanding questions of much scientific interest will soon be settled; though in astronomy, as in all other departments of science, every new mountain top will only bring into view other loftier and still more distant summits.

Prof. J. D. Whitney, late of the California Geological Survey, is now in Colorado with a class of students from the Harvard Scientific School. The Professor expects to visit California previous to his return to the Atlantic States. It may not be generally known that during the year and a half or more since the Geological Survey has been stopped by cutting off its pecuniary support, both Prof. Whitney and Prof. Brewer have been more or less employed, at their own cost and expense, in completing such portions of the work of the survey as had been fully worked up in the field. Prof. Whitney has thus added to the list of the publications of the survey the second volume of the Paleontology of California, and two volumes descriptive of the Yosemite Valley—one entitled the "Guide Book" to the Yosemite, and the other the "Gift Book." The latter is one of the most beautiful and unique of American publications. Prof. Brewer, we believe, is still devoting what leisure time he can obtain from his duties at the Sheffield School in work on his report upon the botany of California.

Transportation in Bulk.

The Vallejo *Chronicle*, in noticing the fact that the grain elevator at that place has not yet been put into active use, says:

The proprietors of the elevator built the same only as a medium for receiving and handling grain, and it devolves upon other parties to send cargoes away. So far there has been no disposition on the part of grain owners to ship in bulk on their own account, and thus test the experiment. We learn that arrangements have been perfected recently to give this matter a fair test, and that three or four cargoes will be sent forward as soon as vessels can be engaged. A lot of wheat has been engaged from Santa Rosa, which will be forwarded through the elevator.

If it can be satisfactorily demonstrated that grain can be safely shipped from this port around Cape Horn, in bulk, a most important advantage will be gained for our great wheat-growing interest—one which will enable our farmers to realize from ten to twelve cents or more per cental over any price that can be paid for wheat which must be delivered on shipboard in sacks.

The handling and shipping of merchandise in bulk is one of the most important economical devices of the age, and is likely to soon find a very wide application. Oil has already, for a long time, been shipped in bulk, vessels being constructed with permanent iron tanks or bulkheads for that especial purpose. We last week mentioned the fact that the schooner Novelty had just arrived at Boston from the West Indies with a cargo of molasses in bulk. This first experiment of the kind was eminently successful, and effected a most important saving in the cost of transportation. It is thought that crude sugars may be handled in the same manner. Rice and various other grains, as well as wheat, may be handled by the elevator process; so may coffee. Liquid commodities of all kinds are peculiarly adaptable to this improved appliance of commerce. It is easy to conceive that an immense saving in the shifting and handling of cargoes of this description might be made by substituting the lift and force pump for the endless chain of the elevator.

But there is yet another, and one which, possibly, may yet prove the most important of all changes in the mode of transportation under consideration—that of coal. This suggestion, at first sight, will doubtless strike most readers with surprise; but a little reflection will show its extreme probability.

It is well known that only a very imperfect degree of combustion is attained in the ordinary mode of burning coal—in lamps and upon grates. It may not, perhaps, be so generally known that careful experiments, during the past two or three years, have shown quite conclusively that a far more effective and perfect degree of combustion may be obtained by first pulverizing it—grinding it to a fine powder and feeding it to the furnace, in that condition, by means of a blast. The cost of pulverizing it, as it comes from the mine, would be but a trifle in comparison with the advantage gained by the more thorough combustion attainable, when it is fed to the furnace in that condition. To this advantage may also be added a probable economy in handling by the application of the elevator to the new form which it would take as a pulverized fuel.

In fact it would be difficult to assign any limits to progress in this direction, so long as there is a single commodity still transported in packages under the old system, to which the plan of bulk shipment may be experimentally applied.

Mr. Seward is expected back in season to take part in the anniversary celebration of the admission of California into the Union, which takes place on the 9th of September. On his return he will be presented, by the Pioneers, with a thousand dollar cane.

Work at the Foundries.

Notwithstanding the general cry of dull times, there is still a noticeable amount of work going on at the various foundries throughout the city. The mines are by no means at a standstill, and so long as our quartz mills are pounding away upon the precious *ore*, just so long must the foundries keep them supplied with stamps, boilers, engines, and all the little etceteras which go to make up a complete mill. Our numerous manufacturing operations also furnish a large and rapidly increasing amount of work for the foundries and machine shops. We give below the substance of a few notes taken during a two-hours' ramble, the past week, along First and Fremont streets:

The Union.

There are now about 150 men employed at this foundry; and bustle and activity prevails in every department of these extensive works. Locomotive building appears to be quite a specialty here. They have just sent off a fine locomotive for the Virginia City and Truckee road; have another all ready to leave the shop, and a third, on which the workmen are just commencing. They are named respectively the Lyon, Ormsby, and Storey--counties of the State of Nevada. The two first have 14-inch cylinders with 22-inch stroke; the last will have 16-inch by 24. They are built with six driving-wheels forty inches in diameter, with single leading trucks or bogies--wheel base of engine 9½ feet. These machines have all been made in a most thorough and substantial manner, and are designed for their especial work, upon short curves and 116 foot grades.

This foundry is just shipping a large amount of quartz mill machinery for the Washington mine, Amador County, consisting of an engine 14 by 30, with Scott & Eckert's cut-off, a 60-inch tubular boiler, sixteen feet in length, with fifty-four 3¾-inch tubes. The mill consists of three batteries of five stamps each, with a Blake's crusher. A set of hoisting gear also accompanies the same.

They have also just shipped four boilers, with furnace fixtures complete, for the Consolidated Chloride Flat Company of White Pine—tubular boilers 54 in. diameter, 16 feet in length; also a 44-inch tubular boiler for Marysville.

They are building a mill which is to form an addition to the Hornitos Valley mill, and which will consist of twelve stamps, two Banx's Pans, four Hendy and one Hungerford concentrators, a Blake's crusher, shafting, etc.; also hydraulic pipe, etc., for a turbine wheel for the Los Gatos flouring mill, in Santa Clara County. The iron work for the Harrison street bridge in this city, consisting of truss rods, bolts, castings, washers, etc., are also being prepared at this foundry. The usual amount of general jobbing is being done.

The Ætna.

This, though one of the most recently established of our foundries, we are pleased to note gives evidence of prosperity and enterprise. At nearly every visit we make there, we observe an increased area of working room has been added since our previous call. This is one of the most lively establishments of the kind in the city. Among the different pieces of machinery, upon which the workmen were engaged, we noticed one which was a matter of considerable interest, as calling to mind some of the events of California's early history. The engine of the old Constitution, one of the first of the Panama line of steamers, has been unearthed from some old storehouse, where it has been lying amidst dust and rubbish for ten or twelve years, or ever since that steamer was sold. Under the transforming operations of skillful workmen it is being so made over and repaired, that it will soon come out nearly or quite as good as new, and will hereafter do duty on a tugboat at the mouth of the Columbia River. The boat is now being built by A. M. Simpson, at Oakland Point.

This foundry company is also building a set of sawmill machinery for a new mill, which is being put up near Astoria, on the Columbia River. They are also engaged upon the iron work for the extension of the Occidental Hotel, which is soon to occupy the present vacancy in the block on Montgomery between Bush and Sutter streets. This work consists of columns, pilasters, cornices, etc. The extension is to be of the same construction as that already in existence, and when completed, this elegant hotel will occupy the entire Montgomery street front of the above named block.

The iron work for the lighthouse recently ordered to be erected at Point Arenas, is being made at this foundry. The manufacture of Varney's pans has recently been transferred to this establishment. We noticed a large quantity of general work in progress, in every direction about the foundry.

An interesting feature has recently been introduced at this foundry, that of photographing all the machinery as fast as it is turned out. The conveniences and utility of such a system, must be apparent to every machinist; and is such as has secured its very general introduction into Eastern shops. The Ætna, we believe, was the first to introduce it as a regular thing, on this coast. The artist in charge of this department is a younger brother of the two Hanscom proprietors; and is also himself a regular employé in the establishment.

The Miners'.

This establishment, which has recently been closed out by its former proprietors, has now been started again on the coöperative plan. The coöperatives are some sixteen in number, and propose to manufacture all kinds of machinery, castings, etc., as heretofore. This move forms the only true solution to the antagonistic questions between labor and capital. In coöperative associations the laborers get whatever they earn, over and above a fair interest on the necessary investment; and as every man is interested in sharing the profits, so everyone is equally interested in putting in time to the best advantage, and turning out work in the best manner. When such establishments are brought to bear against capital, labor must find its level, and capital be shorn of its power to oppress labor. Strikes, and labor combinations to sustain them, are in every way demoralizing and hurtful, while coöperation is elevating and stimulating to industry. Mr. J. L. Moulthrop is Manager, and Mr. J. McLure Superintendent, of this new coöperative enterprise. We trust the association may prove a success. We shall refer again to our notes next week.

The Daily Fair Press.

The privilege of publishing a daily paper at the Mechanics' Pavilion during the coming Fair, has again been awarded to the proprietors of this paper, and we propose to give to the visiting public a still more readable and interesting paper than any which has preceded it. As an advertising medium, the *Fair Press* has always been popular, as it is distributed *gratis* to all who desire to "reach for it." Parties wishing to advertise should speak early.

THAT MEAT SHOWER.—The two acres of liver and "lights" is already reduced to 200 square feet. Upon this were visible several spatterings of blood and a few pieces of meat. A Los Angeles subscriber writes the *Alta* as follows: "Old Californians state that it is caused by the California vultures, which, having gorged themselves with dead horse and risen high in the air, eject it from their stomachs either from sickness or in battle with the eagle. They have frequently been seen to do this."

Mining Items in Brief.

NEW MINING REGION.—A prospecting party has recently returned, says the Colorado *Register* of June 15th, from a trip to the southwest, and near the southern fork of the Colorado river and the upper waters of the Arkansas. They report the discovery of a rich mineral region, and bring back samples of coarse gold. The locality is said to be 250 miles from any of the ordinary routes of travel. What it was thought might prove good diggings were found along an extent of fully 100 miles of territory. Gold-bearing quartz veins were found in great numbers, and one in particular of mammoth proportions, which was traced for several miles. Mr. Bond, the head of the party, thinks that the best mines in Colorado will be found in that region. The Indians are somewhat troublesome.

QUICKSILVER AT REESE RIVER.—Quicksilver is reported to have been found in the Eureka District, Reese River. It is found both native and in the form of cinnabar. Globules of pure quicksilver are seen standing in the crevices of the rocks, when they are exposed or near the surface.

GOLD DISCOVERIES are reported on Lewis river, four miles from Vancouver. Good reports are also received from the Umpqua river, in Douglass county, Oregon. Quartz has been found, producing specimens of very great richness.

A NEW GOLD BEACH is reported as having lately been discovered at Chehalis Point, Gray's Harbor, Washington Territory. Quite a number of persons are already engaged there with a number of sluices, at work upon the sands lying above the summer tides. The miners are somewhat reticent about what they are making; but it is thought they are doing well. The gold is reported as being round and heavy, therein differing from the light flaky gold of the beaches further south, on the Oregon and California Coast.

MINING DITCH IN OREGON.—A force of 700 Chinamen has arrived and been set to work on the Burnt River mining ditch in Eastern Oregon. It is said that this work will open up an extensive region to profitable mining enterprise.

ORE FROM THE COPE DISTRICT.—Six teams loaded with ore from the mines in the newly discovered Cope district, recently arrived at Elko on its way to this city, to be worked.

COPPER MINING IN FRESNO.—Twenty-five men are employed at the Buchanan Copper mine, in Fresno county, and taking out about eighteen tons of ore a day. The main shaft is 140 ft. deep, with a ten foot vein at the bottom. The company is in a flourishing condition, and a standing evidence that the copper interest is not entirely dead on this coast.

PLUMAS COUNTY contains twenty-six quartz mills.

NEW GAS MACHINE.—Mr. B. Sloper, of Chicago, who has recently patented a hydro-carbon gas machine, exhibited the same to a small party at the office of Fuller & Co., No. 109 Montgomery street, last evening. The apparatus, suitable for five or six burners, was contained in a cylinder nine inches in diameter and eighteen inches high upon a table. The light from a two-foot burner attached to the machine gave twice the amount of light of a six-foot burner supplied from the city gas works. The flames from the machine were nearly white, and sufficiently bright to enable the eye to readily discern colors. It is estimated that gas can be manufactured in this city for about $2.50 per 1,000 feet,—cheap enough to save the price of the machine in a short time. The apparatus will remain on exhibition at the same place for a few days, and we shall probably be able to speak more fully and definitely concerning it soon.

A MOUNTAIN IN LABOR.—Late accounts from Ball Mountain, near Romney, New Hampshire, report that protuberance, so well known to tourists, as giving signs of uneasiness. It has begun "to rumble." A live volcano in that region would prove a greater attraction than the sea serpent to Nahant.

THE SUEZ CANAL.—The formal inauguration of this great work will take place on the 17th of October next; but it will be ready for use by the first of the same month.

The Mining Interest—The Labor Question.

Mr. A. B. Paul, who has recently spent a week or two in Tuolumne County, informs us that the mining interest in that county, as a whole, is prosperous. Of the quartz interest in particular, he furnishes the following:

Hesley's mill of ten stamps has been running all the season. App's mill of ten stamps is being enlarged to twenty-five. Knas has just completed and set to work a new 10-stamp mill. The Golden Rule incorporated Company (has been a dividend paying company for a long time) has fifteen stamps. Pennsylvania Company of ten stamps is being increased to twenty. Rosencranz's mill, ten stamps, is running, and paying. Reed's, five stamps, Moony's, four stamps. McCurdy's four arastras are also active and paying, to say nothing of hundreds of lodes that can be made paying mines. The mining interest in Tuolumne may be taken as a fair index of the State generally.

Mr. Paul has also furnished the *Bulletin* of Thursday with some comments on the causes of the present general depression of business in the mining counties, where he shows that such depression is not due to any lack of prosperity in the mining interest; but to the general lack of capital to develop and population to fill up the county; and this lack of capital arises mainly from the high rate and unsettled condition of the labor question in this State. He thinks that before a reform can be effected, there must be a breaking up of old ideas—that the cost of traveling must come down, interest must come down, commissions must come down. Our ideas generally, of cost, must come down, *then* labor will come down. It will do no good to bring labor down and keep everything else up. "The war, as it now stands," says Mr. Paul, "is against labor—that must come down, they say. But why should labor come down and nothing else," asks Mr. P. Many of those who are continually crying out against the high price of labor, forgetful that nearly everything else is quite as high, would do well to stop and consider whether there may not be a beam in their own eyes. Let us all come down together, and the fall will be easy.

MECHANICS' INSTITUTE—RE-INCORPORATION.—A meeting of the Mechanics' Institute was held on Saturday evening last for the purpose of taking into consideration the propriety of the reincorporation of the Institute. The President, A. S. Hallidie, Esq., after calling the meeting to order, briefly stated the object for assembling, and read the legal opinion of M. M. Estee, advising the calling of a meeting for that purpose.

The Secretary then read the resolution of the Institute, calling the meeting, when Mr. Davis introduced the following resolution, which was adopted:

Resolved, That the Board of Directors of the Mechanics' Institute are hereby directed and authorized to at once reincorporate the Mechanics' Institute of the City of San Francisco, in accordance with the Act of the Legislature, entitled "An Act to Provide for the Formation of Chambers of Commerce, Boards of Trade, Mechanics' Institutes, and other kindred Protective Associations," approved March 31, 1866.

There being no other business, the meeting then adjourned.

STATE FAIR AGENT.—Mr. H. D. Dunn has been appointed agent for the Sacramento State Agricultural Fair, for this city and vicinity. Mr. Dunn's office is at 508 Battery street, where persons desirous to exhibit goods or machinery may find all the necessary information. The Fair commences on the 6th of September.

LONG TRIP FOR A LOCOMOTIVE.—Two locomotives for the C. P. R. R. arrived in Sacramento, on Monday of last week, by rail from the Schenectady (N. Y.) Locomotive works. Sixteen days were occupied in coming through.

Engineering.

The Tunnel under the English Channel.

We find the following in *Engineering* for July 9th:

That an address signed by so many powerful and influential names, has been presented to the Emperor of the French; that two of our leading engineers have advanced themselves as the advocates of the project; that in all probability the report of the French Commission will be supplemented by another from an English Committee; all these are facts which show that the work lacks neither patronage, nor energy, nor skill, to bring it to a successful issue, if nature has set up no insurmountable barrier. Mr. Hawkshaw was the first engineer to devote much time to the consideration of the project, and the only engineer who has gained as the result of a lengthened and costly survey, and a thorough exploration by means of borings, as certain a knowledge of the material through which the tunnel will have to be driveu, as it is possible to obtain. Mr. Hawkshaw's conclusions deduced from his observations are as follows :

1st. That there is a reasonable prospect that the work can be accomplished, but that it would be improper to deny that it is attended with a certain amount of risk.

2d. That this risk is limited to one contingency, viz: the possibility of sea-water finding its way by some unforeseen fissure into the workings in quantity too great to be overcome. Apart from this risk, tunneling in chalk is easy and rapid, and the execution of a tuunel of the length of the one under consideration is only a question of time and expense.

3d. There seems to be no reason to assume that the tuunel would cost more than ten millions sterling, or that it could not be completed in nine or ten ycars.

4th. The question of risk would be fully solved by sinking laud shafts on each coast, and driving the preliminary driftways. This portion of the work being safely accomplished, the remainder would be of an ordinary character.

5th. The possible loss would be measured by the cost of this preliminary work, which we estimate at one million and a half, and which could not exceed two millions, or say one-fifth of the whole cost of the tunnel.

6th. That this risk should be undertaken by the Government of France and England, if after consideration they deem the importance of the work and the probability of its completion sufficient to justify them in doing so.

Bridging the Connecticut.—The Board of Engineers, consisting of General C. B. Stuart, General George B. McClellan, and General Q. A. Gilmore, appointed to select a plan for a bridge across the Connecticut River at Middletown, for the "Air-line" Railroad between New York and Boston, and to designate the point at which it shall be built, recently met at the office of the chief engineer of the Air Line, Broadway, New York. The Board occupied the entire day in examining and discussing plans for the proposed bridge, and adjourned without taking final action, in order to visit the workshops where structures of the kind are made, and to examine some of the large iron draws now in use. The bridge is to be of wrought iron, and will be 1248, ft. long with a draw of two openings of 160 ft. each. The whole draw is to be 303 ft. long, and is to opeu and shut in one minute and thirty seconds. The track is to be about 42 ft. above ordinary water mark. The height of the truss is to be 20 ft. The bridge is to be capable of carrying 2 tons to the running foot, beside its own weight, and is to be capable of sustaining a train of locomotives passing over it at the rate of sixty miles an hour. The name of the new railroad of which this bridge is a part, is the New Haven, Middletown, and Willimantic Railroad, and will be opened within a year; the bridge is to be completed in eight or nine months. About forty different plans for the proposed bridge have been submitted to the Board of Engineers, and of these eight or nine have been found to be worthy of serious consideration.

A New Engineering Project.—A New York Journal says: "It is proposed to construct a ship canal from the lower part of our city across the meadows to the bay, thence across Bergen Neck, in almost a direct air line, to the channel of the Hudson River near Bedloe's Island. From the channel to the Bergen Neck shore, the canal will be 300 feet in width, with sixteen feet of water at low tide, or nearly twenty-two feet at high tide; being of sufficient depth to accommodate the largest vessels entering the harbor of New York. Piers will be built on each side of the canal, each 300 feet in width, to be filled in with solid filling of earth and stone. The outer sides of these piers will accommodate ordinary canal-boats and vessels of light draught, for loading or unloading, while the deep water of the canal will furnish wharfage for the largest ships and steamers."

A Test of Peat Fuel.—A trial to test the comparative calorific power of peat fuel was made in the engine room of the N. Y. *Tribune* establishment on July 11th. The two boilers were precisely alike, and in the trial used the same draft. Fires were started at 9 P. M. and the work continued steadily until 4 A. M. Under one boiler ordinary fuel—Lehigh anthracite, chestnut size—was burned, and under the other the fuel prepared by a peat company—each being carefully weighed. Seven hundred pounds of each were consumed, with the same resulting duty in both. This peat fuel is very compact, and in this instance was the non-resinous variety, yielding 10·8 per cent. of ash. The engineer expresses the opinion that, for making steam, it is equal, ton for ton, to the coal commonly used for that purpose.

Another Cable.—A third Atlantic cable is talked of. A New York company has been organized to carry out the project. The *Artisan* says: "The new line will be worked with what are known as 'sounder instruments,'—in other words, with those indicating the letters of the alphabet by sound, instead of the galvanometer system in use on the present submarine telegraphs. Two sets of these instruments have been made in Europe, one of them having been tested through three thousand miles of iron wire. It is thought that the plan of operations of the new company will be made public during the coming autumn."

Postmasters are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers or others will please inform us.

Pacific Mail Steamship Co's
STEAMSHIPS FOR
NEW YORK, JAPAN AND CHINA.
LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.
On the 10th, 17th and 30th of each month that has 30 days.
On the 10th, 18th and 30th of each month that has 31 days.
When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 17th falls on Sunday, they will leave on the Monday following.
Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.
Departure of the 17th or 18th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.
The following Steamships will be dispatched on dates as given below:
August 9th—SACRAMENTO.....Capt. W. H. Hudson, Connecting with ALASKA, Capt. Gray.
August 18th—GOLDEN CITY.....Capt. Wm. F. Laidlge, Connecting with HENRY CHAUNCEY, Capt. Connet.
August 30th—MONTANA.....Capt. E. S. Farnsworth, Connecting with ARIZONA, Capt. Maury.
Passengers berthed through. Baggage checked through. One hundred pounds allowed each adult.
An experienced Surgeon on board. Medicine and attendance free.
These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.
Through Tickets to Liverpool by the "Inman" and "National" Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.
For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.
No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.
The Steamship JAPAN, Captain J. H. Freeman, will be dispatched for YOKOHAMA and HONGKONG on SATURDAY, September 4th, 1869, at noon connecting at YOKOHAMA with the steamer NEW YORK for SHANGHAI. Shippers of freight to China or Japan are requested to mark on each package its destination.
For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

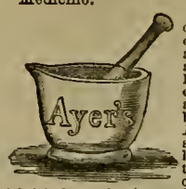
Ayer's Cathartic Pills,

For all the purposes of a Laxative Medicine.



Perhaps no one medicine is so universally required by everybody as a cathartic, nor was ever any before so universally adopted into use, in every country and among all classes, as this mild but efficient purgative *Pill*. The obvious reason is, that it is a more reliable and far more effectual remedy than any other. Those who have tried it, know that it cured them; those who have not, know that it cures their neighbors and friends, and all know that what it does once it does always — that it never fails through any fault or neglect of its composition. We have thousands upon thousands of certificates of their remarkable cures of the following complaints, but such cures are known in every neighborhood, and we need not publish them. Adapted to all ages and conditions in all climates; containing neither calomel or any deleterious drug, they may be taken with safety by anybody. Their sugar coating preserves them ever fresh and makes them pleasant to take, while being purely vegetable no harm can arise from their use in any quantity.

They operate by their powerful influence on the internal viscera to purify the blood and stimulate it into healthy action — remove the obstructions of the stomach, bowels, liver, and other organs of the body, restoring their irregular action to health, and by correcting, wherever they exist, such derangements as are the first origin of disease.

Minute directions are given in the wrapper on the box, for the following complaints, which these *Pills* rapidly cure; —

For **Dyspepsia** or **Indigestion, Listlessness, Languor** and **Loss of Appetite**, they should be taken moderately to stimulate the stomach and restore its healthy tone and action.

For **Liver Complaint** and its various symptoms, **Bilious Headache, Sick Headache, Jaundice** or **Green Sickness, Bilious Colic** and **Bilious Fevers**, they should be judiciously taken for each case, to correct the diseased action or remove the obstructions which cause it.

For **Dysentery** or **Diarrhœa**, but one mild dose is generally required.

For **Rheumatism, Gout, Gravel, Palpitation of the Heart, Pain in the Side, Back** and **Loins**, they should be continuously taken, as required, to change the diseased action of the system. With such change those complaints disappear.

For **Dropsy** and **Dropsical Swellings** they should be taken in large and frequent doses to produce the effect of a drastic purge.

For **Suppression** a large dose should be taken as it produces the desired effect by sympathy.

As a *Dinner Pill*, take one or two *Pills* to promote digestion and relieve the stomach.

An occasional dose stimulates the stomach and bowels into healthy action, restores the appetite, and invigorates the system. Hence it is often advantageous where no serious derangement exists. One who feels tolerably well, often finds that a dose of these *Pills* makes him feel decidedly better, from their cleansing and renovating effect on the digestive apparatus.

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the venous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the patient has at once can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever*; Dyspepsia in all its ages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever*; Gout, *when the patient is still able to walk*; Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

The Most Important Invention of the Day.

HALL & LEE'S

New Method of Packing Stationary Joints in Steam Engines,

— AND ALSO IN —

STEAM AND WATER PIPES.

BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam-tight inside as well as outside, thereby effectually preventing the steam from cutting into the joints of the steam chest. Consequently, an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam-tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869. By permission we refer to A. J Bluney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville. State, County and Mill Rights for sale by A. H. HALL & H. T. LEE, Marysville, Cal. 6v19-3m

Mining Property for Sale.

A Two Thirds Interest

OF THE

Golden Rule Mining Company's Claims and Mill,

Situated in Tuolumne County, California, two and a half miles south of Jamestown, on the Great Mother Quartz Lode. A good 15-stamp Water Power Quartz Mill is situated on the property, with a never-failing supply of water, as can be shown by the last four years continual running. This Claim has three parallel Ledges, from 50 to 100 feet apart, averaging from two to six feet in width, with a length of six hundred feet. They are so situated that a tunnel has been run through them at right angles, making a surface drainage of from seventy to eighty feet in depth on the mine. The mine is well ventilated by shafts from the surface, and well timbered so far as worked. In the mine are steam Hoisting Works, capable of hoisting from a depth of 300 feet. A force of thirteen men only are required to keep both mill and mine running regularly.

On the surface and flats for a distance of 500 feet from these veins, the ground or surface was mined by placer miners, in former years, producing from two to five ounces per day to the man, during the season when water could be obtained, which fact goes to prove that a heavy deposit of ore was once contained in the croppings of these slutes, which, by all former and present theories of deep mine workings, came from below, indicating that when sunk upon to a proper depth, the lead will develop a mine equal to the Amador or Eureka.

This claim has paid its 19th regular dividend of $1,500 each, during the past four years, besides all the construction and other expense account, and has levied no assessments during the same time, and at present has on hand $8,000 in the Treasury, and no debts.

The last level, 150 feet from the surface rock, averaged $7 per ton, on which was a profit of from $1 to $1 50 per ton. The length of the two shutes of ore on the east vein, and the only one worked upon, has been about 200 feet.

Now I propose to sell two thirds of this valuable property for $16,000, cash: and any party who desires to purchase a property of this kind—which theory has proven that it requires depth, on well known shutes of ore, for a sure fortune—can obtain a chance here, providing he or they will go down a sufficient depth. No purchaser is solicited unless he first goes and examine the mine, or sends a mining engineer in whom he can have confidence, to inform him what he may think proper of what has been here stated.

For any further particulars, direct by letter to Wm Bosworth, San Francisco, P. O. Box 1978, or at my office, room No. 5, over Donohoe & Kelly's Bank.

22v18tfqr WM BOSWORTH.

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL, are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address DEWEY & CO., Mining and Scientific Press office San Francisco.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

Copies of U. S. Patent Claims furnished immediately at small cost. Full copies of American or Foreign Patents can be obtained by telegraph or mail through this office at favorable rates.

For the Week Ending August 3d.

Printers' Galley Rest.—John M. Murphy, Olympia, Washington Territory.—93,216.

Flooring Clamp.—David Nevin, Boulder City, Colorado Territory.—93,217.

Lady's Chemise.—R. L. Jones, Sacramento, Cal.—93,390.

REISSUE.

Gymnastic Swing.—Alonzo P. Payson, San Francisco, Cal.—66,038. Dated June 25, 1867; reissue 3,582.

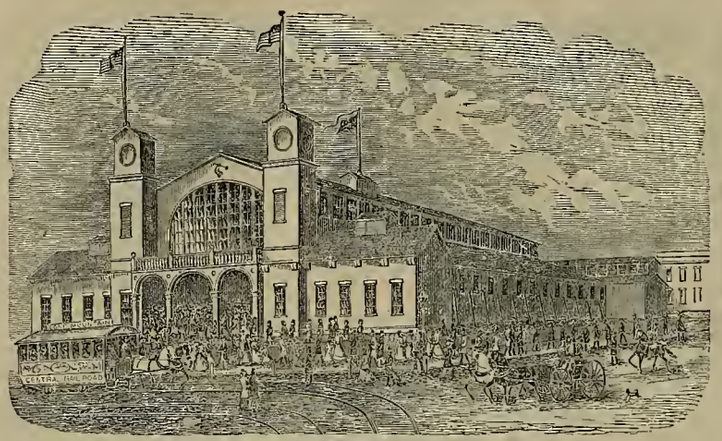
DESIGN.

Trade Mark.—Henry Ronndy, San Francisco, Cal., assignor to Califoruia Mariue Mctallic Paint Co., same place.—3,599.

Still Burning.—It is said that the fire on the Comstock ledge is still slowly burning. It is confined, however, to a portion of the mine which has been completely worked out, and is so walled in that it can neither spread, or at all interfere with any part of the working operations. The fire will probably continue until it ceases for lack of fuel.

The Mechanics' Fair Daily Press.

PRINTED AND CIRCULATED FREE IN THE PAVILION.



[COMMENCING SEPTEMBER 14TH, 1869.]

Over 100,000 Intelligent Individuals will read and preserve copies of the Fourth Volume of the Mechanics' Fair Daily Press.

Mountain Town Sites—Grass Valley. Commissioner-General Wilson has affirmed the decision of the Sacramento office that the donation of lands for town sites cannot extend beyond the limits of the corporation, and holds that the law positively prohibits the sale of mineral lands for town purposes. The Commissioner declares that before the application of Grass Valley can be decided, good and sufficient testimony will be required on the following points:

1st. As to the actual extent and area of the land covered by the town improvements which is within the incorporated limits of said town of Grass Valley.

2d. As to the mineral character of the land embraced within said corporate limits, and whether such lands are more valuable for purposes of trade and agriculture, or as mineral lands.

The Commissioner says the entry of Nevada town site was granted upon evidence that the mines had been mostly worked out and that the land was more valuable for trade and agriculture than for mining.

Chicago Visitors at Grass Valley.—Several members of the Chicago commercial party visited Grass Valley on the 7th inst., to take a look at the mines before leaving for home. "They received,"—says the *Union*,—"a cordial greeting from a number of our townsmen, and in the afternoon accepted an invitation from Capt. Lee to visit the fine works of the Empire mine. Several carriages, containing the party and several citizens of Grass Valley, visited first the Empire mine and afterward the Eureka mine, where they were hospitably received by Mr. William Watt. They were much interested in the details of quartz mining, and were undoubtedly impressed with the richness of the gold fields of California, and particularly of this, the most famous quartz mining locality of the State."

Patent Office Reports, from 1843 to 1847, Mechanical, are wanted for duplicate copies at this office. Parties having them for sale will please state price and address DEWEY & CO., Mining and Scientific Press office San Francisco.

Returned.—Dr. J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. Howland.

Co-Operative Union Store.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco 24v18-4w

Dr. Hall has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Dewilz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18-3m

Asiatic Cholera.—The Strongest Proof of Intrinsic Merit.—Dear Sir: I ought to have acknowledged long ago the box of Pain Killer you had the goodness to send me. Its coming was most providential. I believe hundred of lives were saved, under God, by it. The Cholera appeared here soon after we received it. We resorted at once to the Pain Killer, using as directed for Cholera. A list was kept of all to whom the Pain Killer was given, and our native assistants assured us that eight out of every ten to whom it was prescribed recovered. It has proved an incalculable blessing to multitudes of poor people throughout all this region. Our native preachers are never willing to go out on their excursions without a supply of the Pain Killer. It gives them favor in the eyes of the people, and access to families by whom otherwise they would be very indifferently received. Believe me, gratefully and faithfully yours, J. M. JOHNSON, Missionary, Swatow, China.

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

Information for Inventors and Patentees.

AN EXTRACT

From the American and Foreign Patent Agency Circular of the Mining and Scientific Press, Dewey & Co., Publishers.

Hints to Inventors.

The assignee of every invention may have the patent issue to him directly, when he is the purchaser of the entire interest.

A patent may issue in the joint names of the inventor and assignee, the inventor himself being one of the assignees.

The application must be made by the actual inventor, if alive; but if the inventor be dead, it may be made by his heirs or executors.

A working model is always desirable to enable the office to determine its precise operation. The name of the inventor and also of the assignee, if assigned, must be fixed upon it in a permanent manner.

What is really embraced in the original invention, and so described or shown that it might have been embraced in the original patent, may be the subject of a reissue.

The mere fact of prior invention abroad will not prevent the granting of a patent, unless the invention had been described in some printed publication.

When the patent is applied for in the United States, after being obtained abroad, it will extend only fourteen years from the date of the foreign patent.

Every assignment should be recorded in the Patent Office within three months from its date.

If old materials and old principles are used in a state of combination to produce a new result, the inventor may obtain a valid patent for such result.

When an application has been rejected, the inventor may manufacture his invention for two years, with the privilege of renewing his application within that time, if he so desires.

The inventor or inventors must sign the petition and claims, the latter to be attested by two witnesses, also take the required oath before some authorized person.

A partner, who is not an inventor, cannot sign a joint application without committing perjury.

If the inventor fails to pay his last Government Fee within the time prescribed after the patent is allowed (six months), he may, at any time within two years, renew his application by paying the first fee again, and thus finally obtain his patent.

Models may be withdrawn from the Patent Office by inventors when their cases are rejected.

The actual manufacture, sale, or use of an *article* may infringe—but the sale or purchase of *patent rights* is not infringement.

A patent right is personal property, and is assignable, but cannot be seized and sold on execution.

Small agents swarm about the Patent Office block at Washington, ready to receive the unwary applicant, who determines to go to Washington to prosecute his own claims. Ingeniously-worded and cunningly devised circulars, are showered upon every patentee when his claims are first published, and inventors are led to believe that in future their patents can be secured at very low rates. We have never heard of an inventor, here or in Washington, employing any of these promising letter-senders at anything less than exorbitant prices in the end, for services performed. A majority of the substantial offices in Washington are branch agencies of houses in other cities.

The published rules of the Patent Office say: "The Patent Office cannot respond to inquiries as to the novelty of an alleged invention, in advance of an application for a patent, nor to inquiries founded upon brief and imperfect descriptions propounded with a view of ascertaining whether such alleged improvements have been patented, and if so, to whom; nor can it act as an expounder of the patent law, nor as counselor for individuals." Such information should be sought through intelligent and reliable agents.

Selling Patent Rights.

While we are willing to give our best advice and assistance to worthy inventors, we cannot flatter them with promises to sell their patents. It requires quite a different order of education and talents to obtain patents, from that necessary to make a successful vendor. Those who are adepts at the latter are not apt to be proficient in the former.

Our advice to patentees is to make the value of your inventions known as widely as possible at once, and do your own selling, with such assistance as you can secure among your own acquaintances, and such parties as are thoroughly recommended. Inventors who have a good thing are apt to underrate their own ability in this line until they try.

More valuable patent rights have been sold on the Pacific Coast by reason of the information given of them by illustrations in the MINING AND SCIENTIFIC PRESS, than through any other source. The cost of such illustrations is little in comparison with the satisfaction gained.

☞Our Illustrated Pamphlet, from which the above is an extract, will be furnished free on receipt of postage stamp. Confidential advice given, and every legitimate branch of Patent Soliciting business promptly and faithfully executed, by

DEWEY & CO.,

Publishers Mining and Scientific Press, 414 Clay street, San Francisco.

QUARTZ OPERATOR'S HAND-BOOK.

—BY—

WHEELER & RANDALL.

San Francisco, 1865.

A cheap and handy book for Quartz Prospectors, Millmen, and Amateur Assayers.

This little work, of 130 pages although partly devoted to a discussion of limited interest to general readers, contains instructions in the WORKING AND ASSAYING OF ORES, AND TABLES FOR REFERENCE, which renders it quite desirable and of frequent service.

Price, $1, coin—$1 30 in currency or postage stamps. For sale by DEWEY & CO.,

1am Mining and Scientific Press, San Francisco.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,

Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs A S Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

Office, No. 11 Hayward's Building, 419 California street, San Francisco. jy31

Kincaid Flat Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of August, 1869, an assessment of two dollars and fifty cents ($2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 220 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighth day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twenty-fifth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary.

Office, 220 Clay street, San Francisco, Cal. au7

Lyon Mill and Mining Company, Kelsey District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty first day of July, 1869, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

THOS. J. OWENS, Secretary.

Office, Room 37 New Merchants' Exchange, California street, San Francisco. jy24

Marlborough Silver Mining Company.—Location of Works: White Pine District, (formerly Lander County), State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of July, 1869, an assessment of five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 502 Montgomery street, Room No. 3, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1869, shall be deemed delinquent and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirteenth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

AUG. DUPRAT, Secretary.

Office, No. 502 Montgomery street, Room No. 3, San Francisco, Cal. jy24

Office Senator Silver Mining Company.—Location of Mine: Storey County, State of Nevada.

NOTICE.—The Annual Meeting of the stockholders of the Senator Silver Mining Company will be held on WEDNESDAY, the twenty-fifth day of August, 1869, at one o'clock P. M., at the office of the Company, No. 408 California street, for the purpose of electing a Board of Trustees to serve for the ensuing year, and for the transaction of such other business as may properly come before the meeting.

T. B. WINGARD, Secretary.

San Francisco, August 6th, 1869. au7

Silver Sprout Mining Company.—Location of Works and Mines: Kearsarge District, Inyo county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-seventh day of July, 1869, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 408 California street.

Any stock upon which said assessment shall remain unpaid on the thirty-first day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twentieth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.

Office, 408 California street, San Francisco. jy31

Yosemite Mining Company, Humboldt County, Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the second (2d) day of July, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
W N Wade	148	315	$157 50

And in accordance with law, and an order of the Board of Trustees, made on the second (2d) day of July, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. S. L. Jones & Co., auctioneers, 207 and 209 California street, on Tuesday, the twenty fourth day of August, 1869, at the hour of 1½ o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

D. H. CROWE, Secretary *pro tem.*

Office, No. 220 Clay street, San Francisco. au6

Something to Happen in 1870.

"On September 1, 1859, shortly before noon, two astronomers—Messrs. Hodgson and Carrington—one at Oxford, the other in London, were at the same instant scrutinizing a large group of sun spots. On a sudden two intensely bright patches of light appeared in front of the cluster. Within five minutes the spots travelled over a space of nearly 34,000 miles. Now, at the Kew Observatory there are self-registering magnetic instruments which indicate changes of terrestrial magnetism. At one time the line traced by the pointer will be marked by scarcely perceptible undulations, indicating the almost quiescent state of the great terrestrial magnet. At another, well-marked waves along the line exhibit the pulsations of the magnetic system, influenced in a manner as yet unintelligible to the physicist. And there is a third form of disturbance, the sharp, sudden jerks of the pointer, exhibiting the occurrence of those mysterious phenomena termed "magnetic storms." When the records of the Kew Observatory came to be looked over, it was found that at the very instant in which the brilliant spots of light had appeared to Messrs. Hodgson and Carrington, the self-registering instruments had been subjected to the third form of disturbance.—a magnetic storm began, in fact, as the light broke out on the sun's surface. But this was not the only evidence of the sympatby with which the earth responded to the solar action. It was subsequently found that soon after the spots of light bad appeared, the whole frame of the earth had thrilled under a mysterious magnetic influence. At the West Indies, in South America, in Australia, wherever magnetic observations are systematically made, the observers had the same story to tell. In the telegraph stations at Washington and Philadelphia, the signal-men received strong electric shocks. In Norway, telegrapbic machinery was set on fire. The pen of Bain's telegraph was followed by a flame. And wherever telegraph wires were in action, well marked indications of disturbance presented themselves. Hours passed before the earth resumed its ordinary state. During the night, magnificent auroras spread their waving streamers over the sky, both in the northern and the southern hemisphere. As the disturbed needle vibrated, the colored streamers waved responsive, and it was only when the magnetic storm was subsiding that the auroral lights faded."

The Loudon *Spectator*, from an article in which the above was clipped, proceeds to indulge in the following speculations: "Now, it is evident that the phenomena show the most intimate relation between the peculiar disturbances in the sun and the magnetic currents of our own earth. Directly one of these changes take place upwards of ninety millions of miles away, the electric condition of our planet is changed in some mysterious way, of which our instruments, and even the condition of our sky, bear record. Moreover, these changes in the condition of the sun take place at intervals of about 11 years. If so, perhaps the magnetic excitement of 1859 will recur, and it may be in much greater force next year—in 1870. And if it does, how are we to say what may or may not recur with it? It is quite possible that those periods of speculative financial excitement—which are also said to follow a periodic law of something like the same period—may be more or less dependent on the magnetic condition of our planet; that so mean a phenomenon as speculative frenzy on the various stock exchanges of Europe may be more or less connected with these wonderful discharges of voltaic batteries in the sun, Is it quite impossible that the electric political condition of Europe in 1848—and again, at an interval of eleven years, in the year of Italian revival and revolution, 1859—may not recur after one more period of eleven years, in 1870, in consequence of the returning epoch of magnetic excitement in the sun?"

Machinists and Foundries.

PALMER, KNOX & CO.,
Golden State Iron Works,
Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.
MANUFACTURE ALL KINDS OF
MACHINERY,
STEAM ENGINES AND QUARTZ MILLS
NUNBAR'S IMPROVED
Self-Adjusting Piston Packing,
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.
WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S
AMALGAMATOR AND SEPARATOR,
Knox's Amalgamators,
WITH PALMER'S PATENT STEAM CHEST,
superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.
Genuine White Iron Stamp Shoes and Dies
Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.
Pacific Iron Works.
First and Fremont Streets,
SAN FRANCISCO.
Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.
Among other things, we manufacture the following:
STEAM ENGINES,
Horizontal and Vertical, for either Stationary or Marine use.
BOILERS—High and Low Pressure,
Pump, Pipe and Sheet Iron Work of every kind.
Quartz Mill Work,
including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.
Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.
Castings of every description, Iron and Brass.
We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.
Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.
GODDARD & CO.
San Francisco, May 1, 1863. 18v16tf

CALIFORNIA BRASS FOUNDRY.
No. 125 First street, opposite Minna,
SAN FRANCISCO.
ALL KINDS of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch.
☞ PRICES MODERATE. ☜

FOUNDRY FACINGS.
BENJAMIN ELLIOT,
No. 483 Brannan street.....San Francisco,
Manufactures Foundry Facings constantly, from choice coals. Bituminous, packed in tight sacks. Anthracite and Charcoal ground together or separate, packed in whole or half barrels Black Lead, Coke and Soapstone ground to order. Foundrymen located far from choice material, can rely on having superior Facings forwarded to order.
10v18qr

JAMES MACKEN,
COPPERSMITH,
226 Fremont st., bet. Howard & Folsom.
All kinds of COPPER WORK done to order in the best manner. Particular attention paid to Steamboat, Sugar House and Distillery work.
Repairing promptly and neatly attended to.
13v11

THOMPSON BROTHERS,
EUREKA FOUNDRY,
129 and 131 Beale street, between Mission and Howard, San Francisco.
LIGHT AND HEAVY CASTINGS,
of every description, manufactured 24v16qr

CITY IRON WORKS COMPANY.
CLERC & CO.,
IRON FOUNDERS,
Steam Engine Builders, and Makers of all kinds of Machinery,
6v16qr No. 28 Fremont street, San Francisco.

McAFEE, SPIERS & CO.,
BOILER MAKERS
AND GENERAL MACHINISTS,
Howard st, between Fremont and Beale, San Francisco.
Flue or Tubular Boilers, with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.
Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, height of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.
Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.
To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.
Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care
To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas, but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 1v16tf

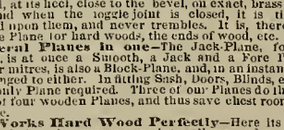
6v19-3m

To all who use Planes.
The superiority of Iron Planes over those made of wood, for durability and accuracy, is no longer a question and the objections of high price, extra weight, and "sticking" to the wood, of those formerly introduced, are now overcome by the PALMER'S PATENT.


Some of its Peculiarities—The Throat is adjustable, and can, in an instant, be made very fine, or very coarse. The Bit is set for the work to be done, by simply moving a lever. The Bit is squared with the face of the plane, by another lever. Both of these movements are instantly and easily made by the fingers, without loosening the bit. The Bit is fastened by a toggle joint, and can be put in and taken out "as quick as wink." The Bit is firmly bedded, at its heel, close to the bevel, on exact, brass bearing, and when the toggle joint is closed, it is tightly pressed upon them, and never trembles. It is, therefore, just the Plane for hard woods, the ends of wood, etc.
Several Planes in one—The Jack-Plane, for instance, is at once a Smooth, a Jack and a Fore Plane, and for mitres, is also a Block-Plane, and, in an instant, can be changed to either. In fitting Sash, Doors, Blinds, etc., it is the only Plane required. Three of our Planes do the full work of four wooden Planes, and thus save chest room and luggage.
It Works Hard Wood Perfectly—Here its accuracy and nice adjustments come into full use, and no other Plane can compare with it.
Agents Wanted to take orders for these Planes. Call and examine them and learn full particulars, at the CALIFORNIA WIRE WORKS of
6v19tf H. T. GRAVES, No. 412 Clay street.

By Mail.—The *Mining and Scientific Press* will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of the old and new location, and the paper will be sent accordingly

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

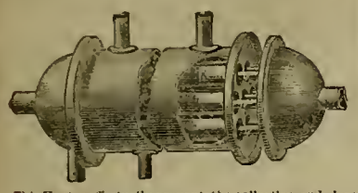
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, **220** Fremont street,

1v1 San Francisco.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion, of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

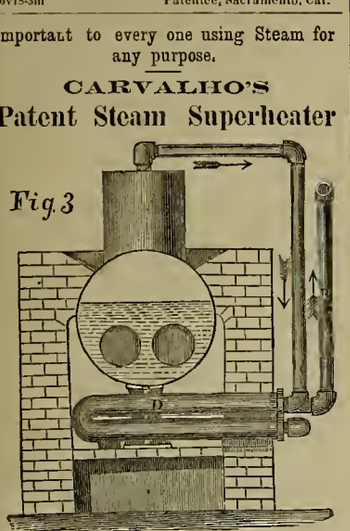
WM. B. CROSS,

16v18-3m Patentee, Sacramento, Cal.

Important to every one using Steam for any purpose.

CARVALHO'S
Patent Steam Superheater

Fig. 3



[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1869.

"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after *seven* years of service.)

"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.

"Superheater saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.

"Superheater saves 20 per cent. of coal, less steam pressure, exhaust more serviceable in drying paper."

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.

"Superheater saves not less than 20 per cent. fuel; no priming!"

CROCKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.

"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y. DYEING & PRINTING ESTAB., Oct 4, 1867.

"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINUOUS OIL REFINING CO., Binghampton, N. Y., Sept. 20, 1867.

"Superheaters give entire satisfaction, and we superheat to 55° deg—an increase of 20° deg."

CAREW MANUF. CO., So. Hadley Falls, Mass., Oct. 17, '67.

"Superheater saves 15 or 20 per cent fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867.

"Superheater saves at least 25 per cent in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867.

"Superheater saves 25 to 30 per cent. in fuel; no priming."

CONTRA COSTA LAUNDRY, Oakland, July, 1868

"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAVILAH M. CO., Cal., August, 1868

"Superheater causes a use of 40 lbs. steam instead of 60 lbs.; use much less water, and there is a saving of fuel." (2 sets.)

SIXTH MECHANICS' INST FAIR, S. F. Sept. 4, 1868.

"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.

"Superheater is a perfect success, and saves three cords of wood in ten, or 33⅓ per cent. in fuel; engine works better."

And many other letters of the same tenor.

Awarded Silver Medal, Mechanics' Institute, San Francisco, 1868.

Awarded Silver Medal, Maryland Institute, Baltimore.

Awarded Silver Medal, American Institute, New York, 1865.

Send for Circular to ÆTNA IRON WORKS, San Francisco, California. ROBT. L. HARRIS, Agent.

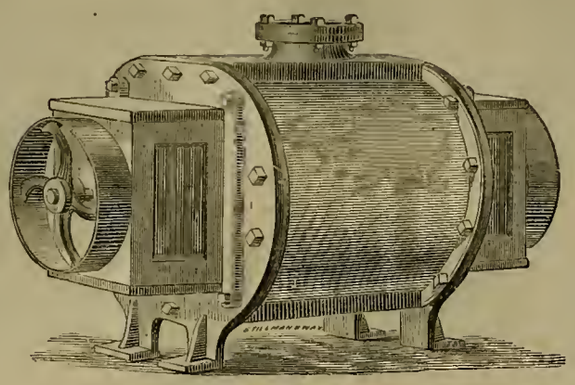
JOHN L. CONSTABLE, Engineer. 25v18tf

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

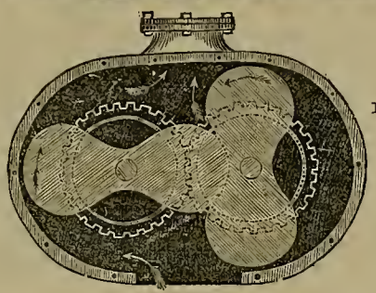
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 31, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

REBELLIOUS ORES.

THE HAGAN FURNACE.

The above method for the purification of Rebellious Ores is respectfully offered to the public. Repeated actual workings show that the

HAGAN FURNACE

Will accomplish all that the Reverberatory Process will do, and at an expense that is merely nominal. It has never failed to treat any ore effectually.

It has never been claimed for it that it will extract gold from ores which do not contain any of that metal.

Parties owning rich but refractory veins, can treat with the undersigned upon the basis of

GUARANTEED RESULTS.

With responsible security. For an interview, and all desired particulars, address

THE PACIFIC ORE CO.,

P. O. Box **1019**, San Francisco.

June 25 1869. 29v18-3m

RANSOME'S PATENT
Diamond Grit Grindstones,

Warranted of Uniform Texture,

TWICE AS STRONG AND WILL CUT AT LEAST TEN TIMES AS FAST AS THE BEST NATURAL STONES.

We manufacture the following qualities, viz:

"Hard," for Machinists, etc.

"Medium," for General Use.

"Soft," for Wood Workers, Etc.,

Diameters, **4** to **70** inches; thickness, ¼ inch to 12 inches; and any fineness required.

Solid Emery Wheels and Sharpening Stones,

Of all forms and materials.

These Stones are fast superseding the natural ones in England, the tests made there showing them to cut about fifty (50) times as fast as the Newcastle, and entirely free flaws, and hard and soft spots.

☞Grindstones, with Frames, Iron Troughs, Shafts and Treadles, ready to set up in working order, for sale a wholesale or retail.

PACIFIC STONE COMPANY,

E. T. STEEN, Sup't.,

20v18tf Cor. Turk and Larkin sts. San Francisco.

Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,

8v13-1y Stove Store, No. 1 Clay street, below Davis.

International Hotel,

JACKSON STREET,

BETWEEN MONTGOMERY AND KEARNY STS.,

SAN FRANCISCO, CAL.

THIS OLD ESTABLISHED HOUSE IS IN PERFECT order for the accommodation of guests. Persons seeking comfort and economy will find this the best Hotel in the city to stop at. The Beds are new and in good order, and the Rooms well ventilated. The Table will always be supplied with the best in the market.

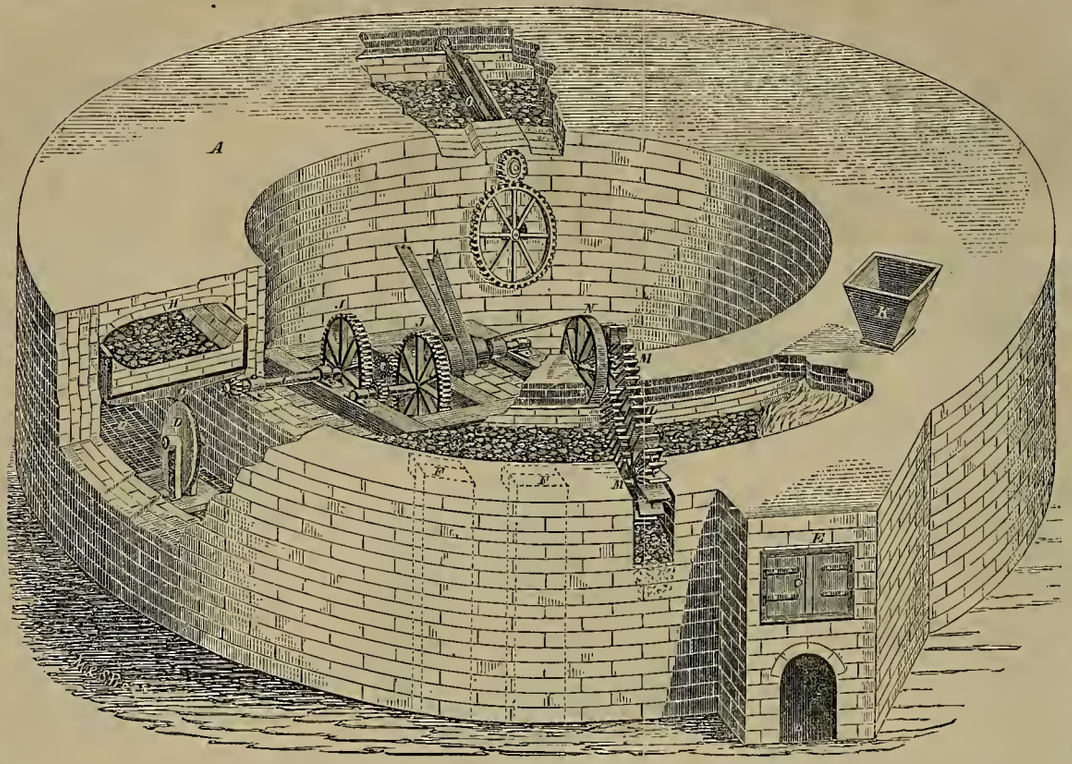
Prices varying from $1 50 to $2 per day for Board and Room.

FINE BATH HOUSE AND BARBER SHOP ATTACHED TO THE HOUSE.

☞ Teams belonging to the House will be in attendance at all the boats and cars to convey passengers to the House FREE OF CHARGE, and to any part of the city for **50** cents

21v12 F. E. WEYGANT, Proprietor.

Fred. Ernst's Patent Rotary Roasting Furnace.



This is a mechanical furnace, which does away entirely with manual labor, excepting a fireman. It charges, roasts, stirs, and discharges the ore by a very simple mechanical contrivance,—in fact performs all the operation required in the oxidation or chlorination process of roasting gold or silver ores.

The ore is taken by means of an elevator from the battery, and is discharged constantly and regularly into the hopper, *K*, from whence it reaches the rotating hearth, *G*. This hearth consists of a cast iron orbicular ring paved or lined with bricks, and revolves on a series of iron rollers, *D*, and is kept continually in motion by means of the gearing, *J*. This gearing has two gear wheels, three feet in diameter, and pinions to regulate the speed from the cone pulley, increasing or diminishing it to conform to the required slow motion of the hearth, *G*. The hearth so charged and running constantly carries the ore into the first heat, which is next to the flues, and so passes all the different temperatures of the furnace, thus effecting a very uniform heating and chemical action on the ore; at the same time it has also to pass the stirrers, of which there are different kinds,—stationary and movable ones,—the number and speed of the latter varying according as the ore contains more or less sulphur. The movable paddle stirrers are shown at *O*. These movable stirrers are connected with the gearing under the iron bed of the hearth, *G*, as shown at different points, until it passes the fire-bridge, where it receives its ultimate and highest heat, and is then discharged by the discharging apparatus. This discharging apparatus consists of two chain or rag wheels, *M, M*. These two chain-wheels drive a double endless chain with inserted plates of iron (scrapers). The chain hanging loose underneath between the wheels draws these iron plates through the cavity of the hearth, and so discharges constantly the roasted ore. The construction of this furnace is of the simplest kind, and all the necessary castings can be easily transported even on mule-back. The loss of the silver by sublimation in present furnaces, it is claimed, is avoided in this, as the silver condenses before reaching the flues; the distance being great, and the heat diminishing gradually until the gases reach the point of final exit. Liberal terms are offered to parties who desire to use this furnace. Further information can be had by addressing the Inventor and Patentee,

To keep the current of air constant throughout the whole length of the furnace, the arch over the hearth decreases slightly from the fire-bridge toward the flues. For concentrated sulphurets it may be advantageous to increase the circumference of the hearth. The advantages claimed as attainable from the use of this machine are—the doing away with a large portion of the costly hand labor ordinarily required, and the better and more thorough accomplishment of the same by machinery. A great saving of fuel, not only through the length of the hearth, but also for the reason that all the gases which are lost by other furnaces are economically employed in this as a substitute for other fuel.

The furnace is so constructed that the large access of air required for the oxidation of the ore, in addition to that demanded for the consumption of these gases, does not operate to materially lower the temperature in the furnace. When the ore in this furnace is once desulphurized, the gases cannot form any new combination with the ores or metals therein, for the reason that while the currents of air and gases are moving to the rear, the furnace hearth is constantly advancing in an opposite direction.

F. ERNST, San Antonio, Lower California, Mexico,

Or by calling upon H. W. SCHMIDT, Druggist, Kearny street, corner of Sacramento, or at this office.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-ly 16p

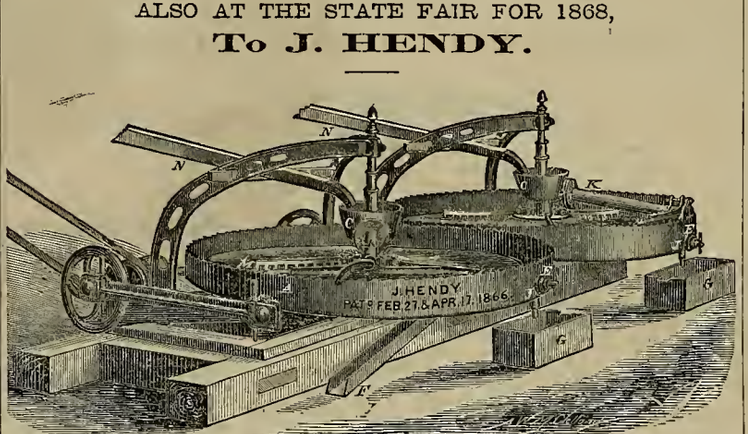
PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.



A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

Mr. Hendy, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

Office of North Star Mine, Grass Valley, Nov. 12, 1868.

Joshua Hendy, Esq.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.
Office at Union Iron Works.

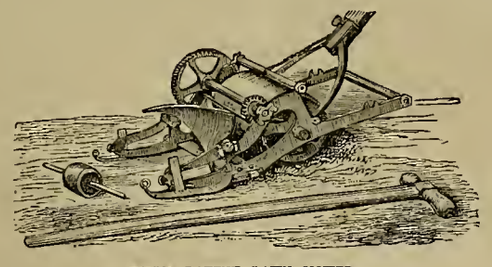
Hill's Patent Lawn Mower.

Close-shaven lawns add greatly to the beauty of grounds about a residence; while a rugged, rough mown or uneven growth of years is an eye-sore to good taste anywhere. The English have set the world a most excellent example of this mode of ornamentation; but the cost of keeping such grounds in order has ever been a great drawback to their general introduction and maintenance in America. To make a fine velvety lawn, the grass should be cut once, certainly, better, twice a week. Ordinary scythes make the work too rough; while shears, as ordinarily employed, are quite too slow. Yankee ingenuity, however, has recently met the want, and given us a light and most excellent machine for doing this work well and quickly.



HILL'S PATENT LAWN MOWER.

We give herewith an illustration of one of these devices, the operation of which will be readily seen by any one accustomed to the use of such instruments. It is so small and light that it is easily pushed forward by a handle, with a cross-head. The forward motion communicates a rapid revolution to spiral cutters, which cut the grass very evenly, and leaves it smooth and close shorn. The caster-roller is to be used when mowing borders, and when not in use it can be carried on the rear end of the machine. The height of cut is regulated by adjusting the shoes, and the handle is adjustable to different heights by the chain hook. All the parts of the machine are made to interchange, so that in case of breakage any single part can be supplied. The machine cuts fourteen inches wide, and weighs seventy-five pounds.

This machine has been very extensively introduced in the Eastern States, where it is considered a great acquisition to every well regulated homestead. Quite a number of the machines have been sold on this coast. Among those who are using, and who highly recommend it, we may mention Messrs. Stanyan, Benchley, J. A. Donahoe, Sather, Baker, Horgan, Supt. of City Parks, and many others of this city, as well as quite a number of residents across the Bay in Oakland, at Alameda, etc. Dr. Barlow J. Smith, at 637 California street, is sole agent for the sale of this machine on the Pacific coast, from whom any farther particulars may be learned.

RETURN OF ROSS BROWNE.—Our Minister to China, J. Ross Browne, returned in the steamer which arrived on Wednesday. When Mr. Browne left Pekin, he expected to meet his successor at Shanghai. On learning there the actual state of affairs, he has no doubt done wisely in returning to this city, leaving his legation in proper hands, to learn what may be the intent and wishes of the government. Mr. Browne is not a man to occupy a post where he thinks he is not wanted. In whatever regard government may hold his services, we think there is but one opinion on the Pacific Coast,—the portion of the Union most interested,—as to the manner in which he has discharged the responsible mission which has been intrusted to his hands. There is no question, we think, but that the interest of the public would be served, by his immediate return, with the fullest expression of confidence in his acts, on the part of the government. What plans the politicians may have in view, we know not; we only hope they may be induced to listen to the voice of the people most interested in this important mission.

THE completion of the Pacific Railroad has advanced California and her sister States on the Pacific slope, from the condition of distant and dependent provinces, to a full standing in the Union, with all the privileges and benefits resulting therefrom.

THE POLYTECHNIC ASSOCIATION. —The next lecture before the Polytechnic Association of the Mechanics' Institute, will be given by Prof. LeConte, of the University of California, on Thursday evening, September 2d.

The Late Eclipse of the Sun.

We have elsewhere given, in the present number, a brief description of the late eclipse of the sun as it appeared to the observers stationed at Des Moines. We give herewith a diagram, as it always appears, (of course, with varying lines of light) of the corona at the moment of total obscuration, the small protuberances issuing from the right side of the moon's disk, are intended to represent the "points of rose-colored light" or "tongues of flame," which present such a remarkable appearance at the instant of totality, and which also appear with varying forms. These colored flames have already led to most important results in the determination of the physical constitution of the sun; and their study will still farther employ a large share of attention in the investigations to be undertaken from the phenomena of the late eclipse.

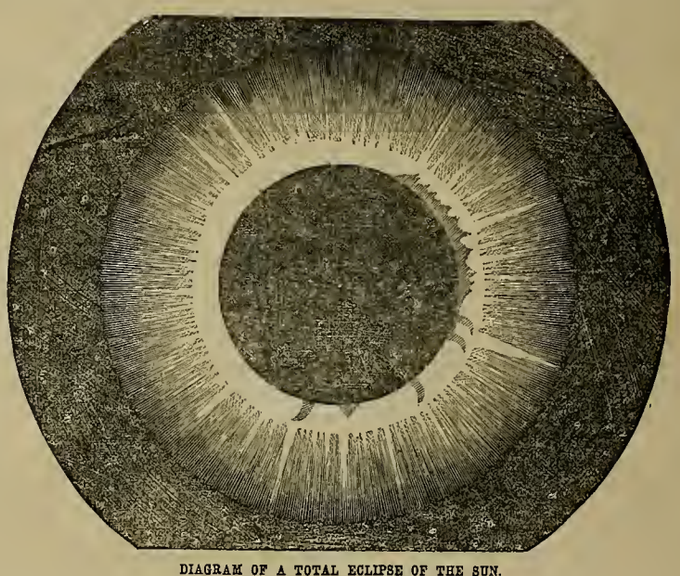


DIAGRAM OF A TOTAL ECLIPSE OF THE SUN.

They make their appearance, as already observed, as soon as the disk of the sun has been completely covered, and as the moon's disk moves forward they gradually disappear from the side where first seen, and others appear upon the opposite side, and continue to increase in size and height until their base is seen to rest upon the appearing disk of the sun, when they are immediately lost in the intensity of the light of that luminary.

Their successive appearance and disappearance in the manner described proves their immediate connection with the sun; while the observations made upon them by the spectroscope, the instrument described in another column, shows that they are really what they appear to be—great tongues or mountains of flame, rising to immense heights from the sun's surface—some of them reaching an elevation of not less than 70,000 miles, or one-twelfth of the sun's diameter. This and other revelations of science settles beyond a doubt the fact that the sun is an incandescent mass of material, similar to those which constitute the earth, and that it is surrounded by an atmosphere, in which active combustion is constantly going on.

Such of our readers as are familiar with the observations of the eclipse of 1868, will appreciate the interest which is felt among scientists, to add, from the late opportunity, important discoveries to those which have already been made. Whatever valuable results may be arrived at, from time to time, as the late observations may be worked out, we shall place before our readers as fast as they come to hand.

NOT COMING.—We regret to state that the sudden death of an only brother, will prevent Prof. Brush, of the Sheffield Scientific School, from making his contemplated visit to the Pacific, as we announced, two weeks ago, he would do, this fall. Filial duties of an only remaining child of an aged father will not admit of so protracted an absence as was contemplated under other circumstances. Perhaps some other representative of that inststitution, which has so many friends on this side of the continent, may be able to pay us a visit during the coming autumn.

TILTON' JOURNAL OF HORTICULTURE.—The publishers of this journal, the finest and most elaborately illustrated magazine of the kind in the United States, advertise that in order to extend their circulation in California, they will send a specimen number free to any address. It is devoted to Fruit, Flowers and Vegetables. Those who desire to subscribe after seeing the specimen will address *Tilton's Journal of Horticulture*, Boston, Mass." No Californian, who owns an acre of land, will resist the temptation to subscribe, if he once sees this journal.

Communications.

Letter from White Pine.

[Written for the Mining and Scientific Press.]

Eds. Press :—The great "strike," which with many has been used to "bear" White Pine stocks in the San Francisco Boards, has passed, and is heard of no more here. The members of the Miners' Union declare that, as a body, they were opposed to violence, and those who at the last demonstration drove the men out of the mines, at night, now lie in the county jail. There are quite a number of miuers using the strike as an excuse at a distance; but miners are plenty here at four dollars per day.

The California Co. make the completion of their "Fine Building" an excuse for not developing their mines; the few buckets of water which they have secured, by eiuking, has been puffed to thousands of gallous, and has stopped the artesian horing. They now advertise for parties to sink a shaft for water, and when the house is done, will no douht wait for the completion of the White Pine Water Works, and then for springs. All such companies are a detriment to a mining district. The Water Co. have their water now at the summit of Fossil Hill, or the main ridge, and will have it running in Hamiltou next week, and most likely to Treasure City by the first of October.

Important Mining Decision.

The District Court is having a great deal of hueiness this fall. The principal cases, and those which will bring out the poiuts to decide many others, are the Aurora Consolidated against the Earl; Pogonip and Othelo *vs.* West Point, and Original Hidden Treasure *vs.* Rathhurn. Judge Beatty has already made oue rule that is causing a great deal of feeling; and well it may, for it jeopardizes the title to nearly every property in the district. He rules that a location consists of but two hundred feet, and that *two days labor must be performed for each location, and the same be recorded, to hold the mine one year.* There are over 1000 mines recorded here, and of these a majority have performed but two days' work to hold the whole, and have recorded but the two days' work. The Judge will not admit that the custom, as shown hy this fact, or that only some ten or twelve parties recorded more than two days' work, amounts to anything. When it was proposed to produce the men who made the law, he simply remarked that if they made laws which they did not understand, they must ahide the cousequences. By far a large majority of the mines incorporated in San Francisco are more liable to relocation, and in case of dispute the original locators would lose their property, on that point alone, if the other party had performed the two days' work for each two hundred feet.

Mining Operations.

The Aurora Consolidated have purchased the Colfax mine, since my last, for $12,-000, and will no douht now win their case. Hidden Treasure is very doubtful and complicated. J. W. Bailey, agent of the Treasure Hill M. & M. Co., left for the East last Monday. He has secured the best property on the Hill. E. B. Blaisdell now has charge of their mine and mill. The mill has been changed to wet crushing, and Mr. Porkins, the company's amalgamator, informs me that he crushes about forty tons of ore per day. The company's mine furnishes sufficient ore to supply the mill, besides piling up constantly for winter. They now have upward of one thousand tons out, and are extracting about three hundred tons daily. I see that one of the mines deeded to them still has a value in the Stock Board. I refer to the Industry. The Mammoth have struck some very rich ore this week, and are finding it in quantity; they have some eight tons on the dump. It very much resembles the pure chloride found in the Emersley, but carries more horn silver. I understand that a new superintendeut has heeu appointed for the mine, but he has not yet made his appearance. A rich deposit is also reported in the Bulwark miue, of the John Dare Co. The Silver Vault Tunnel have fouud some ore, but uothing of importance; they expect daily to tap something rich. The Eberhardt have a few men at work taking out ore and, by the first, will resume straight work. Mr. Bicknell, who has had charge of the mine, left today for the East, and Mr. Stedman, a thorough, practical miner, takes his place. The Mazeppa (uot the incorporated one—for few here know anything about that) are doing but little. They no doubt desire to sell, hut give out that they will work the mine next month. The mills are well supplied with ore.

September will show the strength of White Piue. Two of the smelting furnaces, at Swansea, are now experimenting on ores from the Base Range, and each claims to be successful. J. M. Dawley left yesterday with four men to start up the mill at Paranaghat. They will run the mill and mines with Chinese labor. D. S. Ogden is also about to start up the Morey Mines at Belmont. Col. Buel is on the way out from Europe, to turn over the El Dorado Sonth, and other miues belonging to himself, with the mill, to a London company. Our shipments this month will not exceed $300,000.

G. B. E.

Treasure City, Aug. 13th, 1869.

The Explorer's, Miner's, Miller's, and Smelter's Friend.

Written for the Mining and Scientific Press.

Editors Press :—The above is the name given to a machine that has been devised for the honelit of the mining puhlic generally, but which is more especially valuahle for the prospectors of this great and virgin mining country. Beyond the regions that have been, and are now being explored, the primitive Rocky Mountains arise, uplifting their east and west declivities of secondary strata, loomiug in the distance to entice forward the more adventurous, where, if the historical analogy of the mining world should he their guide, two larger, more interesting or legitimate fields for their labors cannot remain unexplored, anywhere.

It has been correctly observed by some of the hest and most practical authors on mineralogy, that however exporienced a miner may be in the visual discrimination of gold and silver ores, he is often deceived in his judgment of the value of rock; and this applies to ores of much greater value than such as will pay for mining and reduction, as the mixed ores of volcanic regions, and the antimonial, copper, lead and iron ores, where the precious metals are completely concealed. These authors also commend the common mouth blow-pipe, as an inseparable companion of those requiring greater certainty in mining operations, as well for quantitative as for qualitative assaying of most minerals, hut more particularly for silver, which it performs with surprising accuracy. Its powers are truly wonderful, but proper instruction, great practice, and expensive tools are imperatively necessary, as well as the peculiar qualifications for handling, manipulating, smelting and cupeling an assay of hut one grain, and where the resulting button is eo small that the one-thousandth of a grain would be but $37.70, and the one-ten-thousandth $3.77, per ton of 2,000 pounds. I know of no other single chemical operation that requires more knowledge, practice, care and watchfulness, to ohtain exact results. These, with many other difficulties to which there is no "royal road," and the greater need for preparing a correct homogeneous eample, to render the eample of one grain the correct representative quality or ratio for the ton, have and will prevent its general application.

The crucible and scorifier require a large furnace and muffle, with numerous tools, etc. They are slower in action, and consume a large quantity of expensive fuel, which must be prepared, or carried from place to place, as required; so it is far worse than the former, as all are thus prohibited from its use.

The humid or chemical methods demand many costly and fragile tools, with dangerous liquids, an especial education and general knowledge, or they will he mere useless things.

Thus the explorers have been roaming ignorantly, where knowledge is most desirable, and the legion of mining companies have forwarded mills at a cost of from $20,000 to $100,000, to assay au average from their ledges, to prove most disastrously to them that but *one* in fifty are valuable; aud millions of tons have been reduced that would not pay by either milling or smelting, for waut of an easy means to ascertain its value.

In view of the immense demands of this country, and knowing the insufficient methods in use by miners, millers and smelters, *when required for prospecting*, as well as the first and most important difficulties of my students in their manipulations with the common mouth blow-pipe, I have contrived this machine to overcome all the real obstacles appertaining thereto; such as a continuous hlast, preparing and fluxing the assay, shaping its holder and charcoal support, cupels, etc., as well as holding and varying its position during the smelting, cupeling and refining operations; and ascertaining by tahles, which lie under and on either side of the balanced button, as it rests on the beam, the value in dollars per ton, or its 1,000th fine, for silver and gold, and percentage in base metal assays, all being read at sight without calculation. In addition to this I have two diverging metallic straight-edges, laid on a bed, so that the one end may represent $100 and the other $10; the intermediate space being graduated from $10 to $100, and wherever the button *jams*, its value is recorded on the scale. There is also a hole at the end of this plate of euch size that a $40-button may just drop through, when the explorer may proceed in his questings for other ledges, as this is not sufficiently rich to pay for mining and milling of silver ores in the interior.

By these combinations the apparatus has surpassed my expectatious, as to the quantity of ore it will reduce. I have operated successfully on twenty grains, although it is arranged for ten grains to the puhlic, and I claim that with these arrangements and combinatiou of automatic movements and calculator, a man of ordinary skill can make an assay with this apparatus anywhere, even on the ground, sufficiently near for all the practical working purposes of those to whom I have dedicated it, and in less time and at one-tenth of the cost of any other method. So portable is the apparatus that the whole machine, with fluxes, tools and scales, (weighing less than seven pounds) is packed for conveyance within a cubo of 5½ inches. The price of the whole is $100, accompanied by a hook of instructions for assaying gold, silver, copper, and lead. Those buying a machiue in the city of San Francisco, having the further advantage of seeing an assay made with it by its inventor and patentee.

J. S. Phillips, M. E.

San Francisco, Aug. 17th, 1869.

The Mines of Colorado.

We are permitted to copy the following from a private letter dated Empire City, Colorado, August 2d, 1869 : "Denver is situated on tho plains fifteen miles from the foot of the mountains. Empire City is in the mountains 49 miles west of Denver, and about a mile off the Denver and Georgetown road. A daily coach runs from Deuver to Empire; fare ahout ten dollars. Georgetown is seven miles from here, and is claimed to be a rich silver mining camp. Ten miles west of this place is another rich silver mining camp, the ores of which contain less hase metal, but will yield only 60 per cent. by raw amalgamation. The mines here are gold, with but little silver; the veins are large,—from three to twelve feet thick,—and are easily worked. There is one here, the Conqueror, down 225 feet, and so soft that the ore is spaded up. One would think we ought to make money with suoh advantages, and so we can, when we are able to work the ore and get 80 to 90 per cent. of the gold. The ores are pyrites of iron, with some copper; but the copper pyrites are found only in spots. The gold is very fine, and the ore contains a large amount of sulphur and sulphate of copper, with sometimes a little native copper in thin scales or sprigs ou the face of the wall; but not in the vein. This is the kind of ore we have; and it only varies in the amount of sulphur and sulphate of copper. The bullion we get here is .850 to .880 fine—at Central City. At Black Hawk and Nevada it is not so fine. Those places are fifteen miles northeast of this place and forty miles from Denver; they are large mining camps, and have the same kind of ores with some galena, and the miners meet with the same difficulty in extracting the precious metals that is encountered at Denver. Their tailings are worth about twice as much as they get in the stamp mill. Twenty-five miles north of this place there is another very rich mining camp, where they still have the same difficulty. Twelve miles northwest of Central City there is still another of tho same kind; and south of here, twonty to ouo hundred miles, is a vast country of the same kind, only more so. They cannot get as much in the mill as we do; while the ores assay twice as much. They have both gold and silver. Now these ores contain flour gold, iron and copper pyrites, some arsenic and antimony, a large amount of sulphur and some free gold, and what we want is some one who can work these ores up to 80 or 90 per cent."

Selection by the Stock-breeder and by Nature.

The *London Quarterly* has an article on Darwin and his gradually winning doctrine of Natural Selection, from which we qnote the concluding portion: "Man can accumulate variations either in the root, the leaf, the flower, or the fruit of plants, their color, odor, or taste; in the size, swiftness, or scent of dogs; he can alter the bill, the feet, the tail, or the habits of pigeons; can increase the milk of the cow or the fat of the pig; can alter the length of ear in the rahbit and of horns in the hull, or can attend to two or even more of these points at once. In like manner the law of 'survival of tho fittest,' hy simply determining which out of the immense surplus annually born shall be the parents of the next generation, must lead to the modification of every part of an animal's organization that affects its welfare—that is to say, sooner or later of its whole organization. So long as the changes of land and eca of which geology assures us, and their concomitant changes of climate, of soil, and of vegetation, and of tho distribution of animal forms, are going on, each species in turn must be exposed to new conditions and new dangers, must have to live upon new food, or to struggle with new enemies. Those whose organization is sufficiently flexible to furnish in each generation favorable variations, will become adapted to the new conditions, and will appear as the new or representative species of the naturalist; such as could not vary quickly enough would die out, and furnish the extinct species whose remains the palæontologist disentombs.

"Here we have at all events a real and a powerful cause in action, and one which is accurately defined, and has been copiously illustrated by observation and experiment. No occult powere are postulated, hut instead of them demonstrable groups of facts; and Mr. Darwin has developed his theory so fully, and has shown it to he in accordance with such a vast mass and variety of phenomena which on any other hypothesis are unintelligible, that it has commanded very general acceptance, ospecially among goologists with whose genoral doctrine it so well harmonizes."

How to Obtain a Correct Photograph. Whoever has seen or sat for his photograph has of course noticed the look, so unlike a likeness of himself, which he puts on when he faces the daguerreotype apparatus, at the moment the portrait is to he taken. "That's what's the matter" with so many of the sun-pictures which though daguerreotypee are yet no likenesses. It is only at that particular point of time in his life that the sitter ever did look just eo, and, as he never did before, and never will again, should he be surprised to hear his friends say that his photograph does not look like him? To do away with this stereotyped solemnity of sittere to the daguerreotype, we read that an artist of Cleveland, Ohio, has adopted the expedient of a large mirror, mounted on a moveable stand, which is wheeled to the side of a camera, and the sitter is thus enabled to see himself as others see him. The effect is said to be extraordinary on any sitter. The stern scowl is suddenly changed to a pleasant smile, and when that desirable object is attained the impression is suddenly fixed on the plate.—*Ex.*

Starch Luster is a substance used for washing purposes, which, when added to starch, causes the linen to which it is applied to assume not only a high polish but a dazzling whiteness. A portion of the size of an old-fashioned cent, added to half a ponnd of starch, and boiled with it for two or three minutes, will produce the best results. This substance is nothing more than stearine, colored hy a slight additiou of ultramarine blue, the essential ingredient being the stearine; and with or without the coloring matter will be found to add very much to the beauty of linen articles to which it is applied. Stearine is to he had at any good drug store.

Mechanical Progress.

Engine Efficiency Independent of Boiler.

In the ordinary mode of comparing the duty of steam-engines by determining the quantity of coal necessary to develop a given power, the efficiency of the boiler is not distinguished from the efficiency of the engine. Messrs. B. W. Farey and Bryan Donkin, of England, have recently made some interesting experiments with an apparatus designed to measure directly the heat carried away in the condenser. Measuring at the same time the work developed by the engine, by means of indicator diagrams, all the elements are ascertained, necessary for determining the efficiency of the engine independently of the boiler. The quantity of water passing through the condenser is measured by conducting it over a weir or notch. The temperature of the condensing-water on entering the condenser, and that of the mixture of injection-water and condensed steam leaving the condenser, is ascertained by ordinary thermometers; lastly, the work done in the cylinder is ascertained by indicator diagrams. Dividing the horse-power developed in the cylinder, expressed in thermal units, by the quantity of heat imparted to the injection-water in thermal units, the quotient expresses nearly the efficiency of the steam. And since the efficiency of the steam in the same engine does not vary much for moderate variations of power, when the efficiency of the steam has once been ascertained, the measurement of the volume and temperature of the injection-water affords a new means of ascertaining the work done by the engine. Messrs. Farey and Donkin have therefore contrived photographic registering apparatus, by which the volume of flow and temperature of the injection-water are continuously recorded; the data so obtained being used either to determine the efficiency of the steam, or, if the efficiency of the steam is known, to determine approximately the power of the engine.

Boiler Explosions.—The *Artisan* says that there is no doubt that the *leakage* in boilers has saved thousands of lives, by the prevention of explosions. The pressure is thereby prevented from becoming excessive. If a boiler be filled to complete repletion, with all escape for steam closed up, it may be heated to nearly any extent above the boiling point of water without the generation of steam, and without further indication of pressure than what is produced by the expansion of water by heat. If, however, a valve or cock be now suddenly opened, the whole liquid contents of the boiler will be simultaneously and instantaneously transformed into vapor, occupying 1,700 times their original bulk.

There are many reasons for believing that a majority of the disasters which are recorded as having taken place after leaving boat landings, or railroad depots, or soon after starting engines which have been at rest, is attributable to the cause we have just mentioned, and that the simple expedient of *always leaving some issue for the passage of steam while fire is under the boiler and the engine is at rest*, will be sufficient in itself for the prevention of such accidents. Steam is more rapidly "got up" in a boiler with its safety-valve partly open than when it is closed down tight.

Leather for Belts.—J. H. Cooper gives in the *Journal of the Franklin Institute*, the experiences of a practical man upon the matter of the selection of leather for belts:—"The leather should be oak-tanned; and should be made from young hides, not from those of old animals. Suitable leather having been chosen, though it may be ever so good, it may be spoiled in currying; and as this is an important part, it is conducted under my own supervision. I have the *shoulders* cut from the hides, and nothing but FOUR *feet in length of the choice butts*, curried for belting purposes; as the *shoulder, naturally stretching in a different direction* from the butts, causes great annoyance, the belts running crooked.

The putting on of belts should be done by a person acquainted with the use of belting, and too much judgment cannot be exercised in this respect. The butts to be joined together, should be cut perfectly square, in order that one side of the band may not be drawn tighter than the other. For the joining of belts, good lace leather, if properly used, being soft and pliable, will always give better satisfaction than any patent fastening or hooks which have yet been invented."

Delicate Balances.—The New York *Mining Journal* says: A balance which lately came into the possession of Bowdoin College, Maine, is sensitive for one-tenth of a milligramme, with a charge of ten kilogs. in each scale; that is, to the twenty-millionth part of the whole charge. The University of Upsala, in Sweden, has two balances, each carrying one kilo. in each pan, and sensitive for one and a half milligrm. We are, here in New York, far ahead of that. Balances can be bought here which, when charged with one kilo. in each scale, are sensitive for one-tenth of a milligrm. These balances are, therefore, fifteen times more sensitive than the Swedish ones. We have in our own office a balance which, when carrying 100 grammes in each scale, is sensitive to one-tenth of a milligrm., and, of course, much more sensitive when charged with a less weight. In any event they surpass the statements made by our English and French contemporaries. We will only add that the common assay balances now in use in the United States assay office in New York city show a difference in load of less than the one-hundredth part of a milligrm.

The Nichols Steel Patents.—"Five patents,"—says the Canton (Ohio) *Republican*,—"have been granted to Mr. Nichols and the Malleable Iron Co. One is for converting white cast iron into steel. The article is taken right from the foundry floor and packed in annealing pots, and then placed in the ovens precisely after the manner of making malleable iron, differing only in the chemicals used in the pots. We were shown plow points thus made that were heated under our observation, hammered to a fine edge, and thus tempered so hard that after breaking off a point to see the quality of the steel we readily scratched our name upon the window glass. We were also shown many other articles, among them knife-guards used by reaper and mower manufacturers, and by them made of wrought iron at great expense.

By far, however, the most interesting experiment we witnessed was under a patent for refining steel or restoring burnt steel. We saw a piece of steel broken, one-half of which was thrown into the fire and burnt until the particles looked lifeless and granulated easily. This same piece was again heated and plunged into the chemical bath, and in a moment came forth, not only restored to life, but in comparison to the piece held in our hand, much finer, and upon test much superior in strength."

The Centrifugal Extractor.—This machine, which has long been in use for sugar-making and clothes-wringing, has been applied, in France, to the extraction of the juice of grapes and apples for wine and cider-making. It is said to answer the purpose admirably; doing, on a recent occasion, in two hours, the work which, with the wine press, requires seventeen. The juice was moreover all of the same quality; while with the press, it is only the first runnings which will make wine of the best quality, the long contact of the rest with the skins and stalks rendering it fit only for wines of inferior quality. In the case of cider, the use of the machine seems equally advantageous.

Connecting the Ends of Cylindrical Boilers.—The flat ends of cylindrical boilers are sometimes connected with the barrels and flues by means of rings of angle-iron; but such rings are liable to split at the angle; and therefore it is considered preferable to make the connection by bending the edges of the endmost plates of the barrel and flues, or by bending the edge of the flat end. A flat end to a cylindrical shell, or a flat top to a steam-chest, connected by means of an angle-ring alone, without stay-bars or gussets, is dangerous at high pressure, even when of small diameter; as the angle-iron ring, although it may last for a time and be apparently safe, is almost certain to split at the angle in the end.—*Artisan*.

Castings Instead of Electrotypes.—The *Boston Journal of Chemistry* for August 1st, has some illustrations printed from *cast* cuts made by a new process. It remarks upon them as follows: "It will be seen that the cuts are as clear as are afforded by the electrotype process. By this method the most beautiful and perfect castings are rapidly made, and the new art promises to be of the greatest utility. The two principal points of interest in the invention are the use of *fine potters' clay* instead of sand for the mold, and the injection of the molten metal at the *bottom* under *great pressure* by a piston moving in a cylinder."

Scientific Progress.

The Eclipse at Des Moines.

The results of the observations made at this point are reported as highly satisfactory. The weather was perfect, and the sky clear; and the scientific gentlemen who constituted the corps of observers, made the most of their opportunity. Every possible preparation had been previously made. Six large telescopes were mounted at Prof. Harkness' observatory, an equal number at that of Prof. Newcomb, and three at the private observatory of Dr. Peters. The Chicago *Times* gives a description of the day and the doings, from which we copy the following paragraphs: "There was a steady but slow diminution of light down to about half a minute before the beginning of totality, when suddenly, as if the wings of darkness or the shadow of an impenetrable cloud had passed over the earth, the darkness became so great that the operators could not read the scales on their thermometers, and the photometers indicated a light considerably fainter than that of the full moon. Lanterns had to be employed by all the operators in order to carry on their observations. Venus appeared in all her radiance to the east of the sun, and Mercury shone out about six degrees to the west, as conspicuously as a star of the first magnitude. * * As the corona flashed into view there was a murmur of admiration from the spectators. It seemed to be a halo of light, whose rays were different in length, and variable in brilliance. From the northeast limb of the sun a long, conical mass of light, perhaps half the diameter of its disk, shot off in the direction of the zodiac. From the opposite side a similar smaller mass projected, and from the north of its disk, a column of burning rays shot, something like a miniature auroral light. Between these was a circle of smaller rays, which made the ring complete. But the phenomena which attracted most attention, were the long points of rose-colored light,—as distinguishable from the white light, even with the naked eye, as a white rose from a red one. From the southern point of the sun's disk appeared a tongue of flame about one-twelfth of the sun's diameter in length; this was plainly visible with the unassisted eye. Through the telescopes it assumed the appearance of a fleecy cloud illuminated by a pink light. From the eastern side of the sun were two prominent crimson points. From the west and south were two smaller ones, and one which assumed the shape of the two horns of an ox, proceeding from the same point. This latter was cut off by the sudden appearance of the sun's edge, and the conclusion of the totality of the eclipse. Instantly Mercury was invisible, and Venus disappeared in three minutes and forty-five seconds afterward.

The calculations of the astronomers in regard to the time of the commencement of the eclipse were almost exactly verified; but the duration of the total eclipse was about five seconds less than the calculated time; which would throw the center of total obscuration about seven miles farther east than was estimated.

Prof. Harkness made elaborate observations with the spectroscope. He found that of five of the rose-colored protuberances, each gave a different line. Dr. Curtis took photographs of the sun at short intervals,—in all, 123; two of which were during the totality. Prof. Eastman made observations every ten minutes with the thermometer, barometer, photometer and actinometer.

It is believed that this occasion has added important facts to science. We shall look with interest for the official reports.

Mineral Caoutchouc.—The *Chemical News* says this substance has been recently found in South Australia exuding from the sandy soil and collecting in quantity upon the surface. It yields 82 per cent. of oil. According to the analysis of the late Professor Johnston, it is a hydrocarbon, containing from 83·7 to 85·5 per cent. of carbon, and from 12·5 to 13·28 per cent. of hydrogen. The variety found in Derbyshire has a specific gravity varying between 0·9053 to 1·233; the substance is highly inflammable, its color blackish brown, its luster resinous.

To Obtain Oxygen without Employing Heat.—Böttger takes equal weights of peroxide of barium and peroxide of lead, and having mixed them together adds some very weak nitric acid. Active effervescence immediately commences, and it is found that the gas evolved is pure oxygen. It will be seen that, according to Schönbein's theory, one of the peroxides employed evolves ozone, and the other antozone, or oxygen in the positive and the negative states, and these combine as they are given off to form neutral or ordinary oxygen. This process is of more scientific than practical interest; but it may be useful perhaps when small quantities of oxygen are required for medicinal purposes.—*Artisan*.

To Deodorize Bi-sulphide of Carbon.—A new French process is as follows: The bi-sulphide is washed several times with distilled water, and is then transferred to a large retort containing lime. After twenty-four hours' contact with the lime, it is distilled, and received in a flask partly filled with copper turnings (previously roasted to remove all fatty matter, and afterwards reduced by hydrogen), when all odor, except a faint ethereal one, will have been taken away. The lime becomes highly colored. By the aid of this deodorized bisulphide, Millon and Commaille have succeeded in separating the perfume of milk, and have even detected it in the odor of particular flowers (*Smyrnium olusatrum*, for example), which had been eaten by the cow.

New Mode of Producing Oxygen.—Messrs. Montmagnon and Delaire produce oxygen from the atmosphere by means of charcoal and water. They state that 100 litres of fresh charcoal, when exposed to atmospheric air, will absorb 925 litres of oxygen and only 705 litres nitrogen. If the charcoal so saturated with gas is then saturated with water there will be expelled 650 litres of nitrogen and only 350 litres of oxygen. Thus 575 litres of oxygen and only 45 litres of nitrogen are left in the charcoal. These gases they remove by the means of an air pump, when the charcoal is again ready to absorb oxygen and nitrogen from the air.

The Apomecometer.—A new instrument for measuring vertical heights, as for instance of towers or spires, is thus described by the inventor: "It is constructed in accordance with the principles which govern the sextant, viz., as the angles of incidence and reflection are always equal, the rays of an object being thrown on the plane of one mirror, are from that reflected to the plane of another mirror, thereby making both extremes of the vertical height coincide exactly at the same point on the horizon glass; so that, by measuring the base line, we obtain a result equal to the altitude."

The North Polar Expeditions.—There are five different parties now in the high latitudes. Three of these are German and two are English. The first, Rosenthal's, from Bremerhaven Feb. 21st, was heard from, May 9th, at 74° N. The second, Lamont's, sailed from England April 20th. The third, Capt. Palliser's, also sailed from England in April. The fourth, Rosenthal's also, sailed from Bremerhaven May 23d. The fifth left Bremerhaven June 15th.

The Power of Electro-Motors.—Mr. Henry Wilde says that he has found that whenever a voltaic battery and a magneto-electric machine will melt an equal length of wire, the power which these electro-motors have to overcome external resistance is also equal. And generally, the power of an electro-motor (whether voltaic or magneto-electric) to overcome external resistance, is directly proportionate to the length of wire which it will melt.

Decomposition of Chloride of Iron. When heated to 70° Cent., chloride of iron is decomposed into hydrochloric acid and soluble oxide of iron. M. Debray sends a note upon the subject to the French Academy. He finds that the salt has undergone an entire change at that temperature, giving, instead of Prussian blue with the ferrocyanide, a pale greenish blue. Solutions of common salt cause a gelatinous precipitate of sesquioxide of iron.

Farming and Gardening.

Tree Culture Without Irrigation.

Some people entertain tbe erroneous idea that trees will grow and thrive in this conntry without irrigation only on bottom lands. Recent experiments, however, in various parts of the footbills bave shown that this is a great mistake. Tbe *Banner*, pnblished at Ynba City, says that a numher of persons in that vicinity have fnlly demonstrated the fact that trees planted in good soil either npon high lands or in the plains will grow and flourish without irrigation. "One gentleman, Mr. J. Onstot," says the *Banner*, "living a few miles west of Yuba City, has planted and successfully grown a large variety of fruit, shade and nut-hearing trees, and without the aid of irrigation. Mr. O. is satisfied that the now dry-appearing plains composing the rich deep soil npon wbich onr best grain is produced, can be made to hriug forth a forest of fruitful trees, composing hoth English and black walnut, figs of every variety, apples, peaches, mnlherry, etc. He has set an example, and wishes his neighbors to follow suit. The extensive planting of trees would make, in a few years, a beautiful and lovely landscape of what now appears as a dry plain."

If it can be satisfactorily sbown that trees *can* be snccessfully grown without irrigation upon the plains of the Sacramento and San Joaquin valleys, their growth shonld he enconraged hy State bonnties or in some way, in order to secure their more general planting. There is quite as mnch, and even more, necessity for the adoption of snch a policy bere than there is in Illinois, where tbe law has for some time provided that any person shall he released from taxation for ten years, or $100 worth of property valuation, for each acre of forest trees planted; and for each acre of frnit trees planted, from $50 valuation for five years. The same provisions as to frnit trees are applied to the planting of shade trees and hedges along the highways. It is asserted that there are now maple forests in several connties, and sngar made, where, fifteen years since, was notbing but prairie grass and hazel shrnhs.

Sweet Potatoes at the North.—Mr. J. Allen, of Conneant, Obio, writes to the Farmers' Club as follows: "Hundreds of thousands of sweet-potato plants are grown here in warm and sheltered side-hill gardens for home nse, and for sending by mail or express to nearly all the States. Last year I procnred some seed potatoes from West Jersey, and find that they produce potatoes of a better quality than those tbat have been grown here for several years; and I think that they should he renewed often from that locality of Delaware; for, as good potatoes are grown there as any place." The *Hearth and Home* calls attention to Mr. Allen's letter as showing that the sweet potato is prodnced fnrther north than many suppose. It is a fact wbich should be more generally known that very good potatoes of tbat variety can he raised anywhere, in suitable soil, in tbe Middle and New England States, as far north as the northern line of Massachusetts. We last fall ate very good sweet potatoes raised in Middleboro', Mass., and were told that hundreds of hushels were raised every seaaon in that town; and, if we are not mistaken, their production is becoming quite general tbrougbont that part of the State.

Grapes.—California, it is said, is now cultivating more than 300 varieties of grapes. The total number of vines now growing in the State is set down at thirty millions.

The wool clip of Santa Barbara this year, according to the *Press*, will reach 1,200,000 yonnds—600 tons—which, at tbe current price, is worth $240,000.

A Singular Fact.

The peacb, says the *Waverly Magazine*, was originally a poisonons almond. Its fleshy parts were nsed to poison arrows, and the fruit was for this purpose introdnced into Persia. The transportation and cultivation, bowever, not only removed its poisonous qualities, but produced the delicious fruit we now enjoy.

An excbange, copying the above, states the further fact that where the peach is planted in certain localities [too far nortb] it deteriorates to a coarse, thin, hard-stone almond, which sometimes, hnt not always, acts as a poison to persons eating it, and asks: "Can any of our friends throw light upon the subject?"

In reply to the query, we wonld state that a notable qnantity of bydrocyanic (prnssic) acid, (one of the most deadly poisons known) is found in tbe peach—fruit, pit and leaf. This poison, in fact, is chiefly mannfactured from the bitter almond, a variety of the peach, and the same which might have beeu employed hy the Persians, as stated above, who no donht had some knowledge of manufacturiug this acid. The same acid is also found in the cherry, particnlarly the wild variety.

The reason why persons may sometimes be affected by eating such fruit, while at others they may eat it with impunity, and why cattle are sometimes killed by eating wild cherry leaves, and not at others, is explainable as follows: When the fruit of the bitter almond or tho leaves of the wild cherry are first gathered, they contain but a very small portiou of acid; bnt as soon as maceration has been effected, tbereby breaking down the walls of the cellular tissue, and allowing free access of air, this poisonous substance is rapidly generated. Hence the bitter almond may be eaten with impunity immediately after being plucked; but if eaten after the pnlp has been broken up and allowed to stand thirty-six or forty-eight hours, nnpleasant, if not dangerons results may follow. Cattle may safely browse upon wild cherry leaves directly from tbe tree or immediately after they have been taken therefrom; hut if the leaves are allowed to be trampled upon, or even *dry*, for a day or two, in tbe shade, prussic acid is developed in such quantity as to often result in the death of snch cattlo which feed freely npon them. The somewhat agreeable bitter principle in tbe peach-pit or wild cherry-leaf, proceeds from the prussic acid which they contain.

A Curious Melon.—In a tract of conntry in the sonthwestern part of Africa, distinguisbed for its dry hut rich soil, a gigantic perennial melon has been discovered, wbich is a most delicions, wholesome frnit, and which is largely consumed by the native inhabitants as food. In order that this melon may flonrish, it is necessary that it should strike its roots down throngh the sand *thirty* feet to reach permanent moisture. This it does, and grows in great luxnriance wbere all else is shriveled and parched by heat. But this is not all. If it were simply a huge melon, with smooth and delicate skin, every one would he destroyed by wild beasts before half matnred. To prevent this, natnre has armed its outer rind with a coveriug of long, sharp, terrihle thorns, which so lacerate the mouths and noses of animals that they are glad to leave them alone in all their tempting freshness. Man, with his hands and sharp knives, finds little difficulty in opening the lnscious fruit. The natives have no necessity for putting fences ahout their melon patches, for the plants are self-protective. *Boston Journal of Chemistry.*

Cheating in Hay.—Several complaints have been made in this city and other localities of cbeating in hay, by placing stones in the middle of the bale. A stable keeper in San Josć made the latest discovery of that kind.

Flax Culture in Oregon.—The Pioneer Oil Company, of Salem, Oregon, have several thousand acres of flax under engagement to be harvested for the aeed. It is said to he a more profitable crop, there at least, than wheat or oats.

How to Grow Lima Beans.—A correspondent of the *Rural New Yorker* recommends the following method of raising Lima heans, which may be found useful to those who desire to mske the most of a small piece of ground: "Take an ordinary nail-keg, as near water-tight as possible, hore quarter-incb holes in every third stave an inch from the bottom. Spsde and pulverize tboroughly a circle of ground tbree feet in diameter. Place the keg in the center, filled nearly full of good stable-manure, well pounded in; plant the hesns end downwards, two incbes deep, eight inches apart, and as many incbes from the keg, all aronnd it; ponr on a pail of water, or as mucb as tbe mannre will absorb, wbich may be repeated once a week in dry weather. Place five or six poles a foot from the keg, letting the tops meet over it, and the work is done. Four hills will be fonnd to raise enough for any family. I have adopted the keg and pole encumbers, and find it works splendidly, as you can pick them without distnrhing the vines."

Watering Plants.—A writer in an exchange says: "Plants set against walls and piazzas freqnently suffer from want of water, at this season, wheu even ground near them is quite wet. Draw away the soil from each plant so as to form a hasin; fill in with a hucketful of water, allowing it time to soak gradnally away, and when the surface has dried a little, draw in loosely the soil over it, and it will do witbout water for some weeks This applies to all plants wanting water tbrough the season. If water is merely poured on the surface, it is made more compsct by the weight of water, and tbe harder the soil becomes the easier it dries; and the result is, the more water you give the more it wants."

To Grow Horse Hair (?).—Oftentimes the owner of a valuable horse discovers a spavin or curh make its appearance; a blister is applied, and many times the bair comes off, which, of course, the owner wishes to have grow out as soon as possible. Now, a gentleman of Deumark, N. Y., has furnished a recipe which he claims will cause tbe bair to start right away on bare spots cansed hy blistering, harness gall or otberwise. Take an old boot or shoe, place it on the fire, burn to a coal, pulverize, and mix with hog's lard to a thin paste. A few applications of the paste to the hare place will do the work. Try it.

Lemons from Alameda.—A lot of lemons were received in this city last week from tbe garden of Mrs. Dr. Hall, in Alameda. They sold readily for $1.50 per dozen, and are said to have heen the first of this variety of fruit ever brought to this market which was raised north of Los Angeles.

Sensible.—A largo portion of the farmers in tbe neighborbood of Hayward's bave expressed a determination to put the chief portion of their lands in fruit and vegetables the ensuing year.

New Incorporations.

Blue Mountain Tunnel and Lode M. Co.—August 12. Wbite Pine.

Meetings, Elections, Etc.

Hesperian Land, Savings and Loan Association. Aug. 17. President, Chas. Avery; Treasurer, John McKewen; Secretary, George Strasser.

Great Park H. A.—Aug. 17. Trustees: Cyrus Palmer, Adolph Unger, Richard F. Knox, Wales L. Palmer, A. G. Styles, D. N. Hawley and B. P. Avery. President, Cyrus Palmer; Secretary, Ira G. Hoitt; Treasurer, David N. Hawley.

Sierra Iron Co.—Trustees: N. Lnning, James M. McDonald, L. E. Pratt, Wm. S. Day and Caleh T. Fay.

Paul Reservation H. A.—August 17. Trustees: W. G. Doolittle (President), C. D. Wheat (Vice President), F. B. Wilde (Treasurer and Secretary), J. W. McKenzie, N. F. Flood, John Heuderson Jr., H. B. Sheldon and W. G. Finch.

Garden Tract H. A.—Aug. 17. President, A. S. Gonld; Vice President, John P. Winchester; Treasurer, W. G. Doolittle; Secretary, F. B. Wilde. Trustees: A. S. Gould, W. G. Doolittle, John P. Winchester, J. K. C. Hobbs, F. B. Wilde, J. T. Bradford and W. G. Finch.

California Art-works for Sale.—Wm. Keith, has placed on exhibitiou at the Mercantile Library, prior to the sale at auction, a collection of original Oil Paintings, illustrative of Scenery in California, Oregon and Washington.

Inventions and Patents.

New Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

Copies of U. S. Patent Claims furnished immediately at small cost. Full copies of American or Foreign Patents can be obtained by telegraph or mail through this office at favorable rates.

For the Week Ending August 10th.

Mode of Making Corundum Wheels.—A. W. Calder, San Francisco, Cal.—93,413.

Improved Truck Plow.—M. Mickelson, Ashland Mills, Oregon.—93,464.

Carriage Pole and Shafts.—Angustns Moore and John Aylwerd, San Josć Mission, Cal.—93,466.

Process for Forming the Hub and Spokes of Wrought Iron Wheels.—Tbomas Ryan, Scott Bar, Cal.—93,483.

Steam Cultivator.—Andrew J. Stevens, San Francisco, Cal.—93,494.

Device for Operating Cocks of Steam Cylinders.—Wm. H. Woods, San Francisco, Cal.—93,509.

Metallic Stuffing Box.—W. H. T. Clark, San Francisco, Cal.—93,518.

The object of this invention is to provide an improved stuffing-box, or packing for the piston rods of steam engines, pumps or propeller shafts, and for making a tight joint in all cases wbere there is a rod or shaft working, partly within a medium under pressure, and partly outside of that medium. The stnffing-box is constrncted with a gland or follower, as in the cylinder head of a steam engine. Within this stuffing-box is placed a short cylinder with a cover at each end, and containing the packing rings, which may numher ten or more, five in each of the two compartments, into which the cylinder is divided. The piston-rod passes through tbe ends of this short cylinder, and also throngh the contained rings, which are cut at various points on their circumference, aud are kept close to the rod hy encircling springs, so that the rod passes perfectly steam tigbt through the cylinder. The two ends of the packing cylinder may be faced or have an elastio packing, which makes it steam tight against the interior face of the gland, and the end of tho stuffing-hox. The openings through tbe gland hy wbich the rod passes out from the stuffing-hox, are considerably larger than tbe rod, so that it will not press against the sides, if any portion of tbe machinery gets out of line.

Passenger Register and Railroad Calendar.—John C. Hackett (deceased), Sacramento City, Cal. [Address Henry Hackett, Gold Run, Cal.]—93,531.

This invention is designed to provide an improved mechanism to be attached to railroad-cars, by which the various stations along the line may be indicated to passengers, without their names being called out by tbc conductors. By tbe same device the number of passengers that enter a car is also indicated, as well as the station where they enter and leave. To accomplish these objects, circnlar disks are provided upon which the names of the various stations are painted. One of these disks is placed hy the side of each seat, and within tbe wall of tbe car, with a small longitudinal opening in front, and all, in any given car, are turned simultaneously hy brakemen, so that the name of each atation is snccessively brought before the opening aforesaid, where it may be read by each passenger as he remains in his seat. Springa and levers are also employed to so connect each aeat with its appropriate disk, that when a seat is turned down for occnpancy hy a passenger, the act is recorded on a strip of paper connected with the disk. This invention was more fully described and illustrated in our issue of June 27th, 1868.

Mortising Chisel.—Carl Hinz, San Francisco, Cal.—93,534.

The object of this invention is to provide an improved chisel to he used for cutting mortises designed for receiving pulleys or other pieces of mechanism, wbich require a shallow mortise cut around the border of the main one, for tbe purpose of receiving the flange or other device by which the pulleys are attacbed to the timber. The invention consists of a mortising chisel having a shorter adjustable one above it, and placed far enough from it to give the desired widtb of shallow mortise. By adjusting the shorter chisel, any desired depth or width of shallow mortise can he given; the whole heing performed at one operation and with great accuracy and celerity.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, August 21, 1869.

Financial.

The charity of our business men has been severely tested within the past week by the concession of very important financial aid to the firm of J. Seligman & Co., while like assistance has been withheld to other banking firms, and, proportionably, to the whole business community dealing with those banks. Application was made to the Treasury Department for permission to deposit $3,000,000, in gold, in the New York Sub-Treasury, and draw the same amount from the Sub-Treasurer in San Francisco, who holds between $11,000,000 and $12,000,000 in coin, paid by the merchants of this city to the Government for customs duties. To this reasonable and business-like request, which, if complied with, would have saved 1½ per cent.—equal to $33,750 on the whole amount—to the Government, no reply has been received up to date; but upon a like application from J. Seligman & Co. the amount of $500,000, in two transfers, was turned over to that firm upon telegraphic order from Washington. The reason for this special favor has not transpired, but we are very far from condemning the act of that firm, which has only had the good fortune to succeed in obtaining what everybody else was trying to get. But whether the authorities at Washington have done justice to the business community of San Francisco in this transaction is another question, and one which cannot be properly answered until the reasons have been made known. Until then we do not choose to indulge in remarks which may be unjust or ill founded.

We note a large private remittance of $250,000, in round numbers, direct to France. A French banker, who has long been established in this city, became displeased at the small amount of business he was doing in proportion to the capital involved, and has determined to transfer his operations to the other side of the Atlantic. The remittance in question was the first installment.

Our local money market remains hard and distressed. The discount line is in a sickly condition; not because the banks are unwilling to accommodate, but because the coin supply is deficient. Bullion is not abundant, while the demand is active. We quote gold hars at 850; silver bars range from par to ½ per cent. discount; currency bills on Atlantic cities are charged 31@31½ per cent. premium on gold; coin drafts, payable at sight, pay ¾ per cent. premium; telegraphic transfers are effected at 1¼ per cent. premium; sterling exchange is quotable at 48¾d, and commercial exchange is done at 49½@50d; Mexican dollars command 6@7 per cent. premium; gold in New York, August 19th, 133¼; legal tenders in San Francisco, 74@74¾.

The exports of Treasure from Aug. 1st to date have been as follows:

Aug. 4—Per Oregonian—		
To China	$346,973 30	
To Japan	326,403 93	
		673,377 23
Aug. 1 to 5—Overland to New York		63,246 65
Aug. 9—Per Sacramento—		
To New York	$ 48,047 15	
To England	449,987 83	
To Central America	181,625 42	
To Panama	20,000 00	
		679,660 40
Aug. 6 to 11—Overland to New York		86,503 33
Aug. 18—Per Golden City—		
To France	$260,290 47	
To Central America	10,000 00	
To Panama	10,000 00	
		280,290 47
Aug. 12 to 19—Overland to New York		20,000 00
Total since August 1st, 1869		$1,803,078 08
Previously this year		23,616,473 70
Total since January 1st, 1869		$25,419,551 78
Corresponding period, 1868		25,202,384 83
Increase this year		$ 217,166 95

When our Chicago commercial visitors arrived at White Pine, with a view of estimating the volume of its argentine product, and to determine, if possible, the nature and conditions of the traffic the Chicagoese could hope for from that district, they were frightened out of investing, by the stand which the miners had taken. They saw a large body of men refusing to work for four dollars, gold, per day, when operatives in the lead mines of Illinois were asking and receiving about half that amount. They saw, furthermore, that although the country is unprecedentedly rich in silver, San Francisco capitalists exhibited a strange lukewarmness in its behalf. Piles of ore, averaging about $80 the ton, lay heaped on all sides, but the facilities for extracting the precious metal were disproportionably few and scarce. Those adverse features were apparent—plain to the sight; but the marrow remained hidden from view, and did not suggest itself to the superficial gaze of the Chicagoese. They did not stop to consider that nearly all the mills are old, second-hand affairs, incapable of steady working, and that the district can keep nearly four times as many good mills in constant operation. They did not wait to inform themselves that, despite the very inadequate means at hand, White Pine will turn out $4,000,000 worth of silver this year; nor did they arrive at the cheering knowledge that, under favorable circumstances, with their capacities in full development, the White Pine mines are capable of yielding from $10,000,000 to $12,000,000 of silver per annum. While boasting their ability to furnish machinery and other articles cheaper than San Franciscans, they delicately hinted an indisposition to make the venture, on the purbliud plea that White Pine was very distant from Chicago and the people of that district were so much strangers to Chicago dealers that credit could scarcely be expected. Yet, if their own protestations are to be believed, neither distance nor newness of acquaintance were to be insuperable obstacles against extending their trade. Their visit to San Francisco, far west of White Pine, was for that very object. They were going to skim the cream of trade from the Great Basin and all other points between Chicago and this city. They were even to invade Nevada, and carry off all its bullion, as the reward of their overmastering enterprise. They evidently had no clear perception of San Francisco; probably thought it was a bloated village devoid of manufacturing resources, and almost wholly dependent upon Atlantic cities for all manufactured articles. A visit disabused them of such false impressions; and it is quite likely that the change in their tone toward the White Pines was more due to their suddenly acquired knowledge of incapacity to compete successfully with San Francisco, than to any indisposition on their part to exchange manufactured goods for silver bullion. Most people will indulge, now and then, in a little bombast, and the Chicagoese are no exception to the rule. White Pine is settling down to its real work. The foam and bustle under which it was concealed, for a time, have been wiped off, and its real merits are beginning to exhibit themselves in tangible form. Machinery and capital are needed to bring out and utilize its vast resources; but these will be supplied liberally in due time, and every facility will be given to unload the teeming earth of that district from its silvery burden.

City Stocks.

This class of securities has not attracted any great attention during the brief period since our last reference, and transactions made came from private hands.—The California Steam Navigation Co. dishursed its usual 1 per cent. dividend on their capital stock on the 16th inst.

Mining Share Market.

Mining stocks are in much better favor than at the close of our report last week. Most shares show a decided advance, but the transactions are not on such an extensive scale, more caution being exhibited by all classes of dealers. The stringency of the money market still greatly retards stock operations, and in many instances during the falling market it went quite hard with many dealers, who were obliged to sacrifice stocks which could otherwise be held. An improved condition of the money market is looked for within sixty or ninety days.

HALE & NORCROSS—exhibits a very considerable improvement. For the week ending August 14th, the upper mine yielded 261 ½ tons of ore, and the lower 321¾, making a total of 583½ tons. Previous week the yield amounted to 690½ tons. They delivered 1,008 tons, leaving on hand 8322½ tons of low grade ore. Work on the fifth level has been interfered with on account of retimbering the shaft. The various breasts on the fourth level present no material change. A raise has been made in the old vein a few feet south of the northern boundary line from the third level, which is now up some eighty feet. From this raise three cross-cuts have been made at equal distances, and these openings have disclosed a vein of ore from four to seven feet wide, the average assays showing $51 to the ton. In the old mine, on the 400 level, the winze in the south drift is down twenty feet and in ore, the width of which is reported to be 3½ feet, assaying $47 to the ton.

CHOLLAR-POTOSI—sold at very uniform price, in very considerable amounts. During the week ending August 13th, 1,640 tons of ore were extracted against 1,408 the previous week. The product of the week under review shows that 1,035 tons came from the Bluo Wing locality, and 305 from the New Tunnel. The Blue Wing deposit is looking well and is yielding largely. The new section under the New Tunnel exhibits considerable improvement. On the 13th inst., $30,589 in hullion was dispatched to the office in this city.

GOULD & CURRY—was in moderate request at an advance. During the week ending August 16th, they extracted 347 tons of ore against 377 the previous week. No change of importance has taken place since our previous reference, the ground from which the ore is taken being quite as promising as heretofore. The second station is being re-opened, some seventy feet having been opened during the week under review. The seventh station has been completed, and a drift carried north about nine feet; no signs of ore yet. To date, for the current month, the hullion returns aggregate $11,524.—On the 17th inst. the OPHIR drift had been carried in a total distance of 535 feet; rock getting harder.

The *Inland Empire* of a late date has the following about several prominent White Pine mines: "We made a flying trip to Treasure Hill, and paid a visit to four mines—the Posthole, Eberhardt, Pogonip and Othello, and Original Hidden Treasure. In the Posthole we found a full complement of men at work and rich ore being taken out. This mine had some 265 tons of ore crushed within the last thirty days, the highest grade yielding upwards of $1,600, the second grade $194, and the lowest grade $124 per ton. The Eberhardt had its principal force at work in its great chamber, where more rich ores are exposed than ever before. No work is now being done in the 175-feet level, where rich ore can be taken out whenever workmen are placed there. At the Pogonip and Othello the usual force is employed, and considerable quantities of high grade ore raised daily. No ore from this mine will be reduced until their mill is erected. The company have now on their ground and dumps about 700 tons of ore, which will be increased to thousands, for the ore is in sight, and a tunnel now connects all the shafts and exposes it to view. At the Original Hidden Treasure we saw a number of men at work, but the Superintendent being absent, we did not visit any of the underground workings of this excellent mine We heard, however, that the usual number of men—sixty-four—are employed."—POCOTILLO levied an assessment of $2 per share on the 2d inst.

PAINLESS AMPUTATION.—Mr. H. B. McMasters, of Stockton, had four fingers completely sevcred from his right hand, a few days since, by a circular saw, about which he was at work. He says he did not feel the act of amputation, and was not even aware of it until he saw the blood upon the board where he was at work. He resumed his place in the mill immediately after the wound was dressed.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Aug. 20, 1869.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

			Per ton.						*Per ton.*
12	per cent.	ore	$16 00	22	per cent.	ore	$43 56		
13	"	"	18 62	23	"	"	46 45		
14	"	"	21 20	24	"	"	49 33		
15	"	"	23 35	25	"	"	52 22		
16	"	"	26 24	28	"	"	55 11		
17	"	"	29 12	27	"	"	58 00		
18	"	"	29 91	28	"	"	60 80		
19	"	"	34 90	29	"	"	63 77		
20	"	"	37 78	30	"	"	66 66		
21	"	"	40 67	31	"	"	69 55		

These prices, we believe, will be found substantially correct, and can be realized at this date.

TO MEND PLASTER CASTS.—S. T. Clements writes to the *Dental Cosmos* that although wax and resin, shellac varnish and liquid silex are recommended for mending plaster models, neither, in his experience, can compare with sandarac varnish. Saturate the broken surfaces thoroughly, and press them well together. Allow it to dry, and the model will stand all the manipulation required.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Examination of Mines.—*Chronicle*, Aug, 7th:—Messrs. Ensign and Welch visited our most prominent mines on Friday last. The Morning Star was found to he in excellent condition, with a large body of ore in sight in the lower level, and about two hundred tons on the dump. The Tarshish is in good condition, hut no work is going on. At Silver Mountain, the Pennsylvania and I. X. L. were examined for San Francisco parties. Mr. Welch thinks the I. X. L. will prove valuable if properly worked.

The *Miner* says: "We understand that Mr. Welch in very plain terms expressed his conviction that the Pennsylvania boys were wasting their time in making further explorations there.

It is thought that if one or two more mines like the Morning Star should he opened near hy, so as to furnish sufficient ore, it would be best to put up extensive smelting works.

AMADOR COUNTY.

Anaconda.—We learn that this mine is still improving. The mill is now running on some exceedingly rich rock.

Hoisting Works.—Mr. J. A. Faull is erecting steam hoisting works on the old Amador mine at Amador City. We learn that they will he ready for use in about two weeks.

The Coney Mill.—*Dispatch*, 14th: All work was suspended at the Coney miue and mill, near Jackson, a few days ago, and all the employés discharged.

CALAVERAS COUNTY.

Lower Rich Gulch.—*Chronicle*, 14th: Alexander & Co. keep their 10-stamp battery running day and night.

Petticoat.—The chimney recently struck at the Petticoat mine at Railroad Flat, in the 200-foot level, proves to he uine feet in width. How far it extends in length is not yet known, but the level has already been run 40 feet. The rock is exceedingly rich, the probahilities being that it will yield $30 per ton hy working process.

Palomo.—The rock is paying considerably more than expenses. The shaft is down 200 feet. The indications are more favorahle than ever. The 16-stamp battery is kept constantly employed. Twenty more stamps are to he added when the shaft is sunk 200 feet deeper.

NEVADA COUNTY.

North Star.—Grass Valley *National*, Aug. 13: Mr. Hoyt, the Supt. is getting the mine in good working order. The dump-pile contains some very rich ore. There is less water in the mine now than ever before—in fact scarcely enough to keep the pumps going. The mill has heen put in apple-pie order, and will he started next week, when it is expected that a sufficient supply of rock will he on hand to keep all the stamps going day and night.

Allison Ranch.—The company is laying a foundation for the machinery to be put up at the middle shaft, to work the 16-inch pump. A 14-inch pump is now heing used in the new shaft, which keeps the mine dry to within a hundred feet of the hottom. Very rich ore, which will average over $200 per ton, is heing taken from this shaft. The ledge is only six inches thick.

Wisconsin Mine.—Same of 16th: One of the owners informs us that the company have commenced an erection of a mill for the purpose of working their own ore. They have worked dowu ou their ledge to a depth of 460 feet.

Items.—*Union*, 15th: The Eureka and Idaho work ahead without changing, and will give their usual dividends next month, provided the hanks helow will let out coiu enough to pay for the bullion. The Empire is taking out fair rock. There is no diminutiou of activity in outside prospecting, though we have no new strikes to chronicle.

Ben. Franklin.—Niuety-six loads of quartz from this mine yielded at Beu. Macauley's mill $4,300.

The Ridge.—*Transcript*, Aug. 17th: At San Juan Hill there is hut little being done. At Sebastopol, the American Co. ou Manzanita Hill has hought up eight or nine other miniug claims, and now owns about all the grouud on the hill. They now have three hedrock tunnels, and men are engaged, night and day, in ruuning oue of these in for the purpose of getting up under the new hanks. Thirty to forty men are coustantly employed, and four pipes are playing against the hauks, which are now 180 feet in hight. The cement from the channel is very hard, and au immense quantity of powder is used in blasting. The harder cement is worked in an 8-stamp mill, aud the company has hlacksmith shop, office, melting furnace and other buildings on the grouud, so that the work, even to the melting of gold into bars, is done on the ground. The yield of this mine last year was $149,000, and for a long time the yield after each run has been so uniform that for every 15 or 16 days of ten hours, from $7,000 to $8,000 can he counted on.

The Buckeye Hill claims are below Sweetland. The company is running a hedrock tunnel for Sweetland Creek, which will be 1,800 feet long. In the tunnel they employ six men day and night, and 22 at the washing, using about 500 inches of water. After the last run of six weeks the claim yielded $18,000, which is about an average. This company has an ahundance of ground, and some controversy arising, they recently bought the Granite Tunnel ground, paying therefor $60,000. The company recently had an offer of $180,000 for their ground.

At Sweetland the Kentucky Co. have fine claims on the channel. Fifteen men are employed, and 500 inches of water used.

At French Corral we learn that five or six claims are heing worked. Mr. Pollinier is putting up a 10-stamp mill.

PLACER COUNTY.

The Evening Star.—*Herald*, Aug. 19th: This mine, owned hy Heenan, Taylor, Lowry & Co., made a crushing of 33 tons some weeks ago which yielded in gold $1,307, making about $40 to the ton.

SIERRA COUNTY.

New Quartz Mill.—*Messenger*, 14th: Ned Leonard has hought the old Slug Cañon quartz mill, and intends erecting a new mill opposite the foundry, using such parts of the machinery of the old mill as are suitable. Workmen are preparing the foundation. The power will he derived from a center discharge wheel.

TRINITY COUNTY.

New Rich Diggings.—*Journal*, 14th: Clifford & Co., on the 29th of July, in Corral Creek, Lower Trinity, ohtained half an ounce as the resnlt of four hours' labor with a rocker. The gold is coarse, heavy and bright. The new mines are called the Corral Diggings, and are on the trail from Cox's Bar to Hiampom, in a large hasin of which Corral Creek is the outlet.

New River.—A communication from Pony Creek informs ns that the miners are at work as usual, and generally doing well; also that John Keach and the Portuguese Co. are preparing to go into winter quarters.

Notes of Travel.—Douglas City is looking very dull, owing to the shortness of the mining season and the fact that all river mining is closed out forever in that neighhorhood—the hed of the stream being filled with tailings from the high henches. Indian Creek has held its own pretty well. I am told most of the diggings paid well this season. At Poker Bar, on Trinity River, two men are hringing water on a high hench, above Lane's Ranch, said to prospect well. From Lewiston, up the course of the river to Von Matre's, there are three or four companies wiugdamming. Better prospects and finer-looking gravel I never saw than iu the claim owued hy John Mercer & Co. There is a fine ditch privilege heiug located aud claimed hy Mr. Chandler, commencing near Von Matre's Ranch, extending down the river 10 or 15 miles, and covering any amount of low hars which will pay from three to fifteen dollars per day to the hand. I have lived in this county eleven years, have been a practical miner during that time, have been in every mining camp, and it is my opinion that within six miles in every direction of Van Matre's Ranch is the hest mining section in Trinity River. Minersville looks very dull, but the mines iu that vicinity are paying.

The Big Ditch.—In reference to this project, the *Journal* says: "Concerning the ultimate constructiou of the Stewart's Fork ditch, we have no doubts. It not ouly offers rare inducements to capitalists as a safe and profitable investment, but it is rapidly becoming a necessity to the business interests of not only Weaverville, hut the entire county."

Arizona.

Sterling.—Prescott *Miner* July 31st: Good ore continues to he raised from the shaft of this mine. The mill will soon be in ruuning order.

Colorado.

Clear Creek.—Central City *Herald*, Aug. 11th: Major Cannon hrought over two nice bricks yesterday, which he got at Stewart's works, from Whale ore. The two together weigh 508 ounces, worth $431, the product of three tons of ore. It cost $90 to mine the three tons, $37.50 to have it delivered at the mill and $187.50 for milliug, giving a total expense of $304, which leaves a profit of $127 on the lot.

Bullion for July.—Total, in currency, $168,000; for corresponding month last year, $145,000. August opens well; the coach carried away $32,000 this morning. The prospect of a revival of some old companies which own good property, but which have heeu doing nothing for years, will likely make a considerable difference in our shipments during the closing months of the present year.

Granite District.—Partridge & Morrison are working a new lode, called the "Spondulix," which yields from $400 to $1,300 per cord. Yesterday Mr. Partridge showed us a number of specimens that were nearly all gold.

Russell.—This gulch is now a paying institution. Three quartz mills are making money there. Reed is making his Delaware property pay; Bradley is doing first rate with his new mill and another mill is also doing a fair business.

Mill City, Montana District.—Works similar to Stewart's at Georgetown, are heing huilt. The ore in Col. Hawkins lode assays from $40, up into the thousands.

Consolidated Gregory.—*Register*, 12th: Mr. Nickolls took out fourteen cords of ore last week, and is confident that he will make the mine pay largely.

The Gaston lode, between the Gregory Extension and Bates, has a crevice from eighteen to twenty-four iuches wide, at a depth of thirty-five feet, aud yields five ounces of gold hullion per cord.

Baltimore Tunnel.—We saw some ore from this tunnel which yields, by assay, $389 per ton. Several good veins will he cut hy the tunnel. They have just reached the Boaz, from which the ore ahove alluded to was taken. The indications are flattering.

Federal.—Mr. Barrett showed us a fine button of silver, weighing 13½ ounces, from eleven pounds of ore from the Federal lode, on Saxon Mountain. This indicates a working yield of over $3,000 coin value per ton.

Burleigh Tunnel.—This is now in 135 ft. The Mendota lode, the first to he pierced hy it, will he reached iu 600 ft. from the entrance. Some small veins will ho cut before reaching it.

The Terrible.—This tunnel is in 100 ft. The Burleigh drills are used.

Leavenworth Mountain.—On the north side, Matt. France is working the Heaton lode. The last 15 ft. yielded over a ton of ore worth over $500 per ton, besides several tons of second class ore worth $100 per ton. The Apache is also producing rich ore. Several other lodes yield more or less ore. The whole length of the tunnel will he 4,000 ft.

The Georgetown *Miner* states that the bullion shipments from Georgetown for July, amounted to $13,905.75, coin value, of which the Brown Co. shipped $5,056; Huependen & Co., $2,295.60; and Stewart, $6,554.15. The Brown Co. and Huepeden & Co., ruu only about one-third of the month.

Idaho.

The Bedrock Mining.—*World*, August 12th: This enterprise is satisfactorily progressing. The douhle shaft is sunk to beyond 60 feet depth, and is securely timhered all the way. The hoisting apparatus and engiue for hoisting aud pumping are in operatiou.

Silver City Items.—*Wave*, 13th: The Home Resort shaft is dowu 30 feet aud yielding very fair ore, the vein ranging from 13 inches to two feet.....The Empire holds up her prospects with three feet of vein and two of good ore....The Silver Cord mill is still at work on good looking ore and will clean up in a day or two. The mine is still holding its own in appearauce. ....The Poorman, Golden Chariot and Ida Elmore are regular producers. Corduroy and Red Jacket are heing developed with all the force available in single shafts..... We have had no report this week from the Woodstock and several other locations.

Florida Mountain still keeps up in the placer line, and a ditch has heen surveyed from the head of Jordan Creek. We are told that they propose to have water on the mountain within two months.

Bixhy has heen seen on the streets several times with good gold-hearing rock in his fists.

Leviathan.—J. L. Stewart and Dan. Edwards brought over on Tuesday the result of eight tons crushing of Leviathan ore iu Black's mill iu Flint, which yielded ahout $150 per ton. The mill is still ruuning on its own tailings, and we understand doing very well.

The *Statesman* of the 10th gives an account of a stampede to the headwaters of the middle fork of Salmon River, where a basin as large and rich as that of Boise is said to exist. It is situated 130 miles northeast from Hog'em.

Golden Chariot.—*Avalanche*, 14th: This mine looks fine. The shaft is at a depth of 320 feet, 70 feet helow the third level, from which the ore is now taken. The shaft is being sunk 90 feet, 20 of which are yet to be completed. The ore is excellent.

Emerald.—Judge Watson informs us that he has struck a fine ledge of mineral in the Emerald, thirty feet north of the discovery.

Potosi.—We visited the Potosi yesterday. Some of the hest silver ore we have ever seen, is now being taken from this mine. The ledge varies in width from a foot and a half to two feet in width. Free gold is visihle.

Poorman.—Ten tons of ore per day is extracted of fair quality. The shaft is 400 feet deep. A well-defined ledge about 1¾ feet wide is visihle in the south level.

Leviathan ore worked hy Swartz & Edwards in Black's mill, Flint, yielded at the rate of about $150 per ton. The mill is still ruuning.

Placers.—The placers on and helow Florida Mountain continue to attract attention. Several new locations were made this week.

Mills.—The New York mill is running on Golden Chariot ore. The Cosmos is pounding away ou Silver Cord rock, and the Minear is ruuning on Home Resort ore. The Webfoot mill we learn will start up in a few days.

Ida Elmore.—A tunnel has been run 1,200 feet, tapping the mine at a depth of 250 feet. It is five feet in width by six ft. in hight, substantially timbered. The level in which work is now progressing was formed at a depth of 250 feet. The main shaft is down over 30 feet below this level. The ledge at this point maintains an average width of 4½ feet, and the ore will work $100 to $125 per ton. Over the main shaft is now almost completed a substantial engine house, and connected therewith a commodious ore house, capahle of receiving 200 tons of ore. The new 25-horse power engine is in its place. There are 46 hands at work in and about the mine. The mill is in fine running trim.

Montana.

Brown's Gulch.—Virginia *Republican*, Aug. 6th:—Mr. George Adkins informs us that 2,500 lhs. of the Lorraine lode yields, to common mill process, 12 ozs. and 11 dwts. of bullion. The Pacific and Eumenia lodes yield $116 20 to the ton. By ordinary process the Pacific and Eumenia will average $60 per ton; the Romeo $75; and it will cost not to exceed $25 per ton to work them.

Midas Mill.—Jackson, at Sterling, has just put in motion a small prospecting mill for the purpose of testing the ores in that vicinity. It is operated by water power, and works twenty-five pounds of quartz to a charge. Mr. Jackson is investigating the lodes of Hot Spring district with a view to putting the Midas Mill in operation early in the fall.

Green Campbell—The first application for a patent for quartz uuder the law of Congress of 1866, has just heen made for the Green Campbell lode, in Silver Star district.

Norwegian Gulch.—Want of water is the only obstacle to want of success of the miuers. The gulch is rich, the gold of excellent quality, and the settlers determined. Kiser has made every drop available in working his claim; Clark and Fletcher, at the mouth of the gulch, have constructed a ditch for miles, which yields them all the water now controllahle.

Nevada.

COPE DISTRICT.

Good Ore.—Elko *Independent*, 11th: We were showu yesterday, au assay of ore from the Rattlesnake ledge, that returned $9,820 in silver to the ton. The ledge is of good size.

Same of 13th: Uncle John Atchison says the ledges at Cope are only about 12 or 15 inches thick, although some claims turn out rich quartz. There are about 150 people there.

Mountain City.—Same of 14th: Enright reports that several uew lodes have been discovered, aud new placer diggings found both up and dowu the Owyhee. Work is being pushed ahead on the California and Argenta, with the very best results. Col. Drew will have a mill ruuning in about 60 days. Work on a ditch to hring water ou

the placers has already begun, and will be completed in about six weeks.

Good Assay.—Ore from the Mountain City ledge assayed $1,111 per ton. Messrs. Sellers, Russels, and Hafford are the owners.

HUMBOLDT.

Unionville.—Elko *Independent*, Aug. 14th: The new mill for the National mine is being rapidly put in place on Buena Vista Creek.

The silver mining is bringing to the surface unusual quantities of superior ore, most of which will be shipped below for reduction. The mill is now undergoing some changes with a view to increasing its capacity. Fall's mills are running as usual, with very satisfactory results.

Copper.—J. J. Kellogg laid on our table yesterday some very rich specimens of copper ore, from the Union lode, Battle Mountain district. The lode is 3½ ft. wide and has been traced for 200 ft. It is only five miles from the C. P. R. R., and a good natural road all the way. Besides the copper, the ore contains $38 in gold. The selected ore will work 60 per cent. in copper.

REESE RIVER.

Mineral Hill.—News from Carlin, Aug. 13th, is as follows: The accounts brought in from Mineral Hill—the name of the new mining district south of here—have created considerable excitement, and large numbers are leaving daily for that region. Rock five ft. from the surface assays $4.50 to the ton, with ledges 15 ft. wide.

Eureka District.—Austin *Reveille*, Aug. 14th: We learn from Alderman Triplett, who returned this week from the Eureka district, that the smelting works lately erected by Mr. Stetefeldt for the Eureka Mining and Smelting Co. are in successful operation. A run of 80 hours had just been made when Mr. Triplett left, during which 8,300 lbs. of ore had been smelted—or a little over 100 lbs. per hour. The assayed value of the smelted metal was between $400 and $500 per ton in silver.

The *Reveille* thinks Austin is picking up. Some of the merchants who left it for White Pine are coming back. Every tub must stand on its own bottom. Whatever may be the case with White Pine's bottom, the *Reveille* think Austin's is sound.

WHITE PINE.

Mining Review for the Week.—*News*, Aug. 14th: The past week has been very quiet, all opposition to the reduction of wages having ceased. The Miners' League is disbanded, and six of the leaders are now lying in the County Jail for lack of money to pay their fines. No further trouble is apprehended from turbulent characters among us, as it is well known that a formidable organization of the better class of citizens stands ready to put down in future all such acts of lawlessness and crime as have lately occurred here. Work has been resumed in several of our mines during the past week, and others are expected to in a few days. Some of the mines at work have also increased their force since our last review. So many workingmen left the district during the troubles growing out of the strike that there is scarcely an an idle one to be seen on our streets, and it is probable that we shall soon find it difficult to engage the number that will be wanted. An increased amount of ore has been taken out and sent to mill the past week. The shipments of bullion the past week were as follows:

August 7th	$ 6,908 84
August 9th	6,886 56
August 10th	23,408 77
August 11th	2,396 73
August 12th	14,898 19
August 13th	6,471 87
Total	$60,940 96

We have given each day's shipment, so that no discrepancy shall appear in the published reports. The above amount is about $5,000 more than the shipments of last week.

Items.—*News*, 9th.—The Eberhardt mine has started up again with about 20 men, and will increase the number soon. We understand they are taking out some very rich ore ...Fine indications in the Silver Vault tunnel....Shaft in the David's mine is now 54 ft. Vein increased to 2 ft. in width. Ore at surface assays $17 in silver; at present depth, $140....10th: Good-looking ore from La Belle mine....A piece of ore from the Northern Light, located at Babylon in the Base Range, was shown us yesterday, which showed very well in chlorides, and assayed over $200 per ton. Though from the Base Range, it contained no base metal. There is a large vein of this ore, and several men are employed in taking out ore for reduction.. .12th: Good ore from north shaft of Pogonip and Othello. Two men take out two or three tons daily of $150 ore....Pocotillo starts up to-day with a full set of hands....13th: The John Dare Co. have struck good ore in their Bulwark location, on the eastern slope of Treasure Hill....In Mahogany Cañon, the Evening Star Consolidated is taking out as rich ore as ever. Four men are taking out good rock at Gold Hill South. Rich ore coming from Mazeppa. New York claim started up again. The California is working with a small force. ....*Empire*, 15th: The Post-hole had some 265 tons of ore crushed within the last 30 days, the highest grade yielding upwards of $1,600, the second grade $194, and the lowest $124....Eberhardt has its principal force at work in its great chamber, where more rich ores are exposed than ever before. No work is now being done in the 175-foot level, where rich ore can be taken out whenever workmen are placed there.

Mills and Smelting Works.—*News*, 9th: The Big Smoky mill, at Hamilton, turned out $40,000 in the last two weeks. It is now running on some very rich ore from the mines belonging to its owners. ....12th: The Metropolitan mill at Shermantown is closed for a few days, to make some needed repairs to the boilers. The Oasis is also temporarily closed for repairs. ....Schmolz, the assayer is constructing a brick furnace at his new place....13th: The new smelting furnace in Rutherford Cañon, near Swansea, having erected a steam engine on the premises, starts up to-day. On its first trial, a week ago, by horse-power, it turned out about 1,000 lbs. of lead bullion in about three hours. Mosheimer's smelting works are in operation, also turning out a number of bars every day. We hear this furnace is to be enlarged soon. By the way, the silver obtained by smelting is never counted in our bullion shipment....*Empire*, 10th: Logan, Lucas & Co's mill at Swansea is to be known hereafter as the Vernon mill. A bar of the value of $1,084 was turned out the other day from this mill from 1,200 lbs. of ore. It was worked up to 90 per cent. of the assay....The boilers are in place and the battery blocks are being put in place at the California mill. The building is ready for the roof. It will probably be ready to commence crushing between the 1st and 10th of next month....13th: The machinery for a 20-stamp mill, belonging to Page & Burnett, is to be taken to Mount Ophir.

Outside Districts.—*Empire*, 10th: News from Pinto favorable. We have seen samples from the Sunburst, the Southern Hope and the Pocahontas, all of which are rich in silver. One specimen from the first named mine has been left with us, and it will assay well up in the thousands.... Twenty tons of ore from the Pinto mine was recently worked at the Pinto mill, and yielded $167 per ton....11th: Ore from the Reporter mine in Keno district prospects well in gold....12th: Matters in Patterson district are beginning to look up. Martin's crusher, equal to 15 stamps, will be ready to stamp up in about two weeks. ....13th: A new mining district has been organized in the Diamond Range of mountains, 30 miles south of Pinto. The mines are said to prospect well, and the ledges are large and easily traceable. Wood and water abound....14th: Judge Lindley has spent a month at Reveille. He reports prospects excellent, but no mills. The great want is capital....15th: Spring Valley district, 65 miles west of the Diamond Range, has flattering prospects. One hundred men already at work. One hundred and fifty pounds of ore from the Harry Hamilton yielded at the rate of $40 per ton. The tailings averaged over $600 per ton.

Water Works.—*Empire* 11th :—The White Pine Water Company yesterday accomplished the feat of raising water to the tunnel and through the pipes on this side of Momomoke mountain to the reservoir at the level of the city of Hamilton. A very large volume of water was introduced.

Important Mining Decision.—*News*, 9th:—His Honor, Judge Beatty, decided recently, in the replevin suit of the South Aurora *vs.* the Autumn, to recover the bullion taken by the latter from the mining ground in dispute between them, that the plaintiff was not entitled to judgment. The decision was based upon the fact that the bullion being personal property taken from the ground in dispute, under color of title and in good faith, was not subject to replevin, for the reason that in such a suit the question of title to real estate could not be considered. The defendant having obtained possession of the property sought to be replevined, in a legal manner, and under a title equally good as that of the other party, until judicially pronounced invalid, cannot be held to have unlawfully obtained possession thereof. The fact that a suit is pending in regard to the title to the mining ground from which the bullion was taken, does not affect the rights of either party to the possession of the bullion, when that possession was obtained without fraud, and in good faith under color of title.

New Mexico.

Moreno.—The *Lantern* says: The clean up on Spanish Bar for last week was a little over $300. The mines on two or three claims on Willow Creek produce $400 each, and another $880. Pollock, at the foot of Grouse Gulch, cleaned up $681, being the result of the labor of ten men for four days. The California Co. in Humbug cleaned up $411, being at the rate of about $11 per day for every man employed. A Mexican brought into town this week some fine specimens of wire gold from a lode which he had discovered about 18 miles southwest of this place.

The Albuquerque *Review* says: Ten pounds of quartz from the Langston lode, at Pinos Altos, yielded 24¾ ounces of gold.

Oregon.

Bohemia Mines.—*Oregonian*, Aug. 7th: Messrs. Ladd and Knott arrived home Sunday. They brought with them specimens from the Excelsior, and several others. The tests of the Excelsior rock show a very fair prospect. Messrs. Ladd and Knott will immediately set about procuring a quartz mill.

Lewis River Mines.—*Register*, 6th: The excitment about the mines still continues. We were informed by Mr. Marsh that Mr. Tuke had some of the gold called shot gold. He took out eight cents to the pan. Mr. Michael Wintler says he wishes to get up no excitement, but that it will average $5 per day. The miners have organized a mining district and passed mining laws. Three hundred and sixty feet is allowed to the man. Seventy-five paying claims have already been taken up, and prospectors still flock in. The miners are mostly inhabitants of Vancouver and vicinity.

Utah.

Salt Lake.—Aug. 11th: The Woodhull Company have opened their rich galena veins in Cottonwood Cañon, 30 miles southeast of here. They have shipped fifteen tons of ore to San Francisco for reduction, and fifteen tons more are ready for shipment. The Smith Company, in Bingham Cañon, thirty miles southwest of here, have sixty tons of copper ore ready for shipment to San Francisco. Twelve tons have been already shipped for Baltimore.

Improvement in Mining.—Mining among the ancients was rude and simple. Hand washing for gold and quarrying of other metal veins near the surface were the methods first practiced. The tools found in ancient mines on this continent, are merely rough hammers of stone. Pictorial representations of Egyptian mining show criminals and prisoners of war digging ore out of the ground, crushing it into small pieces, grinding it to powder in hand mills, and washing away the refuse and earth on broad inclined planes, while the smelters are purifying the metals in crucibles. Blasting by gunpowder was introduced about 1600. Before that time shafts and horizontal galleries were excavated by hand, with great labor, and ores carried to the surface on the heads or shoulders of workmen. The earliest improvement was the windlass. The use of horse and water power successfully followed, and then the steam engine which was first applied to mining by Watt, in Cornwall. The transportation of heavy ore led to the introduction of underground wooden tramways, about 1775. These underground ways very soon led to their use above ground. The wooden string pieces were next covered with a flat iron, which 50 years later, and less than 50 ago, led to the substitution of the iron horse for the man and animal power previously employed.

Repolishing Furniture.—Oiled furniture that has been scratched or marred may be restored to the original beauty simply by rubbing boiled linseed oil, used by painters, on the surface, with a wad of woolen rags. Varnished furniture, dulled may be similarly restored by the use of a varnish composed of shellac dissolved in alcohol, applied in a similar manner. Common beeswax rubbed over furniture and heated by friction of a woolen wad briskly used, is also an excellent furniture polish.

Tropical Fruits in the Southern States.—The cultivation of the date, the sugar and the cocoanut palm, is to be tried in the Southern States. These palms furnish fruit, sugar, oil and fiber; and it is confidently expected they will flourish and become profitable in those States.

California Academy of Sciences.

The California Academy of Sciences held its regular meeting on Monday evening last—Dr. J. C. Cooper in the chair.

Maurice Dore was elected a member of the society.

Some discussion took place in regard to the scientific name of the California species of poison oak, which was finally decided to be recorded as *Rhus toxicodendron*.

Dr. Cooper said, in examining a cabinet of shells from the Straits of Fuca he had found several specimens which the Society did not possess, and which he had placed in their collection.

Dr. Gibbons called the attention of the Society to the smoky condition of the atmosphere which had prevailed for several days past. A similar phenomenon was observable at about a corresponding period last year, which was attributed to the extensive fires which had prevailed in the forests of Oregon. He had learned some weeks ago that a great conflagration was raging in the timber around Puget Sound in Washington Territory, and he had anticipated the arrival of the smoky period which was now upon us. He thought the smoky season would last a month. It was not clear in his mind what influence carried the smoke from the north down the coast. It was evident the surface currents of air which usually prevailed would not do so. It probably rose far above the surface of the earth, and was brought in this direction by an upper current of air. Many people had thought that the smoke which enveloped us for some days last year was caused by volcanoes and earthquakes. He was confident such was not the case. The smoke was caused by fires in the woods.

In reply to a suggestion that the peculiar atmospherical appearance might be due to fog, the Doctor said that when the same phenomena made its appearance last year, in a manner more marked, it was accompanied with a most unmistakeable smell of smoke. He noticed quite a strong smell of smoke, a few days since, over the Bay. The next day he was in the vicinity of and beyond Mount Diablo, when he noticed the same phenomena and smell. Smoke would sometimes travel a long distance. He had known it to travel, accompanied with particles of soot, 400 miles—from Maine to Delaware. Contrary to his early belief, he had of late years attributed the peculiar phenomenon, known at the East as the Indian summer, to smoke.

Dr. Behr said it was strange—smoke from fire in other countries did not rise and spread over vast distances. In Australia extensive fires covered the grazing country, and at night the fire could be seen for miles on the hills, twisting and writhing like serpents over vast extents. The people burned the old growth in order to let the young grass grow for stock, and the fires were permitted to burn, but the smoke did not extend beyond the distance at which the flames could be seen. He said in Russia the smoke did not spread over the country, and was not felt. In Germany a smoke was seen and felt which for a long time could not be accounted for, but which was now generally conceded to have its origin in the burning turf, a bed of which extended from the sea shore to the Alps.

Dr. Gibbons said smoke and wind were incompatible. In the East the first day's wind always entirely dispelled the haze of Indian summer.

Dr. Behr remarked that the atmosphere had a great effect upon smoke. Some days it would rise straight up in the air, and other days would creep about the roofs of the houses. He thought, in considering the nature and action of smoke, the effect of the atmosphere upon it would form an important part of the study.

The Chair said eminent geologists had decided that smoke issuing from volcanoes contained no carbon whatever.

Dr. Gibbons said that smoke from volcanoes was probably part ashes, and was chiefly composed of unconsumed mineral matter.
